Every woman may virtually protect herself and her family from sickness by laying in a good big store of fruit and fruit products for everyday use the year round.

Pennsylvania Grange Celebrates Semi-Centennial

OLIVER D. SCHOCK

THE Fiftieth anniversary of the organization of the Pennsylvania State Grange was celebrated with special exercises in Reading, on Thursday evening, September 20. Berks, Lehigh, Lebanon, Schuylkill, Lancaster, Northampton, Bucks and other counties were represented. It was in Berks County that the first meeting was held under the leadership of the late D. B. Mauger. John F. McSparran, Master of the State Grange, Fred Brenckeman, secretary and David F. Mauger, whose father organized the State Grange movement, were among the speakers. The grangers of Pennsylvania now number almost 100,000.

* * *

About one score Pennsylvania counties will be represented at the Syracuse, New York, cattle exhibitions by organized delegations. This National show will also attract many Pennsylvania dairymen. Some of the county delegations will travel by automobiles in preference to train service, as they can beat the average train schedules.

* * *

The several State newspaper associations at a recent meeting made a concerted attack upon the present system of tax assessments. It was declared that it was unfair and that tax revision was a public necessity. A plan proposed during the last days of the session of the Legislature met with defeat. The late Thomas J. Edge, Secretary of the State Board of Agriculture and the writer hereof, made an extensive research into the problem years ago which at least temporarily produced valuable results for the agricultural classes.

* * *

With an exceptionally cold early Fall season and occasional showers, apples are developing splendidly both in size and color and orchardists predict a profitable season. Spraying was more prevalent than in any previous season, and the fruit will be harvested in a clean condition. Last year scab was very troublesome. The Stayman, Wine-sap and York Imperial again lead in production, and are planted commercially to a greater extent than any other varieties.

The Negro in Southern Agriculture

(Continued from page 206)

tion which will convert an ignorant and frequently criminal immigrant from southeast Europe will do the same for the negro. We have failed to realize that the educated negroes in the North and South are the ones who have the most self-respect and conscience. The first step our missionaries take in foreign fields is to educate those whom they would Christianize.

What we need is not only more and better elementary schools, but we should provide more schools for technical training so that they may learn the advantages of scientific farming or become fitted for some vocation. Teach the negro how to use his hands; give him a chance to read a daily newspaper, let him have a letter now and then from his children, and the day of assaults, lynchings, and violence will disappear.

When he proves himself capable, he should be allowed to own a piece of land, for in every case where they have had a chance to own land they have made better farmers and better citizens.

We must not fail to remember that wherever our life touches the negro we make him stronger or weaker, and that in turn he will help or hinder us. You men of New York State must remember that the backwardness of the South is your backwardness and in-so-much lowers the standards of your civilization. Man drags man down or lifts him up. I look into the past and a dream of the future arises. I see a South that has learned to appreciate the negro and has given him a chance that has so long been denied him. It is no longer a section of ignorance, and crime, and backwardness, but a country of happiness and an agricultural section second to none in the world.

General Motors Trucks

GMC Truck Economy For Farm Use Is Easily Understood

Why do farmers find GMC's the most economical trucks with which to meet the strenuous conditions of farm transportation?

There are two reasons: the remarkably low list price and inexpensive maintenance cost of every GMC model—and the continuous and dependable transportation these trucks provide.

GMC trucks offer the highest quality for the least money because they are built by a division of General Motors Corporation—the largest automotive concern in the world.

It is impossible to build a truck of GMC quality cheaper than this organization can build it. And to this actual cost of manu-

facture, GMC adds only a fair profit—without "extras" or "margins" of any kind.

Hence GMC trucks are the lowest priced trucks, for their quality, on the market. And because of their high quality—they provide continuous and dependable transportation, year in and year out, despite the hard usage to which trucks are so often put on the farms.

You will be interested in knowing all of the many actual superiorities that GMC trucks offer. They are completely discussed in our catalog "Motor Trucks on the Farm". We will gladly mail you a copy—send us your name.

GENERAL MOTORS TRUCK COMPANY—Pontiac, Michigan

The School Bill and The Farmers' Taxes

(Continued from page 207)

rural schools. Of this aid, direct from the State, the cities would pay approximately 87 per cent. Therefore, if school facilities should remain as they are, and no improvements be made, school taxes of rural patrons would be greatly reduced in a great majority of the rural school districts, and if the rural people wished, under this provision of the bill, better teachers could be hired, and more facilities, equipment and repairs put into the school buildings to the extent of ten million dollars, without increasing local taxes.

If you do not remember anything else in this article we hope you will this, because it is the most important point and the one least understood.

Largest State Aid to Poorest Districts

The community plan of taxation will equalize taxes among the districts in the same communities. There will, of course, still be inequalities among the taxes of different community districts. To partially overcome this and to encourage the weaker schools to get better teachers and equipment, the proposed bill provides for distributing the State aid to the weaker districts which need it the most and to those districts which make the most effort to help themselves to better schools through hiring well-prepared teachers, etc.

Putting it another way, State aid would be apportioned in accordance with the taxable resources of community districts and expenditures which such districts are required to make to provide for the maintenance of their public schools. State aid would be given on the basis of valuation per teacher. The State standard of actual valuation per teacher is fixed in the bill at \$300,000. Community districts which would have a true or actual valuation per teacher of less than this amount would be entitled to receive from the State a certain percentage of the total amount of their expenses during the current year.

If the true valuation per teacher in the community district decreases, the State aid would be increased. For example, a community district having a true valuation of \$100,000 per teacher would receive 66⅔ per cent of its total maintenance cost from the State. A district having a \$30,000 actual valuation for each teacher would receive 90 per cent of its maintenance cost from the State. Each district also would receive at least \$200 for each teacher employed.

Provision is made too for more State aid in the erection of buildings and for the transportation of high school pupils. Most districts have a valuation per teacher of much less than \$300,000.

As a concrete example, in the town of McDonough in Chenango County, the equalized valuation for the year 1921-22 was \$297,472. The equalized or true valuation per teacher was \$42,496. This valuation per teacher, according to the plan in the proposed bill, would make the percent of State aid for McDonough 86. The school expenses in McDonough for 1921-22 were \$11,481.91. Under the present law, this town received from the State \$4,849.21. Under the new law, it would have received \$9,874.44. If it had built any school buildings, the State would have paid 30 per cent of their cost. In other words, had the new bill been in operation in 1921-22, this town would have received more than twice as much help from the State as it received under the present law. These figures are only approximate, because the apportionment would be made on a community

unit basis instead of using a town for a basis.

Let us take one more example of a richer town where the valuation per teacher is higher. In the town of Afton, in Chenango County, the valuation per teacher was \$102,606 for 1921-22. This would bring the per cent of State aid under the new bill to 66. The school expenses in that town for 1921-22 were \$28,603.69. Under the present law the town received \$13,838.84 from the State. Under the new bill, it would have received \$18,878.44, besides the help which the State would have given had there been any school buildings erected.

In order to be perfectly clear, however, we want to repeat that there would be rich districts where the school taxes are now too low, compared with what other farmers have to pay in poorer districts, which would no doubt pay some higher taxes than they do now because of the equalization provision in the bill. But after all, while the farmers must be determined to keep taxes of all kinds within reasonable limits, the majority of them look upon money that is well spent in maintaining good schools as an investment and not as a expense.

In future issues, we will discuss other features of the proposed bill and answer specific questions in regard to it.

The Stranger Within Our Gates

(Continued from page 210)

dition and not a theory that confronts us," for the alien has come to our farms and in the East the movement is apparently just beginning. We can choose either one of two courses toward these strange peoples. We can bid them flock by themselves and serve warning notice that we want no dealings or contact or fellowship with them and if so we may have little Italys and Russias and Polands and Jewrys scattered all over our farm country—or we may choose the other course—frankly recognize that they are with us whether we will or not and then do what we can in every way to build up a spirit of neighborliness and kindness and good will and mutual regard. I know that the foreigner is often hungry for a word of appreciation and good cheer and that he will not repel our advances. "Americanization"—a word of which we hear much—is not solely a problem of the big cities and the mining regions. I know where it has come to the remote Hill Country of the State. It is a work in which the school and the Grange can easily have a part. The Farm Bureau can be especially useful for the immigrant turns to it very easily and naturally and not infrequently is a more loyal supporter than the native farmer. The Protestant Church may not find it easy to get in touch with the eastern European, but I do feel very sure that he is a human being who will respond to genuine kindness and interest and good will.

In meeting the alien thus we shall show ourselves worthy of that high characterization: "tolerant" and tolerance I take it is one of the fine products of education and contact with the world whereby we acquire the grace to see both sides of a question and to overlook some of the ways in which other folk differ from us folk.

All of which is respectfully submitted to my good friends who do not see this question of the immigrant eye to eye with me.

At the World's Dairy Congress, which meets in Washington, October 2 and 3; in Philadelphia, October 4, and at the National Dairy Show from October 5 to 10, there will be a program of speakers on dairy subjects from 37 governments of the world. Over half of the speakers will be foreigners, many of whom will deliver their addresses in their own official language; but provision will be made for interpreting, and no English-speaking person will have any difficulty in following the proceedings. The Congress will be welcomed in Washington by President Coolidge.

The Broad Highway—By Jeffery Farnol

"PETER," said Sir Richard suddenly. "You never saw your father to remember, did you?"

"No, Sir Richard."

"Nor your mother?"

"Nor my mother?"

"Poor boy—poor boy!"

"You knew my mother?"

"Yes, Peter, I knew your mother," said Sir Richard, staring very hard at the chair again, and I saw that his mouth had grown wonderfully tender. "Yours has been a very secluded life hitherto, Peter," he went on after a moment.

"Entirely so," said I, "with the exception of my never-to-be-forgotten visits to the Hall."

Sir Richard coughed and grew suddenly red.

"Why—ah—you see, Peter," he began, picking up his riding whip and staring at it, "you see your uncle was never very fond of company at any time, whereas I—"

"Whereas you could always find time to remember the lonely boy left when all his companions were gone on their holidays—left to his books and the dreary desolation of the empty schoolhouse."

"Pooh!" exclaimed Sir Richard, redder than ever. "Bosh!"

"Do you think I can ever forget the glorious day when you drove over in your coach and four, and carried me off in triumph, and how we raced the white-hatted fellow in the tilbury—?"

"And beat him!" added Sir Richard.

"Took off his near wheel on the turn," said I.

"The fool's own fault," said Sir Richard.

"And left him in the ditch, cursing us!" said I.

"Egad, yes, Peter! Oh, but those were fine horses—and though I say it, no better team in the south country."

"And later, at Oxford," I began.

"What now, Peter?" said Sir Richard, frowning darkly.

"Do you remember the bronze vase that used to stand on the mantelpiece in my study?"

"Bronze vase?" repeated Sir Richard, intent upon his whip again.

"I used to find bank-notes in it after you had visited me, and when I hid the vase they turned up just the same in most unexpected places."

"Young fellow—must have money—necessary—now and then," muttered Sir Richard.

At this juncture, the butler appeared to announce that Sir Richard's horse was waiting. Hereupon the baronet caught up his hat and gloves, and I followed him out of the house and down the steps.

SIR RICHARD drew on his gloves, thrust his toe into the stirrup, and then turned to look at me over his arm.

"Peter," said he. "Regarding your walking tour—"

"Yes?"

"I think it's all tomfoolery!" said Sir Richard. After saying which he swung himself into the saddle with a lightness and ease that many younger might have envied.

"I'm sorry, sir, because my mind is set upon it."

"With ten guineas in your pocket!"

"That should be ample until I can find some means to earn more."

"A fiddlestick, sir—an accursed fiddlestick!" snorted Sir Richard. "How is a boy, an unsophisticated, hotheaded young fool of a boy to earn his own living?"

"Others have done it," I began.

"Pish!" said the baronet.

"And been the better for it in the end."

"Tush!" said the baronet.

"And I have a great desire to see the world from the viewpoint of the multitude."

"Bah!" said the baronet, so forcibly that his mare started; "this comes of your Revolutionary tendencies. Let me tell you, Want is a hard master, and the world a bad place for one who is moneyless and without friends."

"You forget, sir, I shall never be without a friend."

"God knows it, boy," answered Sir Richard, and his hand rested for a moment upon my shoulder. "Peter," said he, very slowly and heavily, "I'm growing old—and I shall never marry—and sometimes, Peter, of an evening I get very lonely and—lonely, Peter." He stopped, gazing away towards the green slopes of distant Shooter's Hill. "Oh, boy!" said he at last, "won't you come to the Hall and help me to spend my money?"

Without answering I reached up and clasped his hand; it was the hand which

held his whip, and I noticed how tightly he gripped the handle, and wondered.

"Sir Richard," said I at last, "wherever I go I shall treasure the recollection of this moment, but—"

"But, Peter?"

"But, sir—"

"Oh, dammit!" he exclaimed, and set spurs to his mare. Yet once he turned in his saddle to flourish his whip to me ere he galloped out of sight.

CHAPTER II

I SET OUT

THE clock of the square-towered Norman church, a mile away, was striking the hour of four as I let myself out into the morning. It was dark as yet, and chilly, but in the East was already a faint glimmer of dawn. Reaching the stables, I paused with my hand on the door-hasp, listening to the hiss, hissing that told me Adam, the groom, was already at work within. As I entered he looked up from the saddle he was polishing and touched his forehead with a grimy forefinger.

"You be early abroad, Mr. Peter."

"Yes," said I. "I wish to be on Shooter's Hill at sunrise; but first I came to say good-by to Wings."

"To be sure, sir," nodded Adam, picking up his lantern.

Upon the ensuing interview I will not dwell; it was affecting both to her and to myself, for we were mutually attached.

"Sir," said Adam, when at last the stable door had closed behind us, "that there mare knows as you're a-leaving her."

"I think she does, Adam."

"This is a bad day for Wings, sir—and all of us, for that matter."

"I hope not, Adam."

"Everything to be sold under the will, I think, sir?"

"Everything, Adam."

"Excuse me, sir," said he, knuckling his forehead, "you won't be wanting ever a groom, will you?"

"No, Adam," I answered, shaking my head, "I shan't be wanting a groom."

Here there ensued a silence during which Adam knuckled his right temple again and I tightened the buckle of my knapsack.

"Good-by, Adam!" said I, and held out my hand.

"Good-by, sir." And, having shaken my hand, he went back into the stable.

So I set off, walking beneath an avenue of trees looming up gigantic on either hand. At the end was the lodge and, ere I opened the gates—for John, the lodgekeeper, was not yet astir—I paused for one last look at the house that had been all the home I had ever known. As I stood thus, with my eyes upon the indistinct mass, I presently distinguished a figure running towards me and, as he came up, recognized Adam.

"It ain't much, sir, but it's all I 'ave," said he, and thrust a short, thick, well-smoked clay pipe into my hand—a pipe that was fashioned to the shape of a negro's head. "It's a good pipe, sir," he went on, "a mortal good pipe, and as sweet as a nut!" saying which, he turned about and ran off, leaving me standing there.

And having put the pipe into an inner pocket, I opened the gate and started off at a good pace along the broad highway.

It was a bleak, desolate world that

lay about me, a world of shadows and a white, low-lying mist that filled every hollow and swathed hedge and tree; a lowering earth and a frowning heaven infinitely depressing. But the eastern sky was clear with an ever-growing brightness: hope lay there, so, as I walked, I kept my eyes towards the East.

Being come at last to that eminence which is called Shooter's Hill, I sat down upon a bank and turned to look back upon the wonderful city. And as I watched, the pearly East changed little by little, to a varying pink, which in turn slowly gave place to reds and yellows, until up came the sun in all his majesty, gilding vane and weathercock upon a hundred spires and steeples, and making a glory of the river.

"Truly," said I to myself, "nowhere in the whole world is there such another city as London!" And presently I sighed and, rising, set my back to the city and went on down the hill.

Yes—the sun was up at last, and at his advent the mists rolled up and vanished, the birds awoke in brake and thicket and, lifting their voices, sang together. Bushes rustled, trees whispered, while from every leaf and twig, from every blade of grass, there hung a flashing jewel.

With the mists my doubts of the future vanished too, and I strode upon my way, king of my destiny, walking through a tribute world where feathered songsters carolled for me and blossoming flowers wafted sweet perfume upon my path. So I went on gayly down the hill, rejoicing that I was alive.

In the knapsack at my back I had stowed a few clothes, the strongest and plainest I possessed, together with a shirt, some half-dozen favorite books, and my translation of Brantôme; and in my pocket was my uncle George's legacy—namely, ten guineas in gold. And, as I walked, I began to compute how long such a sum might be made to last. By practising the strictest economy, I thought I might manage well enough on two shillings a day, and this left me some hundred odd days in which to find some means of livelihood, and if a man could not suit himself in such time, then (thought I) he must be a fool indeed.

Thus, my thoughts caught something of the glory of the bright sky above and the smiling earth about me, as I strode along that "Broad Highway" which was to lead me I knew not whither, yet where disaster was already lying in wait for me—as you shall hear.

CHAPTER III

CONCERNS ITSELF MAINLY WITH A HAT

AS the day advanced, the sun beat down with an ever-increasing heat, and what with this and the dust I presently grew very thirsty; wherefore, as I went, I must needs conjure up tantalizing visions of ale—of ale that foamed gloriously in tankards, and gurgled deliciously from the spouts of earthen pitchers, and I began to look about me for some inn where these visions might be realized and my burning thirst nobly quenched. On I went, through this beautiful land of Kent, past tree and hedge and smiling meadow, by hill and dale and sloping upland, while ever the sun grew hotter, the winding road dustier, and my mighty thirst mightier.

At length, reaching the brow of a hill, I espied a small inn that stood back from the glare of the road, and joyfully I hastened toward it.

As I approached I heard loud voices, raised as though in altercation, and a hat came hurtling through the open doorway and, bounding into the road, rolled over and over to my very feet. I saw that it was a very ill-used hat, frayed and worn, dented of crown and broken of brim, yet beneath its sordid shabbiness there lurked the dim semblance of what it had once been, for, in the scratched and tarnished buckle, in the jaunty curl of the brim, it still preserved a certain pitiful air of rakishness; wherefore, I stooped, and, picking it up, began to brush the dust from it.

I was thus engaged when there arose

a sudden bull-like roar and, glancing up, I beheld a man who reeled backwards out of the inn and who, after staggering a yard or so, thudded down into the road and so lay, staring vacantly up at the sky. Before I could reach him, however, he got upon his legs and, crossing unsteadily to the tree I have mentioned, leaned there, and I saw there was much blood upon his face which he essayed to wipe away with the cuff of his coat. Now, upon his whole person, from the crown of his unkempt head down to his broken, dusty boots, there yet clung that air of jaunty, devil-may-care rakishness which I had seen, and pitied in his hat.

Observing, as I came up, how heavily he leaned against the tree, and noting the extreme pallor of his face and the blank gaze of his sunken eyes, I touched him upon the shoulder.

"Sir, I trust you are not hurt?" said I.

"Thank you," he answered, his glance still wandering, "not in the least—assure you—merely tap on the nose, sir—unpleasant—but no more, no more."

"I think," said I, holding out the battered hat, "I think this is yours?"

HIS eye encountering it in due time, he reached out his hand somewhat fumblingly, and took it from me with a slight movement of the head and shoulders that might have been a bow.

"Thank you—yes—should know it among a thousand," said he dreamily, "an old friend and a tried—a very much tried one—many thanks." With which words he clapped the much-tried friend upon his head, and with another movement that might have been a bow, turned short round and strode away. And as he went, despite the careless swing of his shoulder, his legs seemed to falter somewhat in their stride and once I thought he staggered; yet, as I watched, half minded to follow after him, he settled his hat more firmly with a light tap upon the crown and, thrusting his hands into the pockets of his threadbare coat, fell to whistling lustily, and so, turning a bend in the road, vanished from my sight.

And presently, my thirst recurring to me, I approached the inn, and descending three steps entered its cool shade. Here I found four men, each with his pipe and tankard, to whom a

THE START OF THE STORY!

TO inherit his uncle's fortune, Peter Vibart must, within six months, marry the Lady Sophia Sefton, a famous beauty. His cousin Maurice, whom he has never seen, can win the money on the same condition.

But Peter, in spite of Sir Richard's friendly offers, prefers to take to the road, with the ten guineas left him by his uncle. He declares the dashing Lady Sophia (whom he has also never seen) a termagant, and horrifies his friend by his democratic tastes.

large, red-faced, big-fisted fellow was holding forth in a high state of heat and indignation.

"Wot's England a-comin' to?—that's wot I wants to know," he was saying; "wot's England a-comin' to when thiev-in' robbers can come a-walkin' in on you a-stealin' a pint o' your best ale out o' your very own tankard under your very own nose."

"Ah!" nodded the others solemnly, "that's it, Joel—wot?"

"W'y," growled the red-faced innkeeper, bringing his big fist down with a bang, "it's a-comin' to per—dition; that's wot it's a-comin' to!"

"And wot," inquired a rather long, bony man with a face half-hidden in sandy whisker, "wot might per—dition be, Joel; likewise, wheer?"

"You must be a danged fule, Tom, my lad!" retorted he whom they called Joel, redder in the face than ever.

"I only axed wot an' wheer."

"Only axed, did ye?" repeated Joel scornfully.

"Wich I notice," retorted the man

BOOKS *THE BARGAIN* *of the YEAR!*

FICTION clean, thrilling, romantic, amusing—it's all here and within the reach of every farm family.

"THE DUDE-WRANGLER" IN ACTION

up by some more fortunate buyer if you tarry. In order to convince you of the need of acting promptly, we also will send you

FREE—A Beautiful Story, "PAYING MOTHER"

Mother can't be paid for all she does—but this beautiful gift book, sent with our compliments, tells what happened to one family's wonderful Mother.

While they last—a copy of "PAYING MOTHER" **FREE**, to everyone who orders three or more of our special bargain list. The book, by Margaret Hill McCarter, is beautifully bound and illustrated. It will be a permanent addition to your library. **So get your order in the mail today.**

Remember three volumes of fiction for the price of one! Additional single copies 75c apiece. Fill out the coupon below, ordering by the number of the volumes you want. **SEND NO MONEY.**

You pay, on delivery of the books at your door, \$1.98 plus a few cents for postage. And you get one extra volume, "Paying Mother," free, with our compliments, as long as the supply holds out.

THIS IS THE WONDERFUL LIST OF BARGAIN BOOKS

- | | |
|---|--|
| (1) THE MARDI-GRAS MYSTERY Bedford-Jones
The midnight masquer—who is he; why does he rob his victims and return the jewels later? Two men who love a girl are rivals in solving the mystery. | (12) A VIRGINIA SCOUT Hugh Pendexter
How a vast section of the continent was saved to the Union—intrigue, Indian warfare, pioneering, love and high reward. |
| (2) THE DUDE-WRANGLER Caroline Lockhart
Wallie, the porch-darling, gets the wild and woolly west fever. What happens to Wallie makes hilarious reading—but he puts it over just the same. | (13) KINGS OF THE MISSOURI Hugh Pendexter
The exploration of an empire and the romance of the fur traffic in a day that is gone—breathless adventure and an absorbing story. |
| (3) IN THE FAVOUR OF THE KING Daniel Hawthorne
Old Mexico—brave men, villainous conspirators, beautiful women, and the lure of gold and power. A story of heart-stirring adventure. | (14) TOLO IN THE EAST Talbot Mundy
Spice-fed, heat-cracked is the languorous, mysterious land of India, where red mutiny alternates with native loyalty and the story is always worth telling. |
| (4) PARADISE BEND William Patterson White
Two gunmen, a flirtatious girl, a horse-stealing plot foisted single-handed by a humble cow-puncher. A tale of hard riding, quick-shooting men. | (15) A SECRET OF THE SEA William Allison
A lost bride, an abandoned ship, an apparently hopeless love affair—mystery, thrills, and a last-minute rescue. |
| (5) "WITH THE HELP OF GOO AND A FEW MARINES" Brig. Gen. A. W. Catlin
History in the making, told of by one who helped make it. An American epic which every family should be proud to read and own. | (16) THE FIRST CHRISTMAS Lew Wallace
Exquisitely bound in red leather and gold, this little volume, a reprint of the most beautiful part of BEN HUR, makes a perfect gift. |
| (6) NORTH OF THE LAW Samuel Alexander White
A rescue that will stir your blood starts this thrilling novel, and shipwreck, rivalry, plotting and revenge run through its every page. | (17) SWEET ROCKET Mary Johnston
A fine old home, beauty, mysticism and an abiding love are told of in this highly spiritual and beautiful story by a favorite American writer. |
| (7) THE DARK MIRROR Louis Joseph Vance
Which was she—society girl or crime-ridden product of the slums? A dual nature, a brave, high-spirited heroine and a hero who solves the mystery. | (18) MICHAEL FORTH Mary Johnston
The merging of the old South and the new is depicted in this masterly novel, which has for its underlying theme the strength of human love and the belief in immortality. |
| (8) THE HEART OF THE RANGE William Patterson White
How an "old maid" brings havoc to the heart of a cow-puncher and how he uncovers a plot, wins his battles and—the girl. | (19) THE BEAUTY AND THE BOLSHEVIST Alice Duer Miller
Witty, sparkling and swift moving is this highly modern story of a capitalist, a young Socialist and beauty, the umpire—and the prize, too! |
| (9) THE LION'S MOUSE C. N. & A. M. Williamson
They meet on a train, they are married at the journey's end. Then begins mystery, doubt, and the test of love which triumphs in the end. | (20) BROKEN TO THE PLOW Charles Caldwell Oobie
How an underdog is put through the mill by unscrupulous interests and how in a moment of desperation his manhood is born, make an absorbing and powerful story. |
| (10) STUBBLE George Looms
Everyday life, everyday people—yet the story is anything but commonplace, because it is human and lovable and readable. | (21) MY TRIP ABROAD Charlie Chaplin
When Charlie hit Europe, the sparks began to fly. He was kissed by celebrities and cheered by mobs and generally lionized. Humor, pictures and a vein of serious philosophy. |
| (11) THE SEEDS OF ENCHANTMENT Gilbert Frankau
A lost colony of French men and women in the heart of China—strange, exotic adventures and a climax of amazing dramatic power. | |

Growing Flowers Indoors

The Right Sort of Basket—Pumpkin Recipes

THE hanging basket adds to the attractiveness of the bay window or every side window. It is not easy to grow a good plant in a hanging basket, but with the right kind of a basket and the right plant beautiful specimens have been grown.

A friend of mine bought a hanging basket from a mail order house last fall that is my idea of what such a basket should be. Inside was a red clay pot with straight sides and as deep as it was wide, with rounded bottom. Under this was a metal pan that held a good supply of water, and a sponge ran up through a hole in the bottom of the pot. A green moss covering hid the whole except a lip to the pan for pouring water into it. Fine mesh hardware wire held the moss in place. The drainage was rather fine and pressed in around the sponge and the soil was watered from the pan be-

mallow may be placed on top of each cup and slightly browned in the oven.

Since it does require a little extra time to cut up and cook a pumpkin, why not do two at the same time and can the extra quarts, to be used whenever needed? Boil down the pumpkin until quite dry, then put in sterilized jars and seal.

Squash is used principally as a vegetable, though it can be substituted for the pumpkin in the above recipe. Baked squash is delicious, and is easily prepared, as the peeling does not have to be removed. The only preparation it requires is to be cut up in convenient pieces for serving and baked until tender.

Steaming is a better way of cooking squash than boiling, as the flavor is better, there is no loss of mineral content and it is less watery. Scalloped squash is a well-liked dish made as follows: 2 eggs (beaten light), 4 cups steamed or mashed squash, 1 cup milk, 1 tablespoon melted butter, salt, pepper.

Mix all well and turn into a greased baking dish. Sprinkle with bread crumbs and bits of butter and bake until set.

The Broad Highway

(Continued from page 215)

Tom, blowing into his tankard, "w'ich I notice as you ain't never over-fond o' answerin'."

Seizing the occasion that now presented itself, I knocked loudly upon the floor with my stick, whereupon the red-faced man, removing his eyes slowly from the unconcerned Tom, fixed them darkly upon me.

"Supposing," said I, "supposing you are so very obliging as to serve me with a pint of ale?"

"Then supposin' you show me the color o' your money?" he growled, "come, money fust; I aren't takin' no more risks."

For answer I laid the coins before him. And having pocketed the money, he filled and thrust a foaming tankard towards me.

"Why, ye see, sir," he began, somewhat mollified, "it be precious 'ard to know who's a gentleman, an' who ain't; who's a thief, an' who ain't these days."

"How so?"

"Why, only a little while ago—just afore you—chap comes a-walkin' in 'ere, no account much to look at, but very 'aughty for all that—comes a-walkin' in 'ere 'e do an' calls for a pint o' ale—you 'eard 'im, all on ye?" He broke off, turning to the others; "you all 'eard 'im call for a pint o' ale?"

"Ah—we 'eard 'im," they nodded. "Comes a-walkin' in 'ere 'e do, bold as brass, calls for a pint o' ale—drinks it off, an'—ands me 'is 'at; you all seen 'im 'and me 'is 'at?" he inquired, once more addressing the others.

"Every man of us," the four chimed in with four individual nods.

"Wot's this 'ere?" says I, turnin' it over. 'It's a 'at, or once was,' says 'e. 'Well, I don't want it,' says I. 'Since you've got it you'd better keep it,' says 'e. 'Wot for?' says I? 'Why,' says 'e, 'it's only fair seein' I've got your ale—it's a case of exchange,' says 'e. 'Oh! is it?' says I, an' pitched the thing out into the road an' 'im arter it—an' so it ended. An' wot," said the red-faced man nodding his big head at me, "wot d' ye think o' that now?"

"Why, I think you were perhaps a trifle hasty," said I.

"An' for why?"

"Well, you will probably remember that the hat had a band round it—"

"Ay, all wore away it were too—"

"And that in the band was a buckle—"

"Ay, all scratched an' rusty it were—well?"

"Well, that tarnished buckle was of silver—"

"Silver!" gasped the man, his jaw falling.

"And easily worth five shillings, perhaps more, so that I think you were, upon the whole, rather hasty." Saying which, I finished my ale and, taking up my staff, stepped out into the sunshine.

(To be Continued)

THE WOODEN SPOON AND SPATULA

TWO of the handiest tools about the kitchen are the wooden spoon and spatula.

The advantages of the former are:

1. Prevents burned fingers.
2. Absence of metallic taste.
3. No discoloration, as when a metal spoon is used in food products containing sulphur (onions, eggs etc.) or acid.
4. Minimizes the noise of stirring. A decided advantage when the youngsters want to cook.
5. Prevents wear on, and bending of metal spoons.
6. Food does not stick as badly to a wooden spoon and you will have fewer lumps.
7. No scouring as in the case of metal spoons.

USES OF THE SPATULA

1. For mixing dry ingredients and for the "folding in" process.
2. For spreading icings, merin-gues, etc.
3. For turning fried foods.
4. For scraping batter from pans. This makes for economy and ease in cleaning.
5. For lifting soft dough biscuits and cookies into the pan before baking, and for removing them from the pan.

low by soaking up through this sponge. Difficulty in watering and small room for roots of plants have always been the trouble with hanging baskets and this one avoids both. It holds as much soil as pots of the same size and is as easily watered, and always from below, which is as it should be.

Asparagus sprengeri is the plant my friend is growing in her basket, but there are several fine hanging basket plants, especially for this basket which can be kept moist. Bermuda buttercup, oxtails, lantana (weeping) wandering Jew are three that stand neglect pretty well, and ivy geraniums, apple geraniums, and several other trailing favorites may be grown instead with good care. There is very little danger of over watering with this basket and you can always tell the condition of the soil by feeling it at the surface. It is not best to keep the pan continually full of water unless the plant uses it.—RACHAEL RAE.

NEW WAY TO COOK PUMPKINS

Some people think there is only one use for pumpkin and that is pie. This is the most common way of preparing it, but have you ever thought of serving pumpkin custard? This is how you make it: 1 1-2 cups steamed or strained pumpkin, 2-3 cup brown sugar, 1 teaspoon cinnamon, 2 cups milk, 1-2 teaspoon salt, 2 eggs.

Mix the ingredients in the order given and bake in a moderate oven until a silver knife inserted in the custard comes out clean. A marsh-

The Practical Housewife

Suggestions to Shorten Her Working Day

HURRY at a critical moment makes weariness on a "rush" day. Many things may be done the day before on a threshing or corn-cutting bout.

I get out extra dishes, stored away in a seldom-used cupboard, and see that they are free from dust. Stored silver is apt to need a little polishing. Salt and pepper shakers are filled, and so are sugar bowls, vinegar bottles and the like. Extra chairs are brought from the store-room and dusted. Plenty of clean towels and soap are placed where the men can get them for themselves.

If it is advisable to have the men wash on the back porch, get everything ready as far as possible. Put the extra leaves in the table.

Gathering and scrubbing the vegetables can just as well be done the day before. There is generally an element of uncertainty in the coming of the men on such occasions and one does not care to prepare a great amount of food before they actually arrive. But the day before, pie-crust can be mixed to the stage of moistening and set away, well covered in a cool place, and so can a mixture of flour, shortening, salt and baking powder for biscuits or dumplings. The dry ingredients for corn bread and brown bread may be carefully sifted ready for a quick mixing. All these things help wonderfully when the rush is actually on.—ALICE MARGARET ASHTON.

TRY MAKING BURLAP RUGS

One of the greatest problems confronting country wives is that of floor coverings. They do not like to spend money for really good rugs for the rough usages of the average country home, and the cheaper ones are not worth buying.

Rugs, both large and small, made of used burlap sacks make an inexpensive, lasting and nice looking rug

and with a little trouble may be made beautiful. They take dye nicely, especially dull greens, browns and yellows with but little attention. Cut as for regular rag carpet, except wider. The warp costs little, since only about half as much is used as for rag carpet; it shrinks into the soft meshes of the burlap, is hidden and protected.

There are always looms in the country where one can get them woven for a trifle, and I'll venture that enough old sacks are eaten by rats or destroyed by mildew to carpet a large portion of the county. This is something really tried out and practical, and is a pleasant variation from the pretty, old-fashioned braided rugs, which are not as durable. Three yard-wide strips four yards long, woven with a border at the end and sewed together, makes a 9x12 all over rug, pretty enough for any living room. Four burlap sacks, if not too badly damaged, will cut enough rags for one square yard.—MRS. R. G. ARMSTRONG.

DO YOU KNOW THAT—

Use a tablespoonful of kerosine in water for washing window lights; the glass will be clear and with less labor.

* * *

A little borax in starch gives clothes a nice gloss and prevents stiffness coming out so quickly.

* * *

Left-over cherry juice will clean your silver. Just use some left-over juice or a few cherries. Let juice come to a boil, then lay silver in it, and in a few minutes, it will be as bright and clean as new.

* * *

Add a tablespoonful of ammonia to two quarts of water for watering house plants and wash the leaves of calla lilies and begonia with it. They will look better and grow faster.

STYLES FOR EVERY AGE AND SIZE

IN making the stout figure appear slim, half the battle lies in the fit of undergarments. Corset cover No. 1303 has excellent lines for this purpose.

ON these sharp, frosty nights, the warmth of a snug pajama suit appeals to every youngster. No. 1255 is ideal for the small boy or girl.

No. 1255 cuts in sizes 2, 4, 6, 8, 10 and 12 years. The 8-year size requires 2½ yards of 36-inch material. Price 12c.

No. 1303 cuts in sizes 36, 38, 40, 42, 44, 46, 48 and 50 inches bust measure. The 36-inch size requires ¾ yard of 36-inch material. Price 12c.

OUR diagram dresses are a big success and No. 1778 will prove as popular as others we have shown. It is planned for house wear and runs up to large sizes.

No. 1778 comes in sizes 36, 40, 44, and 48 inches bust measure. Size 36 requires 3¾ yards of material 36 inches wide. Price 12c.

FOR the heavy figures, straight lines, panels and flare sleeves are advised. No. 1511 has all these points and is right in line with the newest fashions.

No. 1511 cuts in sizes 34, 36, 38, 40, 42, 44, 46, and 48 inch bust measure. Size 36 requires 3¼ yards of 40-inch material, with 1¾ yards of contrasting material and 2¼ yards of binding. Price 12c.

To order patterns, write your name and address, pattern numbers and sizes clearly, enclose stamps for the correct amount and address Fashion Department, American Agriculturist, 461 4th Avenue, New York City.

You will be crazy about our new Fall and Winter Fashion Magazine! That's a strong statement, but invest 10c and see if it isn't the best sewing help you've ever had. Not only pattern designs, but illustrated articles on stitches, trimmings and home dressmaking problems. Send 10c for your copy to-day.

Warmth

A PERFECTION Oil Heater is at home anywhere in the house: in the nursery these brisk mornings, for Father in the bathroom, for the unexpected guest, late arrived and chilled through—there are a hundred possible contingencies during the fall and winter months when a Perfection Oil Heater would prevent sickness, brighten hospitality, and keep the home warm and comfortable.

Reviewing the Latest Eastern Markets and Prices

THE APPLE EXPORT OUTLOOK

HERSCHEL H. JONES

EVERY apple shipper has been talking "export" this Fall in view of a British crop that is less than one-third as large as last year's and heavy exports are already under way. It is reported that about 200 carloads have left New York within a week.

There is no denying the attractiveness of the British apple market up to the present time. One recent shipment to Glasgow yielded the following gross selling prices per barrel: Kings, \$10.24 @11.38; Wealthy, \$7.74@8.87; Yorks, \$7.28@9.10; Baldwins, \$7.05@8.97.

As is well known the British trade likes a small apple. Commonly there is as good or better demand for 2 1/4 inch as for a larger size. A recent shipment of 2 1/4-inch Jonathans for example, brought \$12 per barrel. Of course, from these prices there must be deducted freight and commission charges amounting approximately to \$1.90 per barrel.

Just what the market will be for the remainder of the season is difficult to tell. Great Britain last year imported from the United States 500,000 barrels and 2,500,000 boxes. In addition to this, she received heavy imports from Canada. It seems probable that her imports this year will be much larger in view of the short crop. She cannot rely on Europe which itself is short this year. The British crop has been practically cleaned up already, for shippers are attempting to sell their stock before the heavy expected imports arrive. Neither Great Britain nor the continent have storage facilities for any large proportion of the crop. It appears therefore, that the field is clear for imported fruit.

In view of the heavy exports both in barreled and boxed apples already under way, dealers are anticipating a sharp drop in prices. It seems to be the feeling, however, that even a considerable drop would leave room for good prices to the shipper.

The prospective large exports make it more necessary this year than usual to put up a good pack. Freight rates are as high on cheap as on good apples. Apples for export should be sound and packed as tightly as possible in the barrel.

APPLE MARKET WEAKER

Receipts of barreled apples were heavier at New York last week and the market weaker on most varieties. Arrivals included principally Wealthy, Maiden Blush, Northwestern Greenings, Rhode Island Greenings, Fall Pippins, McIntosh and Kings.

Greening sold in a range of \$3@6 per barrel, with top price only for large clean "A" grade stock. "A" grade 2 1/2 inch and over ranged from \$3.50 @6. Large chain store buyers are reported to have bought heavily of Greenings "A" 2 1/2 and over, in Western New York at \$4.50 per barrel f.o.b. Northwestern Greenings 3 inch sold September 21 as low as \$1.25 per bushel basket, and are hurting market for Rhode Island Greenings.

McIntosh were more plentiful and dropped off a little in price with a rather weak market. The trade expects a better demand in the next two weeks, however. Fancy, large, well-colored stock brought as high as \$7.50 per barrel, but straight 2 1/2 inch "A" stock would not move freely at much above \$6.

Kings "A" 2 3/4 inch and over, sold at \$6 per barrel. No market established yet on Baldwins, but they are expected to be rolling this week.

The following quotations represent wholesale sales on other varieties September 20: Alexander and Wolf River \$4.50@5; fancy, \$5.25@5.50; few, \$6. Wealthy, \$5@5.50; fancy, \$6; few, \$6.25; ordinary, \$4.50. Duchess, \$4@4.50. Fall Pippin, \$5@6..

BUTTER MARKET FIRM

The market on butter remained firm during the week, prices advancing 1/2c per pound on fresh creamery extras which sold on September 20 at 46 3/4 @47c per pound. The larger buyers have been shifting from fresh to storage stock in the last few days.

In spite of the 8c duty on butter im-

ports from other countries continue. Several cars of fresh Canadian creamery butter brought under moderate sales 46@46 1/2c per pound. Other shipments consisted of 2,015 boxes unsalted from Argentine and 3,200 casks from Latvia, Siberia and Lithuania.

UP-STATE CHEESE FIRM

The higher grade of New York State flats met a very firm market under an active demand. The fancy stock ranged in price from 27@27 1/2c with some unusually high-grade stock bringing as high as 28c. The demand for average run State flats however, was very slight. On most other grades of cheese the market remained quiet.

KRAUT CABBAGE MARKET GOOD

With a short cabbage crop due to the extreme dry weather, there has been a fair demand for closely trimmed, kraut cabbage of good size, four pounds up. Shippers have been paying the growers \$18@20 per ton.

POTATO MARKET DULL

Early last week Long Island potatoes were in demand at loading points and the growers were getting \$1.40 bushel. Shippers were quoting 150-pound sacks at \$3.60@3.75 f.o.b.

Due to the Jewish holiday Thursday and heavy receipts the market declined

there were no sales because of the Jewish holiday.

EGG MARKET FLIGHTY

The egg market was in an unsatisfactory condition during the week due to an increasing accumulation of stock and a weak demand. On September 20 the market was unusually dull on account of the Jewish holiday. Already dealers are beginning to draw heavily on storage stocks in spite of fairly liberal arrivals of fresh eggs and this tends to make the market on fresh eggs particularly uncertain.

CASH GRAIN QUOTATIONS

Cash grain quotations September 21, were as follows:

NEW YORK: Wheat—No. 2 red, \$1.15 3/4. Corn—No. 2 yellow, \$1.04 1/4; No. 2 mixed, \$1.03 1/4; No. 2 white, \$1.04 1/4. Oats—No. 2 white 51c; No. 3 white, 48 1/2 @49c; ordinary white clipped, 50 @53c. Rye—77c. Barley—78 1/2 @79 1/2c.

CHICAGO: Wheat—No. 3 red, \$1.01 1/2. Corn—No. 2 white, 86 @86 3/4c; No. 2 yellow, 86 @87c. Oats—No. 2 white, 40 @43 3/4c. Rye—69 @69 1/2c. Barley—56 @68c.

LAMBS DECLINE

There was a general weakness of the lamb market during the entire week and prices declined somewhat from those of the previous week. On Thursday the only sales reported were for some southern \$13.50@14.50, while

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on September 21:

Eggs, Nearbys (cents per dozen)	New York	Buffalo	Phila.

and some shippers were paying the growers \$1.25 bushel and quoting carlots bulk at \$1.31 bushel loaded; sacks of 150 pounds \$3.60 f.o.b.

The trade in New York City was light. Many buyers were turning their attention to Maine potatoes which were offered freely at prices ranging from \$1.80@1.70 per cwt, delivered in bulk; sacks, 150-lbs. from \$3.10@2.80.

Many buyers were expecting lower prices for potatoes and were not inclined to make offers even at 10c under quotations.

Reports from several points up-State show at least 15% reduction in yield over last year's crop. The quality, however, is better. Growers have been offered \$1 per bushel.

HAY MARKET CONTINUES WEAK

The market on hay continued weak with considerable good hay moving out at lower prices than for some time. While hay was held on September 20 at \$28 per ton, there was practically none moving at above \$27. Canadian and Western hay is beginning to arrive in considerable quantities.

LIVE POULTRY MARKET WEAK

There was an oversupply of live express stock poultry on the market and prices declined under a very weak demand. On Thursday, September 20,

prime lambs held at the nominal quotation of \$14.75@15, and common to good \$10@14.50.

SPRAY CONTROLS CELERY BLIGHT

ALVAH H. PULVER

More than one celery grower in Western New York knows what it is to have a lot of trouble with blight. Experiments conducted in the town of Williamson show conclusively that increases of from 60 to 130 crates per acre in yield may be expected in ordinary seasons by controlling the blight through dusting or spraying. The experiments are grounded in five years of test and are therefore worthy of deep consideration. The average cost for the work runs up from \$12 to \$20 per acre, or a few cents per crate.

In the judgment of A. G. Newhall of this town, it is a mighty good plan to dust the plants in the seed bed once or twice at least. Commence when they are about an inch high, using a 20-80 or a 15-85 copper-lime dust. No poison is needed. It only takes a few minutes with a hand duster, and it will often prevent blight from being carried over from the seed bed to the field.

When the plants are about six or

eight inches high in the field, commence weekly applications of 20-80 dust or liquid Bordeaux. Use about twenty-five pounds of dust to the acre, the first two applications, and at least thirty-five pounds for the last three. One man should be able to take care of as much as four acres with a hand duster. Always dust when the dew is on the plants if possible. If blight gets a start, put on two applications at intervals of three days to check it. Keep the new growth covered. The time to dust or spray is, of course, before and not after a rain, because it is during wet weather that blights are spreading and the plants need protection. Summed up, the surest way of controlling the blight is to commence work in the seed bed. Do not let the blight get the start of you. Keep new growth covered. Do not leave the trimmings from blighted plants on the field in the fall.

WHERE NEW YORK GETS ITS APPLES

Just half the apples received in New York City last year came from New York State, one quarter from Washington and one quarter from all the remaining States put together according to the tabulations of the New York Office of the U. S. Department of Agriculture. Other States in the importance of their shipments to New York City were Oregon, Virginia, New Jersey, and California.

Figures for the last five years show that the proportion of shipments from New York State were larger last year than for any time in five years. Comparative figures for Washington show that she supplied 25 per cent of New York's receipts in 1922 and 30 per cent in 1921 and five years ago sent over 24 per cent of the supplies used in New York.

These figures indicate that so far as the New York City market is concerned there has been little change in the situation during the past five years.

Of course these figures vary according to the size of crops in each section. The slight change in a five year period may be attributed in no small part to an increasing effort on the part of New York Growers to improve their marketing and packing methods.

The center of the wholesale live poultry market is the West Washington Market below Fourteenth Street on Hudson River. Freight carlot shipments are sold and unloaded at the Thirty-third Street yards and various other terminals, the largest being at Jersey City. Express shipments are handled by a few firms downtown in the egg, butter and cheese section, and they usually realize good prices, possibly because not so directly in competition with freight receipts.

* * *

A new bulletin entitled, "Making Butter on the Farm," has just been issued. You can get it free by writing to the State College of Agriculture at Ithaca. Butter-making is rapidly becoming a lost art. There would be a bigger demand for home-made butter if more of it were of the high quality of that which our mothers and grandmothers used to make.

"Putting Up" Next Year's Seed Corn

Two of the Main Points Are To "Put Up" Enough and Keep It Dry.

By FRED. W. OHM

THIS is a pretty old subject. Just for the fun of the thing I sat down one afternoon and looked back through some old volumes of American Agriculturist to see how old the story of selecting seed corn is. I worked backward, so to speak, starting ten years ago. Then I jumped ten more. Then I jumped ten more. Thirty years ago the selection of seed corn was advocated. Yes, I went 'way back of that, sixty years, and more, and found information on the selection of seed corn. It is very interesting to read those old, old articles about farm practice.

In the September number of the American Agriculturist of 1844 is the following paragraph on selecting seed corn:

"This month seed corn should be selected. It can only be well done in the field. It ought to be taken from those stalks which have the greatest number of large, round, well-filled ears. In this way the Baden and the Dutton corn have attained all their well-earned celebrity."

In the issue of 1856 I found an article entitled, "Save Seed Corn Carefully." It reads as follows:

"In remarking upon the failure of the corn to come up last spring, we gave as a principal reason, that much of the corn was put up last fall in an imperfectly dried condition. This fact should be remembered now. Not only should extra care be taken to have all corn de-

signed for planting next spring thoroughly ripened and dried, but the best ears should be selected. Those ripening first are quite likely to produce the earliest ripening crop when planted.

"The largest ears should be taken, and these from the most prolific stalks. Those which are perfect, having the kernels well filled out at both ends, should in all cases be chosen.

"These matters are quite too often overlooked. We have known many farmers who have expended five to ten dollars or more per acre in preparing and planting a piece of ground, from which they have gathered scarcely half a crop, simply for want of a shilling's worth of time in selecting and preparing the best seed, and this, in a greater or less degree, is too much the case generally. It is like that other piece of bad economy practiced by multitudes, who send their children to the district school a year at an expense of thirty to fifty dollars for clothing, teachers, etc., and yet lose half the benefit to be derived, simply because they withhold one extra shilling for a suitable book.

"We urge every farmer to go over his cornfields himself, as soon as the crop is ripened, and gather out the kind of ears we have indicated, and then either husk and store them away in a dry room, or go back to the old-fashioned plan of stripping down the husks, braiding them together so that the seed ears may be hung up in the attic or other safe, dry place.—[Ed.]"

In the same issue there is a contribution from an Indiana farmer in which he tells of his method of selecting seed corn. He writes in part: "In referring to the poor corn seed planted last spring, the Agriculturist stated that it probably resulted from putting up the corn

too damp last fall. I think this must have been the difficulty. In gathering my corn as above described, I leave standing any thrifty stalks which contain two or more full-sized, plump, well-filled out ears. These remain in the field until perfectly ripe and dry, when the ears are plucked off and carried in baskets to a dry room over the granary, where they are left with the husks on until spring planting. Last spring my whole crop came up beautifully at the first planting, while many of my neighbors were under the necessity of planting the second time, and several of them came to me for what excess of seed I had to spare."

But to get back to "putting up seed corn." The subject has been so thoroughly broadcast through the farm press and through farmers' bulletins published by the Federal Government and our State colleges of agriculture, that there is nothing really new. We have been thoroughly drilled in such factors as size and shape of ear, position and height on the stalk, length of shank and true-ness to type and variety.

Of course, there are new varieties. Old varieties have been crossed and recrossed with a variety much superior to any of the originals. One particular example of this is the variety, Cornell 11, which was developed from Pride of the North and sev-

eral other varieties. It combines the qualities of both silage and grain varieties.

But there are some practices, however, although not new, that bear repeating. Our oldest and most capable corn-growers would call them "chestnuts." That very fact makes them worth repeating for there are other farmers who would profit by adopting the methods of those old veterans, assuming, of course, that they are growing a variety that is thoroughly acclimated.

Therefore, I am going to skip over those old "chestnuts" I have just mentioned and enumerate a few practices that I have noted are commonly used by the more expert corn-growers. The first, and outstanding, practice is that they always keep enough seed on hand, select enough, to maintain a two-years' supply. A few years ago, our early season was very bad on germinating corn. The weather was cold and wet. Those fellows who were "close to the wind" did not have enough seed to replant where germination had failed, had to go out and buy enough to replant. And usually they could not get their own variety. The old wisecracks had two years' supply and had nothing to worry about.

Another practice these fellows follow is to select their corn in the field, where they can take all factors into consideration. If seed corn is selected from the crib, it may be that the characteristics other than shape and size would be against it as seed. For instance, that ear, although it looks good in the crib, may have had a shank a foot long, which is a nuisance when a fellow is harvesting it. Furthermore, it may have been 'way up on the stalk. Corn

that bears its ears up in the air may come down in a heavy windstorm and stay down.

Then there is the matter of storing seed corn. The crib is not the place to store seed corn. It is subject to dampness, freezing and thawing—decidedly detrimental to the germinating qualities of each kernel. Dampness is vastly more injurious than cold. Perfectly dried seed corn will stand the lowest temperatures of our region without any serious effects. But let it get damp and then freeze, and the germ is almost sure to suffer.

George Fish of Nassau County, Long Island, is what his neighbors call a considerable corn-grower. His picture was on the cover of American Agriculturist of December 16, 1922. In that picture he was shown inspecting his seed corn, which he suspends in such a manner that no two ears came in contact with each other. They were stored in a dry place and there was a perfect circulation of air around each ear.

Several years ago I was in charge of an institutional farm and I was delegated by the director of the institution to locate a source of good seed corn on Long Island. I called upon a farmer who lives on the North Shore of the Island, who was well known as an expert corn-grower. He had his seed stored in the upstairs part of the carriage house, an excellent, dry place to store corn. He had ordinary chicken wire suspended from the rafters and his seed corn was stuck in this. The mesh was the regular poultry wire mesh and large enough to hold an ear nicely. He used alternating meshes so the ears did not come in contact. This man's corn was placed on my list of desirable sources.

I also visited a neighbor of his who had advertised that he had a quantity of corn for sale. I went there and asked his price. He went over to the crib, heaped a bushel full to overflowing, and named his price. He didn't get the business—at least for seed purposes.

OBSERVATIONS IN A WHEAT FIELD

J. N. GLOVER

Early last June one of my boy helpers helped me pull the cockle out of a 17-acre field of wheat. Fifteen acres of it were seeded with Pennsylvania No. 44 wheat and two acres with Lancaster-Fulcaster, which we had been growing for seven years with good yields. The No. 44 wheat I had bought two years ago, enough to seed two acres, furnished the seed for last fall's seeding. This wheat I noticed had more cockle in than I like, as I prefer none. On the 15 acres we pulled, 210 stalks of cockle in the No. 44 wheat, while on the two acres of my old seed wheat, we found only two cockle stalks. I think that a stalk of wheat would better be growing instead of a cockle stalk, so try to pull it every year to get rid of it entirely, if possible.

The fact that only two stalks of cockle were found on the two acres of my wheat which I had sown for seven years and 210 on the 15 acres of No. 44 wheat which seed I had bought, shows that I had been well rid of cockle until buying No. 44 wheat.

We found a few horse or narrow dock stalks which we pulled also and not one stalk of rye, cheat or garlic. The No. 44 wheat has a wide leaf this year, is taller and stiffer in the straw or stalk than my Lancaster-Fulcaster wheat and has a little larger head, though No. 44 did not yield any more bushels per acre last year than Lancaster did. A few more heads of smutted wheat were seen in the former than in the latter, but no rust. Some few stalks were down on account of the Hessian fly, but not many compared with reports I have heard of other fields.

While the stand of wheat on this field, as on many others, is not as good as most years, yet the heads are larger in size than usual, which may help to make a fair yield of grain in spite of a thinner stand of wheat stalks.

The place to select the ears is in the field, where all factors may be taken into consideration

POST YOUR FARM and Keep Trespassers Off

We have printed on linen lined board trespass notices that comply in all respects to the new law of New York State. We unreservedly advise land owners to post their farms. We have a large supply of these notices and will send a baker's dozen (thirteen) to any subscriber for 75 cents. Larger quantities at same rate. Address:

SEE YOUR HOME furnished with *DOUBLE DOLLARS* earned in spare time!

There's a corner in your home where this beautiful wicker desk set will be ideal. We'll send it to you for Auto Knitting only 15 dozen pairs of socks.

You will love the rich, mellow tone of this Console Phonograph. Let us send it to you for Auto Knitting only 36 dozen pairs of socks.

6 dozen pairs of socks will bring you this charming porch chair. Perhaps you would like to Auto Knit for the whole suite—three attractive pieces. Send at once for your free copy of the Home Makers' Reward Book and select the rewards for which you will Auto Knit.

SEE an attractive phonograph in the living room, a new reed rocker on the porch, a new chest of silverware in the dining room—the lovely, home-making things you have always wanted. All bought with double-value money—the new kind of money now paid to men and women who work at home in their spare time on the Auto Knitter.

Why Every Auto Knitter Dollar Is Now Worth Two

The Auto Knitter Hosiery Company has devised this unique plan for the purpose of giving its workers the greatest possible return for their spare time. By utilizing hours and half-hours during the day that otherwise might have been wasted, you can now earn in a double-quick way the things you have always wanted.

As an Auto Knitter worker, you will choose the hours that are most convenient, work when you like and precisely as much as you like. For every dozen pair of standard socks you make at home on your Auto Knitter we will pay you a standard price. The wage-rate now guaranteed Auto Knitter home workers is greater than ever before in the history of this organization.

And now, every Auto Knitter dollar you earn will be worth TWO. If you make \$60.00 a month in your spare time, as Mrs. Patsy Ferraro, of Pennsylvania, does, that \$60.00 will have a \$120.00 purchase value. If you earn \$500.00 on your Auto Knitter in six months, as has Mrs. Alice Bowen, of Utah, that \$500.00 will have a purchase value of \$1000.00.

The golden key opens the chest Use it for free information

Turn your spare hours into double dollars for the things you want. Find out at once about the big new plan.

See a handsome white enamel kitchen cabinet, earned by Auto Knitting only 17 dozen pairs of socks. See a splendid new sewing machine, earned by Auto Knitting only 11 dozen pairs of socks. See new comforts and luxuries added throughout your home—made possible by turning spare hours into dollars that do double duty in buying the things you want.

We will be glad to send you full details free. Just send the coupon—it will bring you all information in a day or two. We will include a copy of our big REWARD BOOK which illustrates the many attractive and useful things you can now earn right at home, the new double-quick way.

Don't put it off. Thousands will use this coupon to get the free information. We'll be watching for yours. No cost. No obligation. Just your name and address on the coupon. But send it off today, before you forget. **THE AUTO KNITTER HOSIERY CO., Dept. 879, 630-638 Genesee St., Buffalo, N. Y.**

<p>The Auto Knitter Hosiery Co., Dept. 879 630-638 Genesee Street, Buffalo, N. Y.</p> <p>I want to turn the key to the treasure chest. You may send me FREE full information regarding Auto Knitting and how it turns wasted hours into dollars. Also all details concerning the new plan that now makes every Auto Knitter dollar worth two. This does not obligate me in any way whatever.</p>

Milk In Its Relation To Public Health

Millions of Children and Adults Depend Upon this Great Food—A Radio Talk

EVERY year in the city of New York between 135,000 and 140,000 babies are born. To these babies, milk is just as essential as water or air. Unfortunately, the physical condition of some of the mothers of these babies is such that they are unable to nourish the infants themselves. A substitute therefore must be found. The nearest substitute that we have for mother's milk is cow's milk, as the composition of human milk is qualitatively similar to cow's milk.

Last year, 37,159 babies under two years of age were admitted to the baby health stations conducted by the Department of Health, city of New York. Of this number, 32 per cent were bottlefed or breast and bottlefed. This figure will give you an idea of the percentage of babies born each year that are dependent upon cow's milk in order to live. Between the first and second year a baby is almost entirely dependent on cow's milk for nourishment. This, with the 32 per cent of babies born each year that are dependent upon cow's milk plus the babies between one and two years of age who are also dependent upon cow's milk, you have approximately 200,000 babies in this city who require cow's milk in order that they may live and grow.

Cow's milk contains practically all of the food elements necessary for the maintenance of life. Proteins, fats, carbohydrates, vitamins and salts are present in the amounts best adapted for the young. Milk is also a satisfactory food for adults.

In New York City about three million quarts of milk are consumed daily; in other words approximately one pint of milk per person in the entire city. While this is a considerable amount, still the value of milk in the dietary is so great that it would be of material benefit to the people of the city if the figures showed that the per capita consumption was one quart per person.

Unfortunately, while milk is our most valuable food, it is also the food which may be most easily contaminated and deteriorates very rapidly. Milk is an excellent medium for the growth of bacteria, and because of the way it is handled, it is very easily contaminated with disease bearing bacteria. It has been definitely proven that the inception of epidemics of typhoid fever, diphtheria and septic sore throat have been conclusively traced to infected milk. Tuberculosis of bovine type is also transmissible to children under sixteen years of age. It is because of these conditions that the Department of Health places such stringent and rigid regulations governing the production and handling of milk.

Furthermore, it is because of these con-

By DR. FRANK G. MONAGHAN

*Commissioner, Department of Health,
City of New York*

ditions that pasteurization is required. Pasteurization of milk is merely the heating of milk to a certain temperature so as to destroy the disease bearing bacteria. The effect of proper pasteurization upon the nutritive quality of milk is so slight as to be almost negligible.

The milk which New York City consumes is produced on 40,000 farms located in seven different States. Unless strict supervision is maintained, it is possible for a case of typhoid fever on one farm to contaminate the milk

done, the bacteria present in milk will rapidly multiply and not only may the milk become dangerous, but will also deteriorate very rapidly.

A cow is milked twice a day, morning and night. The farmer can only deliver his milk in most instances to the creamery or shipping point once a day. This means that he must store the night's milk until the following morning when he delivers the milk of the previous night and the milk of that morning to the creamery or shipping point. In storing this milk, the farmer has to provide ice so that the milk will be kept at a proper temperature.

All of these conditions are factors which the farmer must give attention to and factors which affect the cost of producing a quart of milk.

In the East, the farmers cannot grow sufficient food for their cattle and they are therefore required to buy a considerable amount which is given to the cow.

Naturally if the cow is to be healthy and is to give a good flow of milk, she must be given substantial and well-balanced food. This is another item which adds to the cost of producing milk.

These are facts which it would be well for the city dweller to consider concerning milk.

Our slogan, therefore, should be a quart of milk for every person. If we were to actually do this we would not only improve our health but we would help to improve the agricultural conditions of our country.

There is no substitute for milk. Drink plenty of it if you desire good health.

* * *

In connection with the above address by Dr. Monaghan, it is interesting to compare the per capita consumption of dairy products in the United States with other countries.

For instance, the per capita consumption of whole milk per year in Denmark is approximately 274 quarts; in Sweden, 278.8 quarts; in Switzerland, 269.6 quarts; in Germany, 244 quarts; in Belgium, 176 quarts; in United States, 172 quarts. The yearly consumption of butter per capita in Australia is approximately 25 pounds; New Zealand, 21 pounds; Denmark, 19 pounds; in the United Kingdom, 17 pounds; in the United States, 15 pounds. The yearly per capita consumption of cheese in Switzerland is approximately 26 pounds; in the Netherlands, 13 pounds; in Denmark, 12 pounds; in the United Kingdom, 11 pounds; in Germany, 9 pounds; in France, 8 pounds; in Norway, 7 pounds; in the United States, about 4 pounds.

These figures show the tremendous possibilities both to the health of consumers and the finances of dairymen in using every means possible to increase the consumption of dairy products in this country.

There Is No Milk Substitute

THE article on this page by Dr. Frank J. Monaghan, Commissioner of the Department of Health of New York City, will do both consumers and dairymen an immense amount of good. It was broadcast from WEAf station on Wednesday evening, September 26, at 6:50 P. M., standard time. Many thousands of city people as well as country folks heard it over the radio.

Statements like these giving the plain facts about dairying and milk, coming from such an eminent authority as Dr. Monaghan, will encourage many thousands of people to increase their use of milk. Let us not forget also that the first place where milk should be used in large quantities is in the farm family.

By the way, if you have a radio, or if your neighbor has one, you are missing a treat if you are not tuning in Wednesday evenings, at 6:50 P. M., standard time, on station WEAf, to hear some of the best farm speakers to be obtained in America.—The Editors.

and thus spreading this disease to several hundred persons in the city.

In order to produce milk and cream which is safe for human consumption, the farmer has to give considerable care and attention to the actual handling of milk. It is here that the bond between the farmers and consumers first becomes apparent. The people in the city are dependent upon the dairy farmer for their milk supply, and to a certain percentage of our population is essential to life. The dairy farmer on the other hand is dependent upon the people in the city for a market to sell his milk. In order to produce a milk which is wholesome and clean the farmer must first obtain his milk from cows that are healthy, and to be certain that his cows are in good condition, the farmer has to call in a veterinarian each year to have these cows physically examined.

The farmer must provide a cow barn or stable which is properly lighted, properly ventilated and of sufficient size to provide sufficient air space for the cows which are housed therein. The milking must be done under extremely cleanly conditions; only pails and cans which have been sterilized must be used for holding milk, and after milking, it must be promptly cooled to a temperature of 50 degrees F. Unless this is

For the Dairymen

DAIRYING is the largest and probably the most important branch of farming. Not only is this true, but dairy husbandry is the basis for much other good farming, especially in the East. Where there are cattle, there is fertilizer and there are comparatively few farms in eastern United States that do not need manure in order to produce good crops.

Because milk production is so important, and because next week at Syracuse there will be the greatest gathering of dairy interests in the history of the industry, we have taken particular pains to emphasize in this issue this great branch of farming.

In doing this, we want to make it clear that we are not urging more men to take up dairying, nor are we urging those already in the business to increase their production. What needs to be emphasized not only in dairying but in every branch of farming is the placing of our different branches of agriculture on a better business basis. This means first, cutting the costs of production by increasing the quality of the animals and of the crops which we raise; and second, marketing our products to better advantage than we have in the past.

Because these points are both well emphasized at the Dairy Show, at Syracuse, we hope you will be able to attend. But even if you cannot go, we think that the gathering of dairymen and dairy scientists from every State in the Union and from many of the other countries of the world will be of direct benefit to you and to all of our eastern dairymen by the stimulus and encouragement it will give toward getting this important branch of agriculture on a better paying basis.

Now Sell It Well—

IN the next few months farmers will market all of their products that they have worked so hard during the past season to raise. On the attention that they give to marketing those products properly will depend to a large extent how much real money they get

for them. We have often said that we could never see any use in giving so much time and hard work to growing stuff and then paying so little attention to selling it. A lot depends upon the way the fruit or vegetable is packed. Culls and second quality stuff might better be thrown away than crowded into a package with the first quality product. Attractive packages, attractively packed with the same good product from top to bottom will pay for the extra care taken.

No matter what you have for sale it will pay to very carefully study the market situation. There are market reports now in every newspaper, and American Agriculturist pays special attention in the paper and by broadcasting reports by radio every day, so as to give you the market trend of prices, so that you can judge for yourself when is the time to best sell your stuff. We will be glad to answer any particular questions that you may have at any time.

What Does It Cost You To Do Business?

WE have just received some very interesting figures collected by the United States Department of Agriculture, showing the average costs of producing farm crops. These figures are discouraging to the average farmer, but they are distinctly encouraging to the man who does a little better than the average.

The investigations show that in 1922 it cost 66 cents a bushel to produce corn; \$1.23 to produce wheat; and 53 cents to produce oats. The cost figures include charges for labor of the operator and his family and for the use of the land. It cost \$23.01 per acre to grow corn. The average yield was 35 bushels per acre, making the cost per bushel 66 cents. The average value of the corn sold was 73 cents per bushel. It cost \$19.68 per acre to grow wheat and the average yield was 16 bushels per acre. The cost of growing oats was \$17.40 per acre.

A similar investigation on every crop grown in America would show that the average farmer's costs are either very close to the selling price or even above his selling price. There are two reasons for this: first, the yield and quality of the product per acre on the average farm are too small, which causes the costs of production to be too high, and second, the average product is not well sold. If a man cannot grow more than 16 bushels per acre of wheat, which is about the average yield in the United States, he certainly had better quit, for he will never make even a decent living. And the same statement applies to all the other average producers. The hopeful thing about it is that a little more intelligently directed effort and a little more attention paid to business details such as getting better seed, weeding out poor cows and poor hens, and keeping accounts, will very quickly and very easily raise the returns above the average; and as soon as the individual farmer gets out of the average class, he will begin to make a profit.

Let's Talk Up

IN a way it is an admirable virtue to be modest, but sometimes it is poor policy from a business standpoint, and the farmer is in business. The western farmer has always been more willing to talk about his business than we who live in the East. We have heard a lot, for instance, of the California fruit cooperatives and their great success. The chief reason why we have heard so much about them is that the Californians have not been afraid to talk up.

We do not have to go very far West either to notice this western habit of advertising itself. The other day a prominent farmer of the central West was speaking at a farm-

er's meeting in New York State. He let it be known that he did not think much progress had been made in cooperation in New York and New England, and left the thought that we should take example from western farmers. Then he went on to tell about the fruit growers' organization in a central western State which had recently graded and packed a brand of apples and successfully put them on the market. The joke was that this farmer evidently did not know that those same fruit growers before establishing their brand of apples came up to western New York to leaders of the Western New York Apple Packing Cooperative Association and learned from them how to do the job!

American Agriculturist asks every farmer and farmer's organization in New England and the Middle Atlantic States, to cooperate with us in our leading policy of bringing the farm business and the farm products of the East to the attention of the whole country and especially to the attention of our eastern markets. In this policy there should be no fight with our brothers of the West. We admire their advertising enterprise and seek to do likewise.

The Dairy Feed Situation

THE increased prices of dairy feed are giving farmers much concern. Owing to the dry season and short pastures, dairymen began to feed heavily early in the season. Milk prices have been fairly good and this, as usual, caused many farmers to crowd milk production by heavier feeding. Then, too, farmers this year have been encouraged to buy their winter feed requirements early. All of these factors have greatly increased the demand for feed beyond the immediately available supply and high prices have resulted.

Fundamentally, the situation is abnormal because there is a large production of whole grains on the western farms. All that is needed is for the farmers to ease off on their buying for a time and thereby help the feed manufacturers to catch up their supply to the heavy demand.

Eastman's Chestnuts

IN a recent issue we told the story of how Mr. Morgenthau, our publisher, on a visit to the farm of H. E. Babcock, found a very lonesome Holstein cow among Ed's fine herd of Guernseys. It will be remembered that when Mr. Morgenthau, who himself has a large registered herd of Holsteins, demanded why the Holstein cow was in such company, Ed, standing first on one foot and then on the other as is his habit when embarrassed, finally confessed that he had to keep the Holstein in order to have the milk to grow his Guernsey calves!

Well, I thought that that settled once and for all the great eternal debate between the Holstein and Guernsey men about the merit of their respective breeds, but it seems it did not. A few days ago I got a letter from Lewis A. Toan. Lew is another of those Guernsey enthusiasts. He is so enthusiastic in fact that his fellow breeders have elected him president of the State Association.

In this letter, Lew said: "Your story in last week's Agriculturist was somewhat garbled. When Mr. Morgenthau found that Holstein cow and kidded Ed Babcock about it, Ed, after twisting about a bit, replied, 'I'll tell you the truth, Mr. Morgenthau. My spring has gone dry and my well has gone dry, so I didn't have a darn thing to wash my milk cans with!'"

"Upon the farmers of this country in large measure rests the fate of the war and of the nations."—WOODROW WILSON, April 15, 1917.

Dairy Show Will Help Your Pocketbook

Emphasis Must Be Placed on Expenses, Not Income

THE National Dairy Exposition, to be held in Syracuse, October 5 to 13 inclusive, is owned and operated by the dairy industry—not for profit—but to demonstrate how we can work together to increase dairy farm earnings by reducing farm management and labor costs. Increased production and income on the farm do not necessarily mean increased profits. Profits are determined by your production costs just as in any other business.

Heretofore, most of us have been accustomed to estimate the success of a farmer's business by size of income rather than by actual profits earned. As Dr. George F. Warren, Agricultural Economist, New York State College of Agriculture so ably says: "For a generation profits in agriculture have been based more on the income side. *The primary problem was to increase receipts. Now the emphasis must be placed on expenses.*" Economies of production rather than size of income is the important problem farmers must solve to-day if they hope to hold their own in the world's commercial activities.

It is not enough that you secure the most milk from your cows, but that you accomplish this at the least expenditure of money and labor. The economic solution of your dairy farm problem does not mean "more cows to produce more milk," but depends upon greater production per cow, least cost in feed to produce most results, better breeding, reduction of labor costs and all other items of overhead.

The National Dairy Association which directs the Exposition has been established for eighteen years. It is made of groups of men identified with the dairy industry in all its branches. The Exposition at Syracuse will be the seventeenth annual show. These shows have conclusively proven to thousands and thousands of dairy farmers that the means to better dairying, better milk products, better dairy management and greater farm prosperity can be successfully exhibited at an annual Dairy Exposition. These yearly exhibits gather together and demonstrate the best standards which have guided and directed dairy farmers to increased earnings from their business.

At Syracuse this year, October 5 to 13 inclusive, the best pure-bred dairy cattle in the world and the highest producing grade cows will be on exhibition. This will afford an opportunity to study types of dairy cattle, to compare noted individuals of all five leading breeds and to see what breeding and feeding will do for your pocketbook without adding labor or cost to you. "Seeing is believing." Any open-eyed, wide-awake dairy farmer who looks at these dairy cattle showings, who observes closely and asks questions will obtain practical information which he can profitably apply to his business. These dairy cattle showings demonstrate clearly that scientific feeding and breeding will produce profitable results

By W. E. SKINNER

General Manager, National Dairy Show

for any one. At the Exposition, you are not merely told what certain methods should produce, you are shown the actual results.

The displays of machinery and equipment for the farm, barn and dairy are additional educational features of the Exposition which likewise point the way to more efficient and

economical dairy farm management. Here you can see and examine all the best appliances produced by leading manufacturers and learn exactly how you can lessen your labor and operating costs through the use of these appliances.

In this present day of intense commercial activity, high-labor costs and close-marginal profits in all lines of business, it has become more increasingly necessary that one know his costs, manage his business with the maximum of efficiency and thorough understanding of all its phases.

In this connection, you will be especially impressed by the remarkable United States Department of Agriculture's \$25,000 Panoramic Exhibit—"Dairying Past and Present." Just to see it will be an education in itself. It will depict the history of the dairy industry, portraying the various stages of development through which the dairy industry has passed to reach its present stage of perfection.

The entire Exposition affords an opportunity to witness the most stupendous visualization of everything pertaining to the dairy industry. Never before has there been brought to you so comprehensive an array of all the phases of the industry relating to greater earnings on the dairy farm. In fact, the National Dairy Exposition is now recognized as establishing standards in the dairy industry of the entire United States.

Let me emphasize again the economic aspect of the Exposition. Every farmer who attends will carry ideas back home which can be put to practical use without a drain on the pocketbook. The sole purpose of the Exposition is better dairying, better milk products, better dairy management, increased consumption of dairy products and increased prosperity for the dairy farmer through the utilization of efficient tools and implements to give him greater profits for money and labor invested.

Program of the Dairy Show

THIS program gives a general idea of events during the period of the National Dairy Exposition, October 5 to 13, inclusive. It is subject to minor changes without notice, but in the main it carries accurate information as to date and place of important events.

FRIDAY, OCTOBER 5

Formal opening of the Exposition, with World's Dairy Congress delegates from 36 foreign states participating, 2 p. m.

World's Dairy Congress sessions during forenoon.

Students' National Contest in Judging Dairy Cattle, Coliseum, 8 a. m.

Display of prize winning butter and cheese in the Dairy Building, and announcement of winners.

Dedication of new Coliseum, erected by the State of New York at a cost of \$500,000, by Governor A. E. Smith, 8 p. m.

Public reception by Governor Smith for foreign delegates following dedication exercises in Coliseum, 9 p. m.

Cattle parade, all dairy breeds.

Exhibits, demonstrations and lectures on health, nutrition and human welfare—a wonderland of new and novel life—(Continued on page 228)

High Lights of the National Dairy Exposition

UNITED STATES Department of Agriculture's \$25,000 Panoramic Exhibit—"Dairying Past and Present"—the greatest exhibit of its kind ever produced.

* * * * *

New York State's \$10,000 exhibit and those of Wisconsin, Iowa, Ohio, Vermont and others, all showing important phases of agricultural and dairy industry development.

* * * * *

Sessions of the World's Dairy Congress in the mornings from October 5 to 10 inclusive. (Except Sunday the 7.)

* * * * *

Conventions, meetings and discussions every day of all the leading dairy and breeders' associations in the United States.

* * * * *

Official opening of the Exposition, with World's Dairy Congress delegates from thirty-six foreign countries participating.

* * * * *

Formal dedication of the new \$500,000 Coliseum with Governor Smith officiating and public reception for foreign delegates and the public.

* * * * *

Evening entertainment—Utility Horse Show, demonstrating the kind of horses required for government, State and industry use and for pleasure. Interspersed with industry pageantry and fine musical program.

* * * * *

Boys' and girls' contests, exhibits and demonstrations—instructive work for and by the "future farmers."

* * * * *

Agricultural college students' cattle judging contests.

* * * * *

Vocational training school for boys. A three days' program affording an unusual educational opportunity for the younger generation of farmers.

* * * * *

Human welfare and domestic science displays, demonstrations and health talks. Child welfare especially emphasized.

* * * * *

Comprehensive display of the National Dairy Council and its activities with relation to increased consumption of dairy products and the dietary value of milk and milk products.

* * * * *

World's best dairy cattle (over 1,200) pure bred, competing for the show ring's highest honors.

* * * * *

Exhibit of grade cows with high producing records, showing the kind farmers can own for profit.

* * * * *

Cattle associations' exhibits, full of information and suggestions for better dairy cattle on American farms.

* * * * *

Gigantic display of machinery, equipment and supplies for dairy farm and dairy factory—five large buildings full of beautiful exhibits from leading manufacturers in the country.

* * * * *

Exhibits of motor trucks and trains illustrating the unusual and highly modern methods of transporting milk and dairy products.

* * * * *

Great display of dairy products from all dairy States, showing the world's best production.

* * * * *

The most complete and comprehensive visualization of the Dairy Industry—including all its branches and embracing all its activities. The greatest educational opportunity ever gathered and arranged for the general good and profit for everyone engaged in the industry.

THE UNEXPECTED HAPPENED

in the dairy barn at Mara Alva Farm, Smithville, O., when they ran short of a very good quality alfalfa hay. The substitution of a poor mixed hay was necessary—there was nothing else in sight for some time. Mara Alva's herdsman naturally looked for a sudden sharp slump in milk production.

But right here he thought of his grain mixture and of how it might be improved to offset the change to inferior roughage. He decided to give DIAMOND CORN GLUTEN MEAL a trial. So he added a liberal amount of DIAMOND to his ration, still expecting, of course, to see production fall off, minus the stimulus of the alfalfa.

But production *didn't*. It went along on its usual levels for a few days and *shortly it began to increase*.

The DIAMOND in the grain ration was more than making up the difference between good and poor roughage.

Do you wonder it's in

To Plow or Not To Plow

The Pros and Cons of Turning Land in the Fall

THERE is a strong By DAVID STONE KELSEY warm, unless another series of arguments crop is immediately

in favor of fall plowing, thus getting a hard, slow, power-consuming job out of the way of April's rush—and it is really about the only way to properly prepare for next spring's potatoes, and oats; but there are at least an equal number of sound reasons against fall plowing, as usually practiced here in the eastern States, or a lot of "don'ts" at least, as my boys call them in giving out work to the men.

And lest some good neighbor rushes out to hitch up before reading this story to the end, I shall begin by a list of some of my pet "don'ts." Then, if he still goes to plowing, he can at least give a reason for his act.

We do not plow, where possible to avoid it, for any fall-sown grains or grass seeding even—unless it can be done early enough to permit ample time for settling of the soil again. Rather, we keep harrowing instead, more-and-more shallow, like summer fallow methods, for all grains, grasses and clovers need a solid seed-bed.

We never plow merely to "turn over." After any hoed crop, that three inches of the soil immediately at the surface we believe is the richer. Why should we turn up exhausted soil and turn down the best? It would give a poor start, besides subverting Nature.

And plowing is not necessarily inverting. A slice of turf, turned smoothly up-side-down is *not* plowed (for us) for by that process we mean to include crushing and mixing and loosening even more than merely inverting. We always chop turf land (diagonally—never "with" the coming furrows) by using the weighted cutaway two or three hours per acre first, thus starting the process of remaking it into plant-food. But never use a mere disc-harrow for this work—nor go, even a few feet, in the direction you are to plow, we "Dutch harrow" always, that is, go both diagonal ways. Then, by turning about three-quarters over, with a good jointer to tuck the edge down, we have done something besides invert. That field of chopped up turf will decay very rapidly in the warm, moist condition of fall.

And that brings up another "don't!" When the soil is not too cold, and loose enough and dry enough to be pervious to the air, soluble plant-food elements are constantly being liberated. Under the added stimulation of plowing, which further aerates and hurries both bacterial life and chemical reactions, grave losses may result by leaching through the winter following. Better wait till November. It is a great waste of soil nitrates to plow while the land is still

seeded in to take up the fast-forming, soluble elements. This is why we try to have something growing on the land about every hour of the unfrozen year.

And finally, we don't plow without turning under something. The very stimulus of tillage burns out our precious humus, of which no eastern upland ever has enough, and only the plowing under of turf stubble, coarse manure, straw, clovers or other green manures can deepen our humus and make Nature's two inches of forest or wild soil, ten or more inches deep.

Briefly then, we plow far less than is done on many farms yet where "there's a reason," never hesitate to plow for spring or other purposes—after November first. It is an excellent time to thus get the jump on the spring rush—to clean out burrowing insects and perennial pests like quack, by exposing them to all the fury of winter winds and weather.

We like bare, unharrowed furrows too for the hard job of winter lime-spreading, and we always resort to the fall plow for the subjugation of bogs, briers and brush. But we do not plow in *early* fall, other than for immediate reseeded. We believe that, in any good husbandry, bare, brown fields are anathema—the mark of an agrarian crime.

CONVENIENT METHOD OF LAYING TILE

Ray L. Walker, a Lorain, County, Ohio, farmer, has worked out a home-made chute for unloading tile which H. L. Rogers, his county agent, says is the simplest and most successful device he has ever seen.

It is, in effect, a tile-sized trough sloped down from the back of a wagon, so that a load of tile can be slid down it, one by one and end to end, and laid out on the land along the line of the proposed ditch as the wagon is driven slowly forward.

The trough is simply a two-by-six, eight feet long, with two inch boards nailed to the edges to hold the tile on the track as it slides down. The top end of the chute is attached by a half-inch rope to the tail of the wagon, so that it slopes about 30 degrees. The lower ends is carried on small wheels.

An inch board three inches wide and three feet long is nailed across the bottom of the chute where it touches the wagon, this to prevent overturning on rough ground. To prevent breakage, and to insure even distribution of tile, the chute should always be kept full.

Champion American Milk Producer East of the Rocky Mountains

Kolerain Marion Finderne has recently finished making a record of 35,339 pounds milk containing 1,278.5 pounds 80 per cent butter. Her milk record is the largest ever made east of the Rocky Mountains and the third largest in the world. She milked over 100 pounds a day for 178 different days, her best day's production being 116.7 pounds which was produced when she had been on test 42 days. There was only one day in an entire year that she milked less than 70 pounds. She was bred by E. F. Copeland of Colerain, Mass. but has been owned since she was 3 years old by Loeb Farms of Charlevoix, Mich. Her sire is Finderne Pride Payne. She is the second daughter of this sire to milk over 32,000 pounds in a year.

Trail Blazers

ALL over the Great West is written the record of the pioneers who blazed the first trails that guided civilization in its westward march.

As settlers followed, Montgomery Ward and George R. Thorne blazed a new trail to them, being first to fill their wants direct by mail and in the complete spirit of the Golden Rule.

Trail Blazers—Business Pioneers we were, and are. Fifty-one years have but given us experience. We stand today more alert, forward looking, searching out new methods in manufacture and trade to secure for you better goods and bigger values and greater savings.

Trail Blazers of over fifty years ago, Montgomery Ward & Co. still clings to this spirit of leadership—we are the Oldest Mail Order House and Today the Most Progressive.

Fall & Winter 1923-24 Catalogue No. 99
MONTGOMERY WARD & CO.

All over America

This Book is Now Saving Millions of Dollars for the American People

The opportunity is now yours to Save Money on nearly everything you buy—for the Farm, the Home and the Family.

You have a copy of this book—or a neighbor has one. Because into every state, into every city, into every county all over America the Montgomery Ward & Co. Catalogue has gone, bringing its opportunity for money saving this Fall.

Montgomery Ward & Co. Is Working Constantly to Keep Prices Down

Over Forty Million dollars' worth of merchandise has been bought and manufactured especially for this Catalogue, bought when prices were the lowest—articles of steel were manufactured when steel prices were down, leather goods when hide prices were low.

Our buyers have actually searched the important markets of the world in their determination to secure these bargains for you—to help hold prices down, to make your savings larger.

Are You Using This Book?

Are you taking full advantage of your money-saving opportunity? Is your family buying from this book?

You can save many dollars this season *if you use this Catalogue*, if you buy from it regularly, if you study this book and see for yourself the saving it brings to you.

Ward Quality—And low prices

Never, in over fifty years, have we intentionally sacrificed quality to make a low price. We offer no price-baits on unserviceable merchandise.

It is our policy to sell only goods of Ward Quality—the kind of goods that stand inspection *and use*. So a low price at Montgomery Ward & Co. is always a low price on reliable goods of standard quality.

We believe it takes both standard quality *and low price* to make a bargain. And every bargain we offer is a reliable, serviceable article that will give you entire satisfaction.

Begin today saving money by using this book. Begin today sending all your orders to Ward's—where your patronage is always appreciated, where for over fifty years every customer has always been given a square deal.

The EMPIRE is so simply constructed a boy can clean it.

No Trick at All to Clean It

A few minutes each day and a thorough going over once a week keeps the Empire Milker spick and span. Plenty of hot water makes the weekly cleaning a quick job, too. (Boiling doesn't affect the rubber parts.)

Thousands testify to the easy operation and care of this wonderful labor saver. Robert M. Bighmy of MacFarland, Wis., writes—"Aside from the cleaning, the only other attention we give it is to put a very small amount of the special grease on the leathers of the pulser about once in four or five months, which takes about one-half hour."

See the Empire dealer—learn more about the milker that is easy to clean—the machine that cuts labor costs to a third of hand milking, gets better milk from your cows and more of it, and brings you bigger dairy profits. Get the facts and you'll then understand why the Empire is standard equipment in so many of the leading dairies.

EMPIRE MILKING MACHINE CO.

A Year's Dairy Lessons

Some Things I Would and Would Not Do Again

WE are supposed to live and learn. By H. E. BABCOCK

Sometimes, as far as the latter is concerned, it is necessary "to set up a strike" to note our progress. However, one cannot buy the feed for and superintend the care of 150 dairy cows for a year without drawing some conclusions. These I am going to set down in a sort of summary form; doing this will help to clarify my own thinking and perhaps pass on something of benefit to American Agriculturist readers.

If we have learned anything during the past year it is to appreciate good roughage more than ever. Alfalfa, clover, and early cut timothy are absolutely necessary to the cheap production of milk.

In previous articles I have told how, after we had a cow or group of cows at the highest point, we could force them with a grain feed we could raise or lower their production immediately by varying the quality of the roughage fed.

In our A. R. testing we have depended more on good roughage and regular care than we have on grain.

Our grandfathers used to cure hay in the cock. With the introduction of machinery and the increased cost of labor we have been becoming more and more careless in our haymaking.

Last summer Dr. McCollum of Johns Hopkins University told me—and I believe Professor Savage agrees—that hay which is well cured away from direct sunlight so it retains its green color and which does not mow-burn, contains valuable elements which ordinarily cured hay loses.

During the past year we have tested this out a bit and for some reason or other than having less breeding troubles with our cows than ever before.

For years we have wanted to grow alfalfa and more clover. No one of us but has had the disheartening experience of securing a fine stand of alfalfa or clover and then having it winter-kill. The most valuable contribution to agriculture made during my time, I believe, has been the discovery by the New York State College of Agriculture through practical field tests of the necessity of using northern grown alfalfa and clover seed in practically all sections of the State in order to secure crops of these legumes that will live through our severe winters.

With this discovery, and with the subsequent introduction of this seed on a commercial scale, has come a great improvement in the hay crop of the State as far as the needs of dairy cattle are concerned.

In our own experience in buying and feeding grain the past year has taught us some valuable lessons. Formerly, like many dairymen, we depended upon the protein analysis to measure the value of a grain ration. To-day we are buying our grain with little regard for the protein content, provided it is somewhere between 16 and 20 per cent, but with the utmost care to know the digestible nutrients the ration contains.

Any ration containing less than 1,400 pounds of digestible nutrients has no

place on a dairy farm; yet thousands of tons of such rations are sold that will not carry much over 1,250 pounds of digestible nutrients per ton.

Both in our regular dairy and in our A. R. testing we have ample proof of the fact that a ration with not over 16 per cent protein, but which is at least four-fifths digestible, will make more milk and keep our cows in better condition than many rations analyzing higher in protein.

I wish I could get the message to every man who buys dairy feeds—and had the time to support it with our records—that buying protein without regard for digestible nutrients is causing dairymen to lose millions of dollars each year.

I do not want to go on record as saying that the silo has been overemphasized. There is a place for one on every dairy farm. I am convinced, however, that silage as a food for dairy cattle has its distinct limitations, and I am not sure but what the teaching of recent years, that we should put as much digestible dry matter in the silo as possible, has been somewhat misleading.

Of one thing I am sure. That is, if we have plenty of good alfalfa and clover hay, or very early cut timothy and wild grass and a highly digestible grain ration, the chief value of silage lies in its succulence. In fact, with our A. R. cows, we soon found that there was a limit beyond which we could not go in feeding silage without impairing production.

This limit, as I recall it, was about a peck of silage per cow per day, a surprisingly small amount compared with the standard of feeding on the ordinary dairy farm.

Within the next few months we will finish a dozen A. R. records on pure-bred Guernseys. We have learned that it costs real money to make A. R. records on pure-bred cattle. It remains to be seen whether or not it will pay us. Personally I am of the opinion that there is a good deal of bunk in the proposition. Some man makes a high advanced registry record on an unusually fine animal and sells her for a fancy price. From then on his experience is pointed to as an example for young men to follow.

Nothing is ever said of the hundreds of mediocre records that are made, of the high record cows which lack individuality, and of the hundreds of cows which have their usefulness ruined by forcing or poor feeding during the test period.

Size, individuality, health—these, I believe, are even more important than records. A large cow that is healthy and possesses the individuality cannot help but give milk if she is well cared for. There is room and a good market at fair prices for thousands of such animals. Perhaps it would be well, as we look into the future, to plan on raising more of them and to think less of the occasional individual we hope to own some day that will break the world's record.

FROM A KODAK NEGATIVE MADE ON THE FARM

Autographic Kodak

GOOD pictures, easily made, and complete even to date and title written on the film at the time by means of the exclusively Eastman autographic feature—that's the Kodak way.

You'll want such pictures of live stock, crops, equipment, buildings, for reference and year-to-year comparison; you'll point to them proudly in your Kodak album when they are made just for fun, like the illustration above.

Autographic Kodaks \$6.50 up

Eastman Kodak Company, Rochester, N. Y.

One of the features of National Dairy Show Week, will be a dedication of the new dairy building at the New York State College of Agriculture at Ithaca. The picture shows the building as it now appears—a structure in keeping with New York's greatest farm industry. The dedication exercises will take place on Saturday, October 13 and will be attended by leading dairymen from all parts of the United States as well as foreign countries, who will be in attendance at the show in Syracuse

350 to 400 pounds of Milk from every 100 lbs. BULL BRAND

—is so commonly the experience of Bull Brand users everywhere that we guarantee these results! And in addition, we guarantee more milk from each cow.

Only the choicest ingredients and the most careful milling can make a feed with these exceptional milk producing qualities!

Remember, it isn't the price of 100 pounds of feed that counts—it's the cost of making 100 pounds of milk!

And even though Bull Brand should cost a great deal more than it does—the results obtained will justify our claim that Bull Brand Dairy Ration is the most economical feed on the market today.

OUR GUARANTEE
Feed three or more cows on BULL BRAND DAIRY RATION in accordance with our directions. If the results do not prove satisfactory to you, upon application to us or any of our dealers the money paid for the feed used will be refunded.

There's a live BULL BRAND Dealer in every live town!

BULL BRAND DAIRY RATION
3-4 LBS. MILK from 1 LB. FEED!

So Easy to Use

—In Poultry Houses, Cow Barns, Etc.—

Carbola is a white paint and powerful disinfectant combined in powder form. Simply stir the powder in a pail of water and it is ready for brush or sprayer—no waiting or straining. *Does not clog sprayer. Won't peel or flake.*

The powerful disinfectant does not evaporate but keeps its strength on the walls. Carbola will not spoil even in water and may be kept standing in pail to be used as wanted. One pound covers about 100 square feet.

Results Are Sure and Certain

Carbola is neither poisonous nor caustic—harmless to the smallest chick or stock that licks a painted surface. It gives walls and ceilings a smooth, white finish, increases the light, improves the appearance, and helps make buildings clean, sweet-smelling and free from mites and contagious disease germs. There is nothing better than Carbola for dairies, poultry houses, cellars, dog kennels, rabbit hutches, garages, tree trunks, etc.

It has been used for years by more than 100,000 dairy and poultry farmers and by agricultural colleges and experiment stations. We have a big file of letters from farmers and storekeepers praising it. Give it a trial—you will never regret it.

AS A LOUSE POWDER for use on cattle, poultry, horses, hogs, dogs, etc., the dry powder will be found most satisfactory. The dry powder is applied like any other louse powder, and is very effective—a first-class louse powder at 10c a pound.

Your hardware, feed, seed, poultry supply or drug dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express.

How To Sell Your Poultry

Avoid Market Gluts to Get the Best Price

HOW, when and where to market the poultry surplus, and in what condition to market it, are questions that call for answer with the arrival of fall.

Most poultry is sold from the farm "on the hoof." The individual farmer does not wish to take the time for home dressing. He is unfamiliar with the best methods of finishing, dressing, packing, and shipping. He lacks the equipment for chilling and holding and he does not have the market outlets to dispose of the dressed product to the best advantage. Similar reasons were responsible for the shift from farm slaughter of cattle and hogs to the big packing houses and caused creameries to replace farm butter-making.

Much poultry is shipped alive to the large consuming centers, but whether dressed in the smaller towns near the point of production or in the large cities, a goodly fraction of it is put through an intensive fleshing or finishing process before slaughter. Spring chickens are fed about ten or fifteen

the fall and early winter, since the percentage of heavy, well-finished birds in the receipts increases after the first of the year.

Country buyers may try to buy all poultry at a flat price instead of paying a premium for that which is fat. In such cases, producers can ship direct to reliable commission houses on the large markets, if the distance is not too great, where their poultry will sell more nearly on its merits. Regular shipping crates, which can be obtained through the commission house, should be used.

During the cold weather, the farmer can dress his birds and ship them without fear of spoiling. Dressed poultry costs less to ship than live, and if properly dressed and chilled, the shrinkage will be small. The farmer who undertakes to dress his own poultry will be competing with the professional dressers, however, and must approach the standards of packing set by them.

No food is given for a day before slaughter, the birds are stuck so that

Seasonal Fluctuations in Prices of Dressed Poultry

days and hens five or ten days in crates arranged in batteries in the poultry packing houses. They are given all they will eat two or three times a day of a ration such as 60 per cent of finely ground corn meal and 40 per cent red dog flour or white middlings mixed with enough buttermilk to make it like mortar.

Young chickens will add 20 to 60 per cent to their original weight by feeding in this way and 350 to 400 pounds of dry feed with the buttermilk used to moisten it, will produce 100 pounds of gain. Compared with the cost of making gains on other kinds of live stock, together with the selling price, poultry fleshing has distinct advantages.

Best Poultry is Milk-Fed

Besides the additional weight, the carcass is made more plump and attractive in appearance and is bleached by the milk feeding. All these benefits are preserved by slaughtering as soon as the finishing process is completed. Poultry which is milk-fed and fattened to capacity on the farm will shrink and be very easily bruised and blemished when shipped alive, so that it will not grade as first class when dressed and most of the results of special feeding are lost.

This does not mean that no effort should be made to finish poultry to be sold from the farm. Handlers of poultry constantly complain that only a small percentage comes to market as well-finished as it might properly be made by the producer. For this very reason, the poultry fleshing industry has furnished a golden opportunity to the packers.

Prices for live poultry in the large cities discriminate between the unfinished and the well-fleshed. To some extent, this is shown by weight. Heavy hens, for example, are selling for four to seven cents more than light hens weighing under four pounds. This discrimination is most pronounced during

they bleed thoroughly, and they are plucked dry instead of scalded. The heads are wrapped in paper to avoid smearing other parts of the carcasses with blood. The birds are cooled for a day or so in a room slightly above freezing and then sorted into uniform sizes and grades and packed in boxes of a dozen birds, or in barrels. The barrels may be packed with ice, or, if the weather is cold, the birds may be shipped by express in boxes without ice.

Markets differ to some extent, but dressed broilers are usually sorted into those weighing under 20 pounds to a dozen, those weighing 20 to 24 pounds, and 25 to 30 pounds; fryers, 31 to 35 pounds; and roasters, 36 to 42 pounds, 43 to 47 pounds, and 48 pounds, up. Fowls, which are hens and pullets beyond the springer stage, are sorted into similar groups from 30 pounds down to 66 pounds up. Those in barrels or kegs are not sorted so closely. Milk-feds, at the present time, bring one to three cents a pound more than corn-feds on the New York market.

Opportunities in Private Trade

Poultry producers located reasonably close to the larger towns and cities found in every State have an opportunity to develop a special trade with hotels or well-to-do consumers, who are willing to pay attractive prices for high-class, milk-fed poultry dressed on the farm. For such trade, it may be advisable to draw and truss the birds before they are delivered.

All these methods of marketing call for extra time and labor which the farmer may find it inconvenient to furnish when field work is pressing. Co-operative marketing, when it reaches the stage of operating poultry fleshing and packing plants, which are not costly, offers a better way for the producer to get the full worth of his product.

Poultry marketed early in a season

New Lamp Invention Beats Electricity

Beautiful Lamp Gives 400 Candle Power For Less Than 1/2 Cent A Night

Any home may now have the benefits of electric lights at practically no cost through the remarkable invention of B. J. Davis, a Kansas City expert mechanic.

This amazing invention called the Economy Lamp is beautifully designed and an ornament to any home. There is no wick, chimney or odor. It lights instantly and gives more light than 20 electric light bulbs, 27 lamps or 400 candles at a cost of less than 1/2 cent a night. It is so simple a child can operate it with perfect safety and carry it anywhere.

So proud is Mr. Davis of his invention that he wants to send an Economy Lamp free to try, to any reader of American Agriculturist who will write for it. If you want plenty of soft, brilliant, healthful light you should accept this generous offer without obligation by simply sending your name and address to B. J. Davis, 109 Economy Bldg., Kansas City, Mo., before this special introductory offer is withdrawn.

Keep the Radiator Clean

ED. HENRY

WITH the approach of cold weather, if the radiator on the car or farm truck is to be safeguarded from freezing, it will have to be filled with an anti-freezing solution. Before doing this, however, it is always advisable to first thoroughly clean it out if the greatest efficiency of the cooling system is to be maintained. A system clogged with dirt or rust will not allow of free circulation, nor can a scale-incrusted system be expected to cool efficiently.

To remove dirt or rust, unless it has accumulated sufficiently to produce clogging, a thorough flushing will suffice. However, a system that has been cleaned as often as it should will not have clogged from these two causes. With scale incrustations in hard water regions it is different, there is always some trouble from this source.

Unless the radiator is so badly incrustated as to require mechanical treatment or boiling in a vat, the following will clean it effectually and with a minimum of labor. *It is caustic, however, and care must be used in handling it.* Dissolve about one-half pound of lye in five gallons of water. Strain this solution and put it in the radiator. Then run the engine for five minutes and afterward draw off the solution.

Now thoroughly flush out the cooling system in order to remove every trace of lye. This can be accomplished by filling the radiator with clean water several times and then running the engine five minutes after each filling and before drawing the water off again.

BRAKE LINING ON LIGHT TRUCK

My Ford truck needs some new brake linings. What kind do you advise me to get?—R. B., New York.

It is pretty hard to answer an inquiry of this kind, because we do not like to recommend one kind of brake lining in preference to another when there are several very good ones. However, there are hard and soft brake linings. The particular kind to use will depend on the care you give your truck. If you use it pretty hard, or if some careless person is going to handle it, then the hard linings will give better results in the severe wear to which it is subjected and will be less likely to burn out.

If you handle your truck yourself and use it very carefully, you can use the softer linings which will give better results in braking; that is, it will start and stop the car smoothly and easily. Some repair men are using an extra tough and rather hard lining for the brake band, but putting softer and lighter linings in the slow speed and reverse bands, which are not used so much. Then they will all wear down more evenly.

WATCH YOUR BATTERY TERMINALS

Very often corroded battery terminals cause a great deal of trouble. The lights, horn and generator might be operating smoothly, but the self-starter will not work. The reason for this probably is that the terminals of the battery are either corroded or poorly fitted, so that only a sufficient amount of current to operate the lights and horn can pass.

The electrolyte, or battery acid, is the cause of terminal corrosion. If it has once begun, the best way to eliminate it is to clean the terminals until there is a bright lead finish, then wash them with ammonia, or some other alkaline solution to neutralize what acid may be present. Of course, care should be taken that none of this solution gets into the battery. After the cleaning is accomplished, see that the terminals make a good full contact. Tighten them up well, and coat them with vaseline or other grease to prevent the acid from coming in contact with the joints.

Usually about the only attention a battery requires is to keep the plates covered with the electrolyte, adding distilled water as needed. On long tours, when there is continual driving the steady charging may cause some overheating, but this can be obviated by keeping the lights burning part of the time.

for Economical Transportation

Quality Cars Now Easy to Own

5-Passenger Sedan NOW \$795 F. O. B. Flint, Mich.

It is no longer necessary to pay high prices for quality transportation.

Through engineering and marketing efficiency, Chevrolet has achieved volume production of quality automobiles, thereby effecting such remarkable economies that it now leads all standard-built cars in volume of sales.

Artistic appearance, fine finish, and riding comfort are characteristics of all models.

Ease, simplicity, and economy of operation are insured by a chassis famous for its engineering efficiency.

You have reason to be proud of your Chevrolet. It is an achievement.

G. L. F. Emergency Dairy

RESOLUTION

WHEREAS - The value and popularity of the public formula feeds heretofore originated by the Cooperative G.L.F. Exchange, Inc. have been so great as to stimulate extensive imitation on the part of competitors, and,

WHEREAS - The production of imitations has produced an extraordinary demand for the ingredients specified in said open formulae with the result of stimulating the market prices of such ingredients to unreasonable heights, and,

WHEREAS - It seems the part of sound economic policy to refuse to be a party to any action that will further increase prices of dairy feeds either now or in the immediate future, be it

RESOLVED that the Cooperative G.L.F. Exchange, Inc. suggests to its shareholders who have given orders for G.L.F. feeds for delivery during the six months from October 1923 to March 1924 inclusive, that they meet the situation by substituting for Milk Maker and Exchange Dairy a G.L.F. Emergency ration as made up under the direction of Professor E. S. Savage of Cornell University and the price of which is hereby definitely set as \$45.05 per ton Syracuse rate basis, and be it further

RESOLVED that for those who feel that it is imperative that they have feeds mixed according to the established Milk Maker or Exchange Dairy formulae such feeds be priced for the month of October at \$51.41 for Milk Maker and \$48.41 for Exchange Dairy Syracuse rate basis.

Linseed Meal, 34%	180#
Molasses	260#
Steamed Bone Meal	20#
Calcium Carbonate	20#
Salt	20#
	2000#

Bulky—Palatable—Digestible

1465 lbs. Digestible Nutrients.
Cost per ton: \$45.05, Syracuse Rate Basis.
Cost 100 lbs. Digestible Nutrients: \$3.07.
Contains No Wheat Feeds.
Use Gluten Meal Instead of Gluten Feed.
Guaranteed 20% Protein—9% Fibre—4% Fat.
Actual Protein Considerably Higher.

Substitute G. L. F. Emergency Dairy and Wait for Market Declines

You are urged to substitute G.L.F. Emergency Dairy for your Milk Maker and Exchange Dairy pooled orders so that you may later buy the established rations at a reasonable price. The formula has been prepared by Professor E. S. Savage with your best interests in mind. The price of \$45.05 Syracuse rate basis for October, November and December shipment, with 50 cents per ton per month carrying charges added for January, February and March, protects you at a reasonable price throughout the season.

Protect Your Milk Check

G. L. F. Emergency Dairy is Distinctly a Fighting Ration

In conference with manufacturers of some of the necessary ingredients, it has been repeatedly stated that dairymen are able to pay the increased cost of these ingredients because they are receiving a better price for their milk.

Our answer to this is that you should not be compelled to do so and that we are not serving your interests if we permit such injustice when previous years have brought small milk returns, and especially so when other basic ingredients are available at reasonable prices.

Why Feed Prices Advanced

At no time since the Pool opened have prices on the chief ingredients been at a level which would permit purchases that would establish a fair relative price as compared to last year's bookings.

Short selling of wheat feeds has been prevalent. Many feed manufacturers came out with flat season prices which would not permit replacement, but anticipated seasonal declines which did not occur. Early buying was urged and considerably stimulated. On top of this came a very dry season and poor pasturage, which further increased the demand.

Cash corn, because of scarcity, became very high. Gluten manufacturers reported light production and flour mills which sold and anticipated production on the basis of sixty-five to seventy-five percent of capacity worked at only about thirty-three percent during August, and are still operating on the lightest seasonal production known for years.

Basic supplies are plentiful and cheap. Current quotations of September 20, 1923 as compared with September 20, 1922 reveal Northwestern bran prices \$10.00 higher, local bran \$9.50 higher, and Chicago September wheat almost six cents lower. Still, in many places in this State, farmers are receiving less than \$33.00 per ton for milling wheat and paying close to \$40.00 for bran.

Gluten feed is approximately \$17.00 higher today and \$3.00 higher than the highest price of the 1922-1923 feeding season, while corn, its basic commodity, is less than \$7.50 per ton higher. Hominy is about \$8.00 higher or more closely in line with the highest cash corn values. Cottonseed meal is about \$8.25 higher and oil meal out of Northwestern mills about \$14.00 higher.

With crops of wheat, corn, oats, barley, cotton and flax generally better than the ten year average and many of the crops far in excess of last year's production, it would scarcely seem justice to you or the carrying out of your trust, to in any way contribute to further artificial stimulation by attempting to cover your requirements on the Milk Maker and Exchange Dairy formulae,

even were the supplies of ingredients available at the existing levels.

Substitute G. L. F. Emergency Dairy

The price on G. L. F. Emergency Dairy is reasonable for season shipment. It is but \$1.75 a ton higher than the low summer price on Exchange Dairy. All who ordered on the feed pool are protected by the price on this ration against higher markets. If prices work lower they will be immediately reflected in the cost of Milk Maker and Exchange Dairy. The thing to do is to use the Emergency Dairy Ration. When lower prices come you can go back to Milk Maker and Exchange Dairy if you so desire.

Professor Savage's Endorsement

IN offering EMERGENCY DAIRY as a substitute for the tried and well known Milk Maker and Exchange Dairy, the G. L. F. is to be commended. The substitution will make it advantageous to wait until the markets adjust themselves on the ingredients which go into the original rations. EMERGENCY DAIRY is highly digestible, uses only the finest quality high-protein ingredients and over-runs its guaranteed analysis sufficient to make it a real substitute for Milk Maker as well as Exchange Dairy. It will give very satisfactory results.

I hope that those who have ordered in the Feed Pool will co-operate with the G. L. F. in its fight for reasonable prices on public formula dairy rations.

Sure-Fire, All-weather Ignition

Silo filling time. Better snap up the ignition of your gas engine with a New Columbia Hot Shot. That's the right ignition. The largest laboratory, devoted to perfecting dry cell batteries, makes it right. Hence, Columbias give more power and last longer. Simple, no complicated parts to get out of order. Super-durable, moisture-proof, rain-proof, in their steel case, they insure dependable ignition in all weather. Ask for Columbias; insist on getting them.

Columbia Dry Batteries

—they last longer

Columbia Dry Batteries for every kind of service are sold at electrical, hardware, and auto accessory shops, garages, general stores. Insist upon Columbia.

My Engine Does the Work of 6

Read the Amazing Facts About This Wonderful Farm Engine

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."

—A. Y. Edwards

The regular power jobs on your farm probably vary from about 1½ to 6 H. P. Yet there's no need to have two or more engines for these jobs. Today you can get six engines in one. You can get an engine that will deliver 1½ H. P. for the little jobs, 6 H. P. for the heavy work, or any desired power in between. You can change power as you change jobs—change power instantly. And you will get high efficiency and low cost at all powers.

No Other Engine Like It

There is no other farm engine like the Edwards. It pumps, washes, churns, separates, milks, runs an 8-inch grinder, 30-inch wood-

saw sheller, small silo filler, concrete mixer, spray rig, etc., and does every job easily and cheaply. No other engine can do this. It is easy to move and can be set anywhere and put to work without fastening down. Burns kerosene or gasoline. Smooth running. No vibration. Safe—no cranking. Safety fly-wheel and all moving parts enclosed. Anyone can operate it.

What Users Say

Fred Dunderi, Strathcona, Minn., says: "I certainly like my Edwards Engine. Runs an 8-inch burr mill full capacity. Has plenty of power and then some. I like its varying speed and power and its light weight. It is so easy to move from job to job. Best and handiest engine I have ever seen or used and wouldn't part with mine at any price. I couldn't get another one and I wouldn't go back to the old-fashioned heavy type engine to use as a gift. The Edwards does all the company claims for it."

"One of my neighbors was looking over my Ed-

wards and I ran it for him and changed it all the way from 1 to 6 H. P. He will buy one right away. He is using a 4 H. P. at present but at times needs 6 H. P. so this would be the very engine he wants."

A. C. Lukehart, Dayton, Pa., says: "Well pleased with my Edwards and would not trade it for any other kind of engine that I know of as it is so handy to move from one job to another and the company has been fair and square to deal with."

Free Trial Offer

Now—I know I am making some extraordinary claims for my engine. I want to prove them to your satisfaction. I want you to try the Edwards Engine absolutely free. Don't send me a penny. Don't send me an order. Just write your name and address on the coupon below and I'll send you complete information about the Edwards, together with my straightforward, unconditional free trial offer. You will not be obligated in any way.

New York Farm News

Oneida Co.—The hay crop, which was good as to quantity and quality, was secured in good condition mostly. Oats harvest quite well. Some threshing done. Recent showers have started after feed. Some good pieces of corn, but mostly below standard. Potatoes have been looking good. Frost did considerable damage in northern part of the county. Fresh eggs sell at 38c, new potatoes \$1.50 to \$2 per bushel. The flow of milk is shrinking.—E. N. A.

Along the Southern Tier

Tioga Co.—The 64th annual fair of the Tioga County Agricultural Society held on the first week in September was the best one ever held in this county. The attendance was the largest on record and the exhibits were of higher order in all departments. The seven Granges of the county each had an elaborate booth. The pageant which was given during the evenings, depicting the agricultural history of the county was a great success. Over 500 people took part. During the first week in September the extremely dry weather was relieved by an excellent rain. The drought which has been quite severe this season has greatly retarded crops. The milk supply has been about cut in half. Some corn fields have been completely ruined. Others look fairly good. Buckwheat is filling fairly well. The oat crop was heavy. Some potatoes were greatly benefited by recent rains. Motorists passing through say that apparently Tioga County showed less effect of drought than most counties they passed through, and we thought we were all dried up.—C. A. B.

Broome Co.—Considerable rain fell during the first week in September. Springs immediately began to show the effects of it. On the night of September 10, the weather was very close to freezing. School began in most districts on September 4. There seems to be more teachers available than for many years. Many farmers are cutting wood or planning to do so in the near future. Buckwheat is being harvested.—MRS. L. K. C.

In Western New York

Erie Co.—Farmers are threshing and getting ready for winter in general. Wheat did not turn out very good. Potatoes and corn are doing well. Hay was also good, now selling for \$14 a ton. The help proposition is getting quite serious. Our boys and girls are going to the city where they can get higher wages. Butter is 51 cents a pound, eggs 40 cents a dozen.—MRS. A. C.

Wayne Co.—While the acreage of beans in Wayne County this year is considerably larger than that of last year, the dry weather has injured the crop to such an extent that the total yield of beans will be less than that of last year. We had a very long dry spell and many fields which were planted rather early began to yellow up and mature before the showers came in the latter part of August and early September. It is very doubtful if the yield of beans will be on the average of 15 to 18 bushels in contrast to yields of 20 to 25 bushels normally.—E. R. W.

Ontario Co.—We have had quite a dry spell, occasional showers, things look fairly well. Cabbage is quite small, looks like a short crop. Potatoes are not turning out very well. If we only would get some rain it would help the wheat ground. Pastures are very thin.—H. D. S.

New Grape Insect in Seneca

A new grape bug has appeared in Seneca County, having been discovered in the Smith vineyards.

In appearance the bug somewhat resembles the beetle. Its work is given to the leaves, causing them to wither and dry up. The experts at the Geneva Station failed to classify the bug with any previously reported, and an immediate special study was ordered on the insect. While it is reported that the vineyard men discovered the insect in time this year so that by the aid of the present sprays little damage was done, it is believed that the bugs would have worked much damage in time. As soon as all the facts are rounded up on the matter the station will report the new-comer.—A. H. P.

Fatter pigs & fatter profits

HOGS need animal food to build flesh and bone. Dold-Quality Digester Tankage is 60% animal protein. Mix with grain or feed separately in hoppers or slops. Gives better results than grain alone; saves one-third cost. Tankage-fed hogs show more pounds when marketed—and more profit per pound. Experience proves it.

Jersey Farm Bureaus Start Campaign

ONE of the most important moves of organized farmers in New Jersey starts this month when the New Jersey Federation of County Boards of Agriculture, which is the New Jersey unit of the American Farm Bureau Federation, launches its membership drive to renew its support for the next three years. Over 8,000 farmers now organized through their county boards of agriculture into the State Federation are solidly back of the movement.

Under the slogan of "Forward, Farm Bureau!" the Membership Committee of the State Federation will go into every agricultural county in New Jersey to sign up fruit growers, dairymen, vegetable growers, poultrymen and general farmers for the support of their County Boards of Agriculture, the State Federation and the National organization, which jointly represent 1,250,000 farmers in 40 States.

George Rixon of Haddonfield, N. J., prominent in farm bureau organization in this State three years ago, has accepted the appointment as State Campaign Leader. Each County Board of Agriculture will appoint a county campaign manager, who is a farmer and resident of the section, to work with the State Committee. These campaign managers will take full charge of the membership drive in their respective counties.

The membership drive will follow through all the counties until by mid-December all farmers of the State have had an opportunity to renew their pledge to support farm bureau movement. The campaign centers through the State Headquarters of the New Jersey Federation of County Boards of Agriculture, at Trenton, N. J., of which A. Cooley is Secretary.—W. H. B.

MIDDLESEX COUNTY COOPERATIVE HOLD ANNUAL EXHIBIT

Down in Middlesex County, N. J., a gray building standing at a corner in the road might puzzle the passerby. It looks like a church—and yet it doesn't.

The answer is simple—It was once a church, now it isn't. The Farmers' Cooperative Association, in search of a building, bought it, moved it seven miles to the chosen site, refinished the interior, put in lights, chairs and a stage, a piano and other "fixin's" and behold! The building which once sheltered a congregation is now headquarters for the activities of three lively communities.

There are a hundred members or so and no deadwood. In fact, according to F. W. Stillman, secretary of the association and one of the moving spirits since its start five years ago, every member is a live one, and not only was practically all the work on the remodeled building done by members, but the financing was too. What small amount of money in notes there is outstanding—and the organization had paid off practically all its obligations, as well as kept up its running expenses—is held by the members themselves, although local banks have voluntarily offered financial aid.

The annual three-day exhibit—a county fair in miniature, with the "amusement" features excluded and the agricultural displays the feature—was the occasion for the first visit of the American Agriculturist representative to the headquarters of this thriving cooperative association. And the exhibits were well worth a railroad trip to see.

This Middlesex County Cooperative is one which other communities might well study. It has gone ahead without dramatic "spurts," but on a steady, sensible basis. Nothing which could not reasonably be accomplished was undertaken, but once a definite goal was set, every member got behind with a will. The result has been its healthy condition of sound financing and continual steady progress. Various farm necessities—100 tons of lime at one time, carloads of supplies at others—have been purchased by the association for the benefit of all the members.

"We have been taking the American Agriculturist for many years and we like it very much."—Thos. T. Horton, De Kalb Jct., N. Y.

The Carbohydrate Feed Especially Suitable to the Requirements of The Eastern Dairymen

The scarcity of home grown grains in the East makes it necessary for dairymen to select with care a carbohydrate feed that will best supply their cows with the maintenance part of the ration.

You'll make no mistake in feeding

SUGARED SCHUMACHER FEED

because it is made up of the world's greatest carbohydrate grains, Corn, Oats, Barley and Wheat, finely ground, correctly balanced and sweetened with cane molasses, making it exceptionally palatable. This combination of nutritious grains supplies your cows with energy and endurance, enabling them to give maximum yields over long periods.

Feed Sugared Schumacher Feed as the maintenance part of your ration, along with our "Boss" 24% protein feed or any other good protein concentrate and you will be agreeably surprised at the marked increase in milk yield and better health conditions of your herd.

Send your name and address for our new FREE dairy book, "The Dairy Herd"

NOTICE—If you attend the Dairy Show be sure to visit our exhibit in Farm Machinery Exhibit Building No. 2. Meet our Feed Experts—they have some interesting feeding facts for you that will make your call profitable.

Congressional Mention of the Postal Life Insurance Company

Senators Smoot, Norris and Overman were discussing War Risk Insurance on the floor of the United States Senate, and the best way to reach the boys who had allowed their policies to lapse, so as to arrange for their reinstatement.

From the Congressional Record of Jan. 6th, 1920, the following extract is taken:

Senator Overman: "Could not that be done by circularizing the soldiers?"

Senator Norris: "I think that would help a great deal."

Senator Overman: "I was once insured in a company, which I think is one of the most successful companies in the world—and the reason the Senator's bill commends itself to me so strongly is because of the plan proposed for collecting the premiums—which can and does write insurance because they have no agents. They do it all by printed matter. It is a very strong company and is conducting a great business in this country. It is known as the Postal Life Insurance Company."

Mr. Overman matured a policy in the POSTAL and the Company earned his good will. It is good will and good words that have built it up and that are the great dependable sources of future business.

With resources of more than \$10,000,000; with \$43,000,000 of insurance in force; with net low cost to policyholders and with its HEALTH BUREAU benefits, the POSTAL is indeed the Company of

Safety, Saving and Service

The HEALTH BUREAU issues periodical bulletins on health-conservation and disease-prevention and policyholders have the privilege of one free medical examination each year, thus making it possible to detect incipient disease in time to check or cure it.

Lastly, the cost of insurance is low because POSTAL policyholders receive the benefit of the commissions that other companies pay their agents.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912.

Of American Agriculturist published weekly at 416 W. 13th St., New York, N. Y., for October 1, 1923.

State of New York, County of New York, ss. Before me, a notary public in and for the State and county aforesaid, personally appeared Henry Morgenthau, Jr., who, having been duly sworn according to law, deposes and says that he is the president of American Agriculturist, Inc., and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and address of the publisher, editor, managing editor and business managers are:

Publisher, Henry Morgenthau, Jr., Hopewell Junction, N. Y.; Editor, E. R. Eastman, 557 Van Cortlandt Avenue, Yonkers, N. Y.; Managing Editor, E. R. Eastman, 557 Van Cortlandt Avenue, Yonkers, N. Y.; Business Manager, Henry Morgenthau, Jr., Hopewell Junction, N. Y.

2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and address of stockholders owning or holding 1 per cent or more of the total amount of stock.) American Agriculturist, Inc., New York, N. Y.; Henry Morgenthau, Jr., Hopewell Junction, N. Y.; E. R. Eastman, 557 Van Cortlandt Avenue, Yonkers, N. Y.; Elmer F. Morgenthau, Hopewell Junction, N. Y.; Henry Morgenthau, 31 West 72nd St., New York, N. Y.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear on the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is..... (This information is required from daily publications only.)

Henry Morgenthau, Jr.

President.

Sworn to and subscribed before me this 21st day of September, 1923.

(Seal) Philip Ganz, N. Y. County No. 27, N. Y. Register 5048.

(My commission expires March 30, 1923.)

TB Program Adopted

IN order to find and agree upon some program most acceptable to the farmers of the State for getting rid of bovine tuberculosis, the New York State Farm Bureau Federation at its last annual meeting appointed a committee to cooperate with the Department of Farms and Markets and the Farm Bureaus of the State. This committee consisted of E. R. Zimmer, Secretary of the New York Holstein Association; L. A. Toan, President of the New York State Guernsey Breeders' Association; M. E. Buckley, of the Lincoln School of Agriculture; Jay Coryell, State Director of New York Farm Bureaus; and H. E. Babcock of Ithaca, N. Y. Following the untimely death of Mr. Zimmer, M. C. Bond, who succeeded him as secretary of the State Holstein Association, was appointed in his place. The committee organized by choosing H. E. Babcock as chairman and Jay Coryell as secretary.

This committee held many all-day meetings and made an exhaustive study of the whole situation. As a result of the information which it obtained, the committee made its report to the Farm Bureau Federation, which accepted it, and then brought it before the New York Conference Board of Farm Organizations. This body, after making two or three amendments, accepted the report and recommended it as a future program upon which all forces in the State should unite to eradicate TB. The committee's report, as it was finally adopted by the farm organizations, is given on this page. It is worthy of careful study by every dairyman, because it will vitally affect the interests of every man who keeps cows.—THE EDITORS.

The fundamental reason for eradicating tuberculosis lies in the menace of the disease to the health of the general public, particularly to the health of young children. The committee also believes that it will be of economic advantage to farmers to eradicate tuberculosis from their herds, thus reducing the losses from death and lowered production which its ravages undoubtedly cause. Since both will benefit thereby in the long run the committee feels that both the general public and the cattle owner should share in the expense of eradication.

Ignorance, the committee believes, is the chief limiting factor in eradicating bovine tuberculosis. Cattle owners who do not understand the nature of bovine tuberculosis cannot successfully combat it. The committee, therefore, earnestly recommends that the State Department of Farms and Markets and the New York State College of Agriculture combine on an educational program to help farmers to understand and combat the disease successfully.

Inability to secure clean replacements for cattle eliminated from herds as the results of tuberculin tests, the committee believes, also handicaps the eradication of the disease. It therefore recommends that County Accredited Herd Associations, in cooperation with the State and Federal officials, administering eradication work, draft requirements for a system of dealers in clean cattle; that they receive and pass on applications from men who desire to meet these requirements; that they give publicity to a list of such dealers; and that indemnities be paid on the animals which react either in the dealers' hands or after addition to herds to which they are sold.

Indemnities as now established by State and Federal legislation and regulations, the committee feels, are not too high to give reasonable indemnification to the owners of the better grade of dairy cattle; in many instances, they are not high enough. The whole matter of indemnifications can be regulated by appraisals. The committee recommends that indemnities be left at their present figures.

The committee found considerable confusion arising from the present joint administration of the Accredited Herd plan by both State and Federal officials, and in at least one instance there was a direct conflict in ruling. It recommends, therefore, that the administration of the Accredited Herd plan in New York State and of all bovine tuberculosis eradication work in which the Federal Government shares, be centered by agreement in the person of the New York State Commissioner of Farms and Markets and by him, if desirable, delegated to such other New York State official as he may designate and for whom he accepts full and complete responsibility.

The committee also recommends that cattle owners desiring to cooperate with the State and Federal authorities in eradicating tuberculosis, group themselves into County Accredited Herd Associations; that they make as a requirement to membership in these associations the signing of the Accredited Herd agreement; and that they

select where feasible as officers and directors, owners of accredited herds.

The local administration of tuberculosis eradication, whether under the Accredited Herd agreement or not, the committee believes, should be a matter of joint agreement between the directors of County Accredited Herd Associations and a single official representing both the State and Federal governments.

The question of whether or not cattle owners pay for their tests or receive the same free engaged the committee's attention for some time. These conclusions were finally reached: That there should be no free initial tests given by State or Federal veterinarians as such; that the function of the State and Federal veterinarians is to supervise eradication work; that whether or not the testing within a county should be paid for by cattle owners or by supervisor's appropriation should be determined by local public sentiment and the ability of the County Accredited Herd Associations to secure the necessary appropriation. All members of the committee question the permanency of any system of free testing and believe that cattle

owners who pay for their test will give more attention to the necessary steps beyond testing, which are required to eradicate tuberculosis.

The committee favors the development of clean township or county areas as the ideal toward which tuberculosis eradication work should be directed. It will be possible to police such areas and keep them clean. Procedure in realizing the ideal of the clean area should be always a matter of joint agreement between County Accredited Herd officials and the officer representing the State and Federal Governments.

Funds appropriated for tuberculosis eradication work, the committee believes, should be allocated to counties on the basis of cattle enumeration to be spent under the joint direction of County Accredited Herd Associations and the single official representing the State and Federal Government. Because, many counties will not use up their allocation on account of lack of interest in the work or freedom from the disease, the committee believes funds should be reallocated periodically.

The committee recommends that the chairman of the Agricultural Conference Board call a conference of the presidents of County Accredited Associations to be held in connection with the National Dairy Show to form a State body to represent the various county associations.

**"Men!—Let Me Tell You About This
New Improved Power Saw"**

HERE, folks, is my new model OTTAWA Log Saw—my greatest achievement in over 20 years of building machines to make farm work easier! It's a labor-saver that every man with wood to cut needs right now! It's a money-maker. It does the work of 10 good hired men. Best of all, this new model OTTAWA is easy to own! I sell it direct from my factory at a Low Factory Price. I give you dollar for dollar value—and a 10-Year Guarantee to bind the bargain.

HERE'S WHAT IT DOES— This new model OTTAWA falls trees, saws logs, buzzes up branches, does belt work. You can use it every day in the year. You can use the OTTAWA to run your feed grinder, corn sheller, pump, washing machine, etc. It will save you lots of hard work, time and money, and will quickly pay for itself.

350 CUTS A MINUTE— that's how fast the 4 Horse-Power Motor puts the saw through the wood. Saws the human way, like two men with cross-cuts, only much faster and with greater force. Plenty of power—and you need it! Uses kerosene or gasoline. Easy to start—Easy to operate. Wheel mounted—easy to move. Friction Clutch enables you to start or stop saw while engine runs.

OTTAWA "4 in 1" LOG SAW

1—Falls Trees. 2—Saws Logs. 3—Buzzes Up Branches. 4—Does Belt Work.

Try 30 Days— Know for yourself, by actually using the OTTAWA, that it will do all and more than I claim. Try a whole month at your own work. You can pay cash or I'll arrange Easy terms to suit. And remember, every OTTAWA is backed by my 10-Year Guarantee. Quick shipment from factory and 9 branch houses.

Make Money! With coal way up in price again this year and wood in demand for fuel, there are big opportunities for making money with an OTTAWA. Saw 15 cords a day. Just think, wood selling for only \$3.00 a cord would bring owner \$45.00! Write me today for full details on this proposition and get started making money.

FREE BOOK

I can't begin to tell you all about my new OTTAWA and what it will do for you, in this small space. So send me a postcard with your name and address for my new "Wood Sawing Encyclopedia", Big Special Offer and my Low Factory Prices. Right now's the time! Send today!

There's Big Money in Your Wood Crop! Harvest it With an Ottawa Log Saw.

The Broad Highway—By Jeffery Farnol

CHAPTER IV

I MEET WITH A GREAT MISFORTUNE

THAT day I passed through several villages, stopping only to eat and drink; thus evening was falling as, having left fair Sevenoaks behind, I came to the brow of a certain hill, a long and very steep descent called the River Hill. And here rising stark against the evening sky, was a gibbet, and standing beneath it a man, a short, square man in a somewhat shabby coat of a bottle-green, and with a wide-brimmed beaver hat sloped down over his eyes, who stood with his feet well apart, sucking the knob of a stick he carried, while he stared up at that which dangled by a stout chain from the cross beam of the gibbet—something black and shrivelled and horrible that had once been human.

As I came up, the man drew the stick from his mouth and touched the brim of his hat with it in salutation.

"An object lesson, sir," said he, and nodded towards the loathsome mass above.

"A very hideous one!" said I, pausing, "and I think a very useless one."

"He was as fine a fellow as ever thrust toe into stirrup," the man went on, pointing upward with his stick, "though you'd never think so to look at him now!"

"You knew him perhaps?" said I.

"Knew him," repeated the man, staring at me over his shoulder, "knew him—ah—that is, I knew of him."

"A highwayman?"

"Nick Scrope his name was," answered the man with a nod, "hung at Maidstone assizes last year, and here he be—hung up in chains as a warning to all and sundry."

"The more shame to England," said I; "to my thinking it is a scandal that our highways should be rendered odious by such horrors, and as wicked as it is useless."

"'Od rot me!" cried the fellow, slapping a cloud of dust from his coat with his stick, "hark to that now."

"What?" said I, "do you think for one moment that such a sight, horrible though it is, could possibly deter a man from robbery or murder whose mind is already made up to it by reason of circumstances or starvation?"

"Well, but it's an old custom, as old as this here road."

"True," said I, "and that of itself but proves my argument, for men have been hanged and gibbeted all these years, yet robbery and murder are of daily occurrence."

"Why, as to that, sir," said the man, falling into step beside me as I walked on down the hill, "I won't say yes and I won't say no, but what I do say is—as many a man might think twice afore running the chance of coming to that—look!" And he stopped to turn, and point back at the gibbet with his stick.

Once more, though my whole being revolted at the sight I must needs turn to look at the thing—the tall, black shaft of the gibbet, and the grisly horror that dangled beneath with its chains and iron bands; and from this, back again to my companion, to find him regarding me with a curiously twisted smile, and a long-barrelled pistol held within a foot of my head.

"Sir," said he, "I must trouble you for the shiner I see a-winking at me from your cravat, likewise your watch and any small change you may have."

For a moment I hesitated, glancing from his grinning mouth swiftly over the deserted road, and back again.

"Likewise," said the fellow, "I must ask you to be sharp about it." It was with singularly clumsy fingers that I drew the watch from my fob and the pin from my cravat.

"Now your pockets," he suggested, "turn 'em out."

This command I reluctantly obeyed, bringing to light my ten guineas, which were as yet intact, and which he pocketed forthwith, and two pennies—which he bade me keep.

"For," said he, "'t will buy you a draught of ale, sir, and there's good stuff to be had at 'The White Hart' yonder, and there's nothin' like a draught of good ale to comfort a man in any such small adversity like this here. As to that knapsack now," he pursued, eyeing it thoughtfully, "it looks heavy and might hold valleybels, but then, on the other hand, it might not, and those there straps takes time to unbuckle and—" He broke off suddenly, for from somewhere on the hill below us came the unmistakable sound of wheels. Hereupon the fellow very nimbly ran across the road, and vanished among the trees.

CHAPTER V

THE BAGMAN

I WAS yet standing there, half stunned by my loss, when a tilbury came slowly round a bend in the road, the driver of which nodded lazily in his seat while his horse, a sorry, jaded animal, plodded wearily up the steep

slope of the hill. As he approached I hailed him loudly, upon which he suddenly dived down between his knees and produced a brass-bound blunderbuss.

"What's to do?" cried he, a thick-set, round-faced fellow, "what's to do, eh?" and he covered me with the wide mouth of the blunderbuss.

"Thieves!" said I, "I've been robbed, and not three minutes since."

"Ah!" he exclaimed, in a tone of great relief, and with the color returning to his plump cheeks, "is that the way of it?"

"It is," said I, "and a very bad way; the fellow has left me but twopence in the world."

"Twopence—ah?"

"Come," I went on, "you are armed, I see; the thief took to the brushwood, here, not three minutes ago; we may catch him yet—"

"Catch him?" repeated the fellow, staring.

"Yes, don't I tell you he has stolen all the money I possess?"

"Except twopence," said the fellow.

"Yes—"

"Well, twopence ain't to be sneezed at, and if I was you—"

"Come, we're losing time," said I, cutting him short.

"But—my mare, what about my mare?"

"She'll stand," I answered; "she's tired enough."

The Bagman, for such I took him to be, sighed, and blunderbuss in hand, prepared to alight, but, in the act of doing so, paused:

"Was the rascal armed?" he inquired, over his shoulder.

"To be sure he was," said I.

THE Bagman got back into his seat and took up the reins.

"What now?" I inquired.

"It 's this accursed mare of mine," he answered; "she'll bolt again, d'ye see—twice yesterday and once the day before, she bolted, sir, and on a road like this—"

"Then lend me your blunderbuss."

"I can't do that," he replied, shaking his head.

"But why not?" said I impatiently.

"Because this is a dangerous road, and I don't intend to be left unarmed on a dangerous road; I never have been and I never will, and there's an end of it, d'ye see!"

"Then do you mean to say that you refuse your aid to a fellow-traveler—that you will let the rogue get away with all the money I possess in the world—"

"Oh, no; not on no account; just you get up here beside me and we'll drive to 'The White Hart.' I'm well known at 'The White Hart'; we'll get a few honest fellows at our heels and have this thieving, rascally villain in the twinkling of an—" He stopped suddenly, made a frantic clutch at his blunderbuss, and sat staring. Turning short round, I saw the man in the beaver hat standing within a yard of us, fingering his long pistol and with the same twisted smile upon his lips.

"I've a mind," said he, nodding his

head at the Bagman "I've a great mind to blow your face off."

The blunderbuss fell to the roadway, with a clatter.

"Thievin', rascally villain—was it? Damme! I think I will blow your face off."

"No—don't do—that," said the Bagman, in a strange, jerky voice, "what 'ud be—the good?"

"Why, that there poor animal wouldn't have to drag that fat carkiss of yours up and down hills, for one thing."

"I'll get out and walk."

"And it might learn ye to keep a civil tongue in your head."

"I—I didn't mean—any—offence."

"Then chuck us your purse," growled the other, "and be quick about it." The Bagman obeyed with wonderful celerity, and I heard the purse chink as the footpad dropped it into the pocket of his greatcoat.

"As for you," said he, turning to me, "you get on your way and never mind me; forget you ever had ten guineas and don't go a-riskin' your vallyble young life; come—up with you!" and he motioned me into the tilbury with his pistol.

"What about my blunderbuss?" expostulated the Bagman, faintly, as I seated myself beside him, "you'll give me my blunderbuss—cost me five pound it did."

"More fool you!" said the highwayman, and, picking up the unwieldy weapon, he hove it into the ditch.

"As to our argument—regardin' gibbetin', sir," said he, nodding to me, "I'm rayther inclined to think you was in the right on it arter all." Then, turning towards the Bagman: "Drive on, fat-face!" said he, "and sharp 's the word." Whereupon the Bagman whipped up his horse and, as the tired animal struggled forward over the crest of the hill, I saw the highwayman still watching us.

VERY soon we came in view of "The White Hart," and scarce were we driven up to the door than down jumped the Bagman, leaving me to follow at my leisure, and running into the tap, forthwith began recounting his loss to all and sundry, so that I soon found we were become the center of a gaping crowd, much to my disgust.

"Galloping Dick himself, or I'm a Dutchman!" he cried for the twentieth time; "up he comes, bold as brass, bless you, and a horse-pistol in each hand. 'Hold hard!' says I, and ups with my blunderbuss; you remember as I ups with my blunderbuss?" he inquired, turning to me.

"Quite well," said I.

"Ah, but you should have seen the fellow's face, when he saw my blunderbuss ready at my shoulder; green it was—green as grass, for if ever there was death in a man's face, and sudden death at that, there was sudden death in mine, when, all at once, my mare, my accursed mare jibbed—"

"Yes, yes?" cried half-a-dozen breathless voices, "what then?"

"Why, then, gentlemen," said the Bagman, shaking his head and frowning round upon the ring of intent faces, "why then, gentlemen, being a resolute, determined fellow, I did what any other man of spirit would have done—I—"

"Dropped your blunderbuss," said I.

"Ay, to be sure I did—"

"And he pitched it into the ditch," said I.

"Ay," nodded the Bagman dubiously, while the others crowded nearer.

"And then he took your money, and called you 'Fool' and 'Fat-face,' and so it ended," said I. With which I pushed my way from the circle, and, finding a quiet corner beside the chimney, sat down, and with my last twopence paid for a tankard of ale.

CHAPTER VI

WHAT BEFELL ME AT "THE WHITE HART"

WHEN a man has experienced some great and totally unexpected reverse of fortune, has been swept from one plane of existence to another, that he should fail at once to recognize the full magnitude of that change is but natural, for his faculties must of neces-

sity be numbered more or less by its very suddenness.

Yesterday I had been reduced from affluence to poverty with an unexpectedness that had dazed me, and, from poverty I now found myself reduced to an utter destitution, without the wherewithal to pay for the meanest night's lodging. I fell into a gloomy meditation; and the longer I thought it over, the more dejected I became. To be sure, I might apply to Sir Richard for assistance, but my pride revolted at even the thought, more especially at such an early stage; moreover, I had determined, beforehand, to walk my appointed road unaided.

FROM these depressing thoughts I was presently aroused by a loud, rough voice at no great distance, to which, though I had been dimly conscious of it for some time, I had before paid no attention. Now, however, I raised my eyes, and fixed them upon the speaker.

He was a square-shouldered, bullet-headed fellow, evidently held in much respect by his companions, for he occupied the head of the table, and I noticed that whenever he spoke the others held their peace, and hung upon the words with much respect.

"Yes, sirs," says I, "he began, with a flourish of his long-stemmed pipe, 'yes, sirs, Tom Cragg's my name an' craggy 's my natur', says I. 'I be 'ard sirs, dey-vilish 'ard an' uncommon rocky! 'Ere 's a face as likes good knocks,' I says, 'w'y, when I fought Crib Burke o' Bristol 'e broke 'is 'and again' my jaw, an' I scarce knowed 'e 'd 'it me till I see 'im 'oppin' wi' pain. 'Come, sirs,' says I, 'who'll give me a black eye; a fiver's all I ask.' Well, up comes a young buck, ready an' willin'. 'Tom,' says 'e, 'I'll take two flaps at that figger-head o' yourn for seven guineas, come, what d' ye say?' I says, 'done.' So my fine gentleman lays by 'is 'at an' cane, strips off 'is right-'and glove, an' 'evin' back lets fly at me. Bang comes 'is fist again' my jaw, an' there 's my gentleman a-dabbin' at 'is broken knuckles wi' 'is 'ankercher. 'Come, my lord,' says I, 'fair is fair, take your other whack.' 'Damnation!' says 'e, 'take your money an' go to the devil!' says 'e, 'I thought you was flesh an'

START THE STORY HERE!

YOUNG PETER VIBART takes to the Broad Highway, his uncle's legacy of ten guineas his only fortune. Having taken leave of his friends, Sir Richard and Adams, the groom, he determines to make a man of himself by honest labor somewhere in country England. In doing so, he turns his back on the prospect of inheriting his uncle's fortune by marrying Lady Sophia Sefton, whom he has never seen—a condition also open to his dissolute cousin, Sir Maurice Vibart.

blood an' not cast iron!" "Craggy, my lord," says I, gathering up the rhino, "Cragg by name an' craggy by natur', my lord," says I.

Hereupon ensued a roar of laughter, with much slapping of thighs, and stamping of feet, while the bullet-headed man solemnly emptied his tankard.

"Now, Tom," said a tall, bony individual, chiefly remarkable in possessing but one eye, and that so extremely pale and watery as to give one the idea that it was very much overworked, "now, Tom," said he, setting down the refilled tankard at the great man's elbow with a triumphant flourish, "tell us 'ow you shook 'ands wi' the Prince Regent."

"Ah! tell us," chimed the rest.

"Well," said the bullet-headed man, stooping to blow the froth from his ale, "it was arter I beat Jack Nolan. The Prince 'e come a-runnin' to me, 'e did, as I sat in my corner a-workin' at a loose tusk. 'Tom,' 'e says, 'Tom, you be a wonder.' 'I done Jack Nolan up proper I think, your 'Ighness,' says I. (Continued on page 240)

A Breath of Inspiration

A New Use For the Early Morning Hours

WHEN I spade, and rake, and hoe in my garden, the work is never drudgery, because I have visions of the gay blooms I'll be carrying to this friend or that. For the real joy of possessing is always enhanced by the sharing.

Now, I have something that has given me as much joy as my little flower garden and I want to carry it to others. Especially to those others, who, like me, are tied down to home and family, with every minute of the day filled. Those who sometimes reach the point of wondering, "Will a day every come when I can find a little time to do some of the things I really want to do?" You see, I know that stage, I had just reached it when I found this panacea and I want to pass it on.

Each one of you knows that the early morning hours, between the time of your breakfast with "The Good Man of the House" and the hour when the children begin to stir, is your opportunity to get the baking, ironing, cleaning or other work well out of the way for a head start on the day's duties. Yes, that's the approved method for efficiency, but that's not my plan. I've succeeded in capturing these fresh young hours of the day for something else. I know it's a good time to brush dust and cobwebs from the corners of my house, but I have chosen rather to brush them from the corners of my brain and give my mind a little freshening, thus making for real efficiency in the end.

Mental Work Easiest in Morning

I am daringly, "deliberately and with malice aforethought" doing just what I most want to do, with this wonderful time that I have alone, in the early morning. And you cannot know until you've tried it the real treat I'm having. I have read some of the Classics that I haven't had time to think of in years and some of the newer, current things that one so needs in order to keep abreast of the times and keep out the dreaded ruts. Some mornings I've just roamed around the place, drawing real strength from the hills, the trees, and fields.

I've even learned the thirteenth chapter of Paul's letter to the Corinthians, that chapter that supplies one with all the needed antidote for the poisoned darts of the world—the one I always intended to memorize but could never find the time for. Then, again, I've written long letters to old friends who have forgotten my handwriting and who will have to open the letter to see whom it's from. In short, I've done some of those things that I wanted to, just for pure delight.

The result of all this is that I am able to meet the day's trials with more courage and strength because of renewed vision and inspiration gained at the very start of the new day. I believe that this plan will help any mother who wants to be a good soldier, to withstand the daily assaults of the enemy, make her less liable to the gas attacks of friends, increase her invulnerability to shell-shock from heavy toil and finally enable her to stand against the shrapnel fire of children's daily questionings and wranglings, all of which are in store for her when the entire family's day starts.—LUCILE WARD.

THE BLACK PRINCE FUCHSIA

One of the prettiest specimen plants I ever grew in a window was a black prince fuchsia. It was a veritable little tree and in the early spring before outdoor flowers were yet growing that fuchsia was loaded with blooms. It had literally hundreds of blooms on it at one time when at its prime. It was four years old and I do not know how long it might not have lived and bloomed if I had not loaned it to a graduating high school class to take to the hall. It died within a week.

The fuchsia, as I know now, will not stand a close, poorly ventilated room even for two days. I had several offers of five dollars for the plant, but was too proud of it to sell it, for I had grown it in an ordinary home, and where we had to wrap our plants up at night to keep them from freezing at that.—LEWIS COBB.

INDOORS AND OUT THESE CLEAR FALL DAYS

ONE of the easiest aprons to make—and such an economical one too!—is No. 1495. It takes less than two hours to make and costs about 70 cents, in gingham. Sizes, small, medium, large. The small size requires 3 1/4 yards 36-inch material, with 1/2 yard 32-inch material contrasting. Price 12c.

FROM small sizes to large this smart street dress is cut, and the inset vest and pleated panels are becoming to any figure. No. 1878 comes in sizes 16 years, 36, 38, 40, 42, 44 and 46 inches bust; size 36 taking 4 3/4 yards 36-inch material. Price 12c. The braiding or embroidery pattern 656 is 12c extra.

THIS morning dress was designed especially for the woman of mature build. The pattern provides for long or short sleeves. No. 1685 is cut in sizes 36, 38, 40, 42, 44, 46, 48 and 50 inches bust measure. Size 36 takes 3 3/4 yards 40-inch material, 1 yard contrasting, 3 yards binding. Price 12c.

To order: Write name, address, pattern numbers and sizes clearly. Enclose proper remittance in stamps or coin (wrap coin carefully) and send to Fashion Department, American Agriculturist, 461 4th Avenue, New York City.

"The most useful and attractive catalogue you have ever issued." That is the universal verdict on our Fall and Winter Fashion Magazine. You want a copy of course. Add ten cents to your order and it will be sent by return mail.

WOLVERINE

1,000-Mile Shoes

Cordovan Horsehide Double-Tanned

Redfield, Ia., May 29 1923
I have your good letter returning my money which I sent for shoes.
Now I want the shoes. I am wearing a pair of them now and they may wear out some day, although I doubt it.
I have been getting your shoes through my father, A. E. Smith, who is one of the oldest business men in Redfield, but he is not handling shoes.
Can't we fix it some way so that I can keep on wearing Wolverine shoes? You might send the order I gave you to A. E. at your present price C. O. D. Postage not included.
I particularly want the pair of work shoes so let me know if there is any way I can get them. You have no regular dealer in this territory that I know of.
Yours very truly,
W. L. SMITH.

Ask for

Hi-Cut

King of Storms

For oil man, hunter or woodsman, there's no shoe like this. It fits ankle and instep as comfortably as a low shoe. Almost impossible to wear out. Dries soft after wetting.

Dries Out Soft After Wetting

Easy to Wear but Hard to Wear Out

All leather used in Wolverine 1,000-mile horsehide work shoes is double-tanned by our own private process in our own tanneries.

We make no other shoe. Our entire organization is devoted to producing the world's strongest work shoe. We do our own tanning because it assures us the best leather. Horsehide is naturally the toughest leather used by man. For centuries it has been known as the strongest leather for dress shoes. Big league baseballs have horsehide covers because it is the only leather strong enough to stand such hard knocks. So we use it exclusively in Wolverine work shoes.

By our exclusive method of double-tanning we make it soft and pliable as buckskin. And it always stays soft. Other leathers dry out hard after wetting. Wolverine horsehide shoes dry soft as velvet. Wear them in water, mud and slush as often as you please. They'll always dry soft and comfortable.

We buy select horsehides for our leather. And only the choice Cordo-

van cut is used in Wolverine 1,000-mile shoes. Notice how thick the leather is—yet how soft it feels. Double-tanning means double wear and double comfort, too. You can wear these shoes in all kinds of weather. No matter how wet they get they dry out soft and pliable.

You'll find real economy in the wear they give. Wolverine horsehide shoes usually wear at least 1,000 miles. We are told they actually wear 3,000 and 4,000 or more. If you are naturally hard on shoes, you'll find them the most economical shoes you ever wore. And you'll enjoy new foot comfort at the same time.

There's a Wolverine horsehide shoe for every need. For farm or railroad, mines, oil field or woods, there's a special model that exactly suits conditions. And all are the same tough, pliable double-tanned horsehide.

If your dealer cannot supply you with Wolverine 1,000-mile shoes we'll see you are supplied by our nearest dealer. Write for catalog.

Wolverine Comfort Shoe

Tender feet welcome these shoes. They're soft and flexible as a moccasin. Yet wear like iron. And so light and easy, you'll never know they're on duty. For tender feet, or where you do not encounter wet weather, wear this comfort shoe.

The Broad Highway

(Continued from page 238)

"Tom," says 'e wi' tears in 'is eyes, 'you 'ave; an' if I 'ad my way,' says 'e, 'I'd make you Prime Minister to-morrer!' 'e says. An' slapped me on the back 'e did, wi' 'is werry own 'and, an' likewise gave me this 'ere pin," saying which, he pointed to a flaming diamond horse-shoe which he wore stuck through his neckerchief. The stones were extremely large and handsome, looking very much out of place on the fellow's rough person, and seemed in some part to bear out his story. Though, indeed, as regarded his association with the Prince Regent, whose tastes were at all times peculiar (to say the least), and whose love for "the fancy" was notorious, I thought it, on the whole, very probable; for despite Craggy's words, blatant though they sounded, there was about him in his low, retreating brow, his small, deep-set eyes, his great square jaw and heavy chin, a certain air there was no mistaking. I also noticed that the upper half of one ear was unduly thick and swollen, which is a mark (I believe) of the professional pugilist.

"Tom," cried the one-eyed man, "wot's all this we heard of Ted Jarraway of Swansea bein' knocked out in five rounds by this 'ere Lord Vibbot, up in London?"

"Vibbot?" repeated Cragg, frowning into his tankard, "I 'ave n't 'eard of no Vibbot, neither lord, earl, nor dook."

"Come, Tom," coaxed the other, "everybody's heard o' Buck Vibbot, 'im they calls the 'Fightin' Barronite.'"

"If," said Cragg, rolling his bullet-head, "if you was to ask me who put Ted Jarraway to sleep, I should answer you, Sir Maurice Vibart, commonly called 'Buck' Vibart."

AS may be expected, at this mention of my cousin's name I pricked up my ears.

"And what's all this 'bout him 'putting out' Tom Cragg, in three?" At this there was a sudden silence and all eyes turned towards the speaker, a small, redheaded fellow. "Come," said he, blowing out a cloud of tobacco smoke, "in three rounds! What d'ye say to that now, come?"

Cragg had started up in his chair and now sat scowling at his inquisitor open-mouthed; and in the hush I could hear the ticking of the clock in the corner, and the crackle of the logs upon the hearth. Then, all at once, Cragg's pipe shivered to fragments on the floor and he leapt to his feet. In one stride, as it seemed, he reached the speaker, who occupied the corner opposite mine, but, even as he raised his fist, he checked himself before the pocket-pistol which the other held levelled across the table.

"Come, come—none o' that," said the red-headed man, "I ain't a fightin' cove myself, and I don't want no trouble—all I asks is, what about Buck Vibart putting out Tom Cragg—in three rounds? That's a civil question."

"I says," cried Tom Cragg, flourishing a great fist in the air, "I says as 'e done it—on a foul!" And he smote the table a blow that set the glasses ringing.

"Done it on a foul?" cried three or four voices.

"On a foul!" repeated Cragg.

"Think again," said the red-headed man, "'t were said as it was a werry clean knock-out."

"An' I say it were done on a foul," reiterated Cragg, with another blow of his fist, "and wot 's more, if Buck Vibart stood afore me—ah, in this 'ere very room, I'd prove my words."

(To be continued)

A BIT OF WISE PHILOSOPHY

We owe it to ourselves, as well as to those about us, to do all we can to take the grayness out of life, to see the brightness of the day—the little joys that lurk around the corner if we but look for them—and we know not what the next one may bring.

If we don't go out meeting trouble half way, there's a chance that we might dodge it. "Sufficient unto the day is the evil thereof" should be our philosophy of life. Work, laugh and play. "Eat, drink and be merry" for to-morrow.—Why by to-morrow we may have talked ourselves to death!—MRS. R. G. ARMSTRONG.

Selecting Your Fall Hat

Points to Remember in Choosing Styles

IN the fall, woman's fancy seriously turns to thoughts of hats. She then takes stock of her looks—her good points which she wants emphasized, and her more undesirable characteristics which she needs to cover up. And it is encouraging that no matter how far from handsome she may be, there can always be found at least one good feature which the right hat will bring out.

The first point to be considered is the use to which it shall be put. And that is determined largely by how many hats a woman will need and where she shall wear them. It is comforting to know that the simply trimmed, dignified hat in black, or some neutral color, is always appropriate and goes well with practically any colored frock.

Next we must think of the shape of the hat and its relation to the figure and face. Before selecting a hat, place it properly on the head and take the full length view to judge the proportion of the hat to the face, shoulders, and hips.

Study Your Own Lines

In this connection remember that the repetition of any undesirable lines emphasizes those lines and should be avoided. For example, a tall thin woman may appear a bit shorter and less thin if she wears a low, broad crown and a rather large and drooping brim with flat trimmings. On the other hand, a smaller hat with a rather high crown and trimming and a rolling brim may make the chubby wearer happy in the belief that she is tall and thin. If the shoulders tend to be high, a hat with a straight or slightly uprolling brim will give a more pleasant line, while a dropping brim helps to improve sloping shoulders.

If a face is very narrow it should be broadened by a broad-brimmed, low-crowned hat, while exactly the reverse type of hat should be sought for by the plump, roundfaced woman. Always remember that a hat should frame the face and be subordinate to the individual's personality.

How make that pug nose look less puggish? Try a hat with a sailor brim or one which turns up slightly and not too abruptly from the face. This lengthens the line between the nose and brim of the hat. And to shorten the apparent length of the long-beaked nose, reverse the direction of the turn of the brim and shorten this line.

Even Freckles Can Be Wiped Out

What about wrinkles and freckles? The observant woman will discover that wrinkles run up and down. If, to this direction is added a decidedly poke-shaped bonnet, these lines are repeated, and where there were two or three wrinkles there seem to be many more. Cut this downward tendency of lines by introducing upward ones in your hat. Freckles will very nearly disappear if you make use of the shadow thrown by even a very narrow hat with a slightly irregular brim. The toque is probably the most comfortable type of hat that can be worn because of its size and the ease with which it can be kept on, and yet there is none more trying, for the colors and lines of the face stand out in bold relief and there is no softening of undesirable points. A little fulness and draping in the material help here greatly, but a woman should study the effect carefully from all sides before purchasing such a hat.

The color of the hat should relate to the garments with which it is worn and bring out the color of the hair, eyes and face. The person with a sallow complexion and light eyes would do well to avoid light shades of browns and greens. The woman with a great deal of color should be careful not to add much more in her hat. A black or dark colored hat will frequently make a semi-brunette appear more like a blonde, while a hat with a good deal of color tends to bring out the dark in the face and eyes. Grey hair revels in different tones of grey and soft lavenders and browns. The white skinned, pink-cheeked girl can wear most colors without thought, but the

older woman needs to study lights more carefully.

Trimmings should be simple and dignified and in keeping with the hat and costume. They may be bright or neutral, but they should always keep in mind that they are just trimmings and not the whole hat. They should follow the lines of the hat, and show a proper relationship to the figure.

Keep Hats in Good Condition

Most of us are thrifty and expect our hats to give us at least two seasons' wear. If we contemplate changing them next year, rip off the trimming, brush the trimming and the hat

IN THE COUNTRY

("La Vie Rustique")

HARK! the bells of dawning;
Now the village, yawning,
Hums like a hive in the bright
morning sun
Let us not delay, then;
To our work away, then,
Meadow, field, and pasture, and
poultry run.

Shepherds now depart,
And lead their flocks to pasture.
Wagons stand around
While horses paw the ground;
Off to town we start
To sell our cheese and butter,
Poultry freshly dressed,
Of eggs and cream the best.

Now the night is falling,
Silv'ry bells are calling,
Bidding us rest as our long labor
ends.

Now to set the table,
Then we'll tend the stable,
Home of humble toilers and faith-
ful friends.

Supper time is here!
Come share our simple bounty;
Joyously we vie,
Our trenchers heaping high.
If the night be clear,
With golden stars illumin'd,
Let us sing an air
Where each may have a share.

Drowsy nods each head, now;
Time to go to bed, now,
Leaving the watch dog to roam in
the yard
Sleep all eyelids darkens.
Save the dog, who harkens,
Lonely vigil keeping, a faithful
guard.

Old Belgian Folk Song (translated)

well before putting away. Velvet may be freshened by steaming and brushing; ribbons may be washed and pressed, and flowers and leaves may be brushed and freshened by paints and shellac, and used again. A frame and old pieces of material will make a new hat next year.

Let us summarize briefly, the points to be remembered in selecting a bonnet:

1.—Try on the hat and survey yourself from all sides, and from tip to toe to get the full effect of the hat and its relation to shoulders and hips.

2.—Select the hat which will bring out your most desirable points of color, features and build, and do not repeat undesirable lines.

3.—Place the hat squarely on the head on a line just above the eyebrows.

4.—Be sure your hat is subordinate to your personality and suited for its business.

5.—Do not buy the first hat you try on. Find out how several types look on you and then purchase the one which seems best suited to your face and figure. Do not shop for hats when you are all tired out or when you have no idea of what you want.—Mrs. E. B. TERBUSH.

Irons will not stick if a teaspoon of salt is cooked with the starch.

* * * *

A baked potato should be cracked the moment it is done to let out the steam.

Delighted!

THE following outstanding conveniences and advantages will be found in the new 1924 models:

1. Much greater cooking speed.
2. Higher cooking top—roomier, more comfortable working height.
3. Wide, substantial base shelf. A convenient place for heavy utensils.
4. Square grates, roomy, with ample space for pots and pans.
5. Rigid extra end shelf over oil reservoir—increases working space.
6. New, clean-cut straight-leg design—attractive—substantial.
7. Everlasting Brass Lower Reservoir.

Ask your dealer to demonstrate the new improved models.

Reviewing the Latest Eastern Markets and Prices

APPLE SHIPMENTS INCREASING

HERSCHEL H. JONES

SHIPMENTS of apples from eastern sections were increasingly heavy last week, and prices generally lower. The warm weather has been the chief factor in causing a dull market, as demand has not accelerated as much as might be expected at this season. The total receipts of apples at New York from all sections were equal to 520 carloads in the week ending September 22, compared with 191 cars the week previous, and in the week ending September 29 they ran much higher.

Two-thirds or more of present receipts are from New York State, chiefly Hudson River Valley. The Southern States of Maryland, Delaware, West Virginia and Virginia are next in importance now.

Up to September 25 the carlot shipments of New York State apples were only one-third of those shipped last year, or 1,278 cars, compared with 3,749 cars last season. While this year's crop in New York is low, reports from other Eastern States which have been shipping indicate a larger production than last year. New Jersey this season shipped 329 cars and only 318 cars last season, Maryland 267 this year and 153 last, and West Virginia 682 this and 365 last season. Virginia's shipments so far this season, on the other hand, were only two-thirds as great as last year's, and Pennsylvania's slightly less.

While carlot shipments of eastern barreled apples thus far this year are only two-thirds as large as last year, shipments of western boxed apples are about 80 per cent greater than those of last season at the same time. Most of the western shipments so far have been from California. Washington apples are coming into the market rather slowly.

As usual at this time of year, shippers are sending the poorer grades of fruit to New York for sale and putting the best into storage. This

makes a low and irregular market on lower grades. Prices quoted in Government reports do not represent the market on B grade or unclassified fruit, or less than 2½-inch size.

McIntosh are not yet at their best in the New York market. Much of the stock has been too green for immediate consumption and the Jewish demand is not very active yet. Highly-colored fruit of large size is sought by buyers. The best receipts last week were from Finger Lakes section and the Champlain Valley, some of which brought as much as \$1 per barrel above top on other McIntosh. Kings of good size and color were in demand. No market yet on Baldwins, which growers in Hudson Valley are now beginning to pick.

The following quotations cover sales of A Grade minimum 2½-inch New York State barreled apples on September

A considerable quantity of Canadian hay of a cheaper grade on the market is affecting local prices.

The summer drouth caused a heavy feeding of hay which should be used for winter purposes and this promises to lessen the usual supply.

DRESSED CALF RECEIPTS HEAVY

Heavy receipts of country dressed calves caused a lower market last week. By September 27, however, receipts began to lessen somewhat and strictly choice veals brought from 21 to 22 cents.

The market for live calves continued steady under light receipts. Lambs held fairly steady, but by the end of the week prices of \$14 were exceptional.

OVERSUPPLY OF MEDIUM EGGS

There is an increasing accumulation of medium grade and held eggs on the New York market with the result that

that the average yield of surplus honey up to September 1, was only 34.9 pounds, compared with 50 pounds last year. This should give a pretty accurate estimate of the season's production since 87 per cent of the honey is usually harvested by September 1. New York State honey production is reported this year at 71 pounds, compared with only 51 pounds last year and the five year average of 57 pounds. The unfavorable weather conditions of the past season have undoubtedly been a decided influence on the honey crop. This will evidently result in a stronger market later on.

New York Market quotations, September 27, as follows in 60 pound tins: Clover, extracted, per pound, 10 to 13c; Buckwheat, extracted, per pound, 10 to 11c.

CASH GRAIN QUOTATIONS

Cash grain quotations on September 28, were as follows:

NEW YORK: WHEAT—No. 2 red, \$1.21½. CORN—No. 2 yellow, \$1.12½; No. 2 mixed, \$1.11½; No. 2 white, \$1.12½. OATS—No. 2 white, 52 to 52½c; No. 3 white, 50 to 50½c; ordinary, white clipped, 55 to 56½c. RYE—80c. BARLEY—77½ to 78½c. CHICAGO: WHEAT—No. 3 red, \$1.07. CORN—No. 2 white, 92½c; No. 2 yellow, 92½ to 93½c. OATS—No. 2 white, 43½ to 44½c. BARLEY—57 to 60c.

ber 28, per bbl.: GREENINGS, best, \$5.50 to \$6; fancy, \$6.25 to \$6.50; ordinary, \$4.50 to \$5. HUBBARD-STON, \$3 to \$3.50. MCINTOSH, best, \$6 to \$7; fancy, \$7.25 to \$7.50. KINGS, best, \$5 to \$5.50; fancy, \$5.75 to \$6.

CABBAGE WEAKER

Due to heavy rains last week the cabbage in New York State grew very rapidly and the New York City trade is discriminating against the large stock. A medium sized head, about four pounds, is preferred. The market was weak with shippers offering carlots freely at \$20 per ton f.o.b. loading point.

POTATO MARKET DULL

Throughout the country from the different potato growing sections, carlots have been moving this past week in hundreds and the total for the United States on some days has exceeded 1,700 cars. The receipts in New York City from Maine have been heavy and wholesale dealers have had difficulty in moving full weights, 180 pounds, as low as \$3.25, top \$3.50.

Long Islands were quoted in carlots bulk at \$1.25 bushel, loaded, and in 150-pound sacks at \$3.40 f.o.b. Buyers are having everything their own way and are buying from day to day at concessions.

The digging in New York State is light and few cars were being offered. Within a week or two "States" will be moving more freely.

HAY MARKET IMPROVES

Light receipts of hay resulted in an increasingly firm market. On September 27 some number one hay was sold at \$29 per ton. There continued to be an oversupply of small bales, however, which moved slowly.

the market continued weak. At this season of the year it seems that farmers are inclined to hold their eggs longer than usual because of the diminishing production of their flocks. The outcome is, that the market is swamped with inferior grade eggs. The farmer who does this is sure to lose money, for at the same time higher grade eggs shipped promptly to market begin to move up in proportion to their scarcity.

During the last week there was an unusual scarcity of fancy fresh eggs and a heavy glut of prime and medium eggs. Prices of nearby extra hennerly whites advanced two cents per dozen while medium grades met a very dull demand even at lower prices.

Two cars of fresh eggs were exported to England during the week. It is reported that several other cars of storage eggs are contracted for export. The cost of rehandling and candling storage eggs for this trade amounts to about six cents per dozen and unless a great difference develops between the home and English market, it appears unlikely that any large quantity of storage eggs will be exported.

BUTTER SLIGHTLY FIRMER

The butter market became slightly firmer toward the end of the week following a decline of one-half to one cent. Fresh butter generally was rather weak on account of heavy withdrawals of storage butter. The chain stores began using storage butter exclusively on which they realized a handsome profit. Imports dropped off somewhat because of higher prices in foreign markets.

HONEY YIELD LOW

Reports to the United States Division of Crop Estimates from farmers throughout the United States, indicate

How To Sell Your Poultry

(Continued from page 230)

commands the highest prices just as does every other highly seasonal product which is ready for sale before the mass. Broilers are very scarce in late April, May and June, for example, so that they bring a big premium over fowls and a much higher price than later on when the supply becomes more abundant. The farmer who can have broilers weighing from one and a half to two pounds to market early in the season can be certain of handsome returns.

Since a bird which is a "broiler" at one stage of its growth becomes a "fryer" later on, and still later a "roaster" and then a "fowl" or "stag," it is not so easy to determine the comparative merits of selling at different seasons of the year. The chart on page 230, however, shows the trend of prices on the different kinds, using quotations on fresh-killed western chickens at New York. Live chicken prices maintain a fairly uniform differential below dressed. Broilers decline during July and August from their

spring high point, but have averaged fairly stable as between the different months thereafter. The demand for them usually is excellent during the fall. Starting in September, roasters decline until December and January, which are the low months. Fowls reach their peak in March, April and May, when they are laying heavily and are kept back on the farms. December is the low point as young chickens are plentiful then, but prices in other months show much stability.

Avoid Glutted Markets

In view of the normal downward trend during the fall months, it would seem advisable to sell well-finished spring chickens in late September and October instead of glutting the market in the early winter when the peak of receipts normally arrives. At this time, packers are storing the surplus of dressed poultry and will attempt to keep quotations for both live and dressed stock on the lowest possible level. Greater weight may be obtained by holding the poultry until late in the season, but against this must be weighed the lower price, and the change from broiler to fryer or roaster prices, to say nothing of the labor and feed involved. Spring roosters are classified as "stags" beginning around the first of the year and sell at a lower price.

Marketing the Leghorn

Leghorns, which are in a class by themselves as producers of fine white eggs, have long been discriminated against in the poultry market all along the line from shipper to consumer. The discount may be as much as six to eight cents a pound. Since the breed is small and does not yield readily to fattening, those of the usual broiler size are older than the more meaty breeds and their large combs make the consumer think they are older than they really are. They often dress out dark also. The best way of handling them appears to be to sell the surplus roosters as squab broilers weighing from three-fourths to one and a fourth pounds. Up to that weight they grow well, but become too "scrappy" thereafter. The main demand is for fat yellow-skinned birds such as are produced by the general purpose breeds which predominate in farm poultry flocks. Strangely enough, European consumers are partial to white-skinned birds.

In general, chicken prices do not respond so strongly to the holiday trade as do other classes of poultry for which the demand is more partial. Also, extremely large receipts of chickens at those seasons largely offset any increase which does occur in the demand. One advantage of selling direct to consumers is that the producer can sell the year round and is in better position to average his returns.

Capon production offers excellent possibilities for enterprising farmers as the market for them is never overloaded. They should be made to weigh at least seven pounds. The best time to market them is in January or February, just after the turkey season, and they sell on about the same price level as turkeys.

Holidays Affect Best Market Days

The best market days in the large cities as a rule are from Tuesday to Friday, inclusive. In the case of an approaching feast day, however, there is a demand every day in the week. Jewish holidays, of which there is a series along in September and October, and again during the spring, create a special demand for fat, live poultry, which is then slaughtered according to certain Jewish regulations. The exact time of these holidays varies from year to year. If the producer wishes to strike this market, his poultry should arrive two or three days before the holiday.

Another question involved in marketing this year's surplus is whether poultry production generally should be expanded further. The increase in the last few years has been more rapid than the increase in the demand. The saturation point of the egg and poultry market has not been reached and moderately lower prices could prevail before production would be at a loss. But, for the good of all, it is probably desirable to slow down the process of expansion to a rate more nearly equal to the annual increase in the consuming population.

\$85,265 a day for taxes

Railroads, of course, should pay a proper amount of taxes, but it must be remembered that whatever they pay must be passed on to the public through rates.—
Congressional Joint Commission on Agriculture.

New York Central Lines paid taxes last year averaging \$85,265 a day, an increase of 221% as compared with 1910. For the year the tax bill was \$31,121,832, an amount considerably greater than the total dividends paid to the stockholders.

For the railroads of the entire country the increase in taxes as compared with dividends since 1913 has been as follows:

	1913	1922
Taxes	\$127,725,809	\$301,003,227
Dividends	\$322,300,406	\$271,576,000

Taxes are a part of the cost of railroad operation, which must be provided for in freight and passenger rates, just as are expenditures for wages, coal and materials. New York Central Lines pay more than one-tenth of the railroad taxes of the country.

A Simple Problem in Arithmetic

According to an investigation by the University of Illinois on 66 dairy farms, it was found that 133.9 hours per year were required to milk a cow by hand. A De Laval Milker will cut this time in two and save at least 62 hours per cow per year over hand milking, and at 15 cents per hour a saving of \$9.30 per cow per year will be effected, which is equal to 6% of \$155 for just one cow, or \$1550 for ten cows, etc.

This is a very conservative way of figuring the value of the time-saving feature of a De Laval Milker. In actual use it may save a man; or if a man is still retained it may mean that more cows can be kept or that he can devote all his time to other work, the owner looking after the milking himself. Or it may mean that a boy or some other person not capable of doing much milking by hand, with the aid of a De Laval can take the place of a grown man. There are many situations impossible to foresee that may justify the purchase of a De Laval Milker, and which often do save enough in other ways to pay for a De Laval in a year.

But saving time is only part of the advantage of a De Laval Milker. Suppose a De Laval, because of its uniform, vigorous and stimulating action, will increase production 10%. Of course the De Laval Company can't guarantee such an increase, as there are so many uncontrollable factors, such as health, feed, climate, care, etc. But practically all De Laval

Milker users, and especially those who weigh their milk and know, do say they get more milk, taking the herd as a whole over a period of a year—some as high as 20%; and 10%, based on the results obtained by many users, seems conservative. Ten per cent of 5000 pounds of milk per year—about the average production per cow per year—is 500 pounds, which at \$2.20 per cwt., the average price of fluid milk in the United States delivered at country stations during 1922, would be \$11.00 per cow per year. Then add

this to the value of the time saved, which is \$9.30, and you will have a total gain of \$20.30 per cow per year, due to the use of a De Laval Milker. Multiply this by 10, 20, 30, or the number of cows you are milking by hand, and you get a very conservative idea of what a De Laval Milker really will make you in profit.

In addition, when it is considered that cleaner milk can be produced, that the drudgery and dislike of hand milking are eliminated, and that dairying is made more pleasant for owner, son or hired man, you have the answer why so many people are installing De Laval Milkers—and especially when it is borne in mind that a De Laval Milker can be bought on such liberal terms and such long time that it will actually pay for itself as it is being used. Full information can be obtained from your De Laval Agent, or by writing us at any of the addresses below.

Dairying As They Did It in Father's Time—By Jared Van Wagenen, Jr.

A Square Deal For Country People

Rural School Bill Means Better Schools For the Same Money—A Radio Talk

By R. P. SNYDER

I SPEAK for nearly four hundred thousand boys and girls who live on the hills and in the valleys—on the farms and in the hamlets of rural New York—the great hinterland of the Metropolis. In another generation those for whom I speak will be scattered throughout the cities, villages and rural sections of the Empire State. They will be the citizens upon whom will rest in a large part the responsibility for settling many of the difficult problems of our increasingly complex civilization. It not only is their birthright to have as good an opportunity as anyone for an education, but the State's interest requires that they have that opportunity. While it is true that both city and country present perplexing and difficult questions, without doubt the most outstanding problem in education that confronts the people of New York State is the one of the rural school.

The Situation To-day

When our State system of schools was established, the educational facilities provided in city and country did not differ greatly. People thought of the schools in terms of the three R's and those were the subjects taught. If the teachers were poorly trained in the country so were they in the city. Then population and wealth were quite evenly distributed and consequently the cost of schools was much the same everywhere.

But what is the situation in 1923? Facts that cannot be controverted show that in all essential particulars the boys and girls who attend school in the country districts are not provided with as good educational facilities as are those who attend school elsewhere.

For example, as a whole the poorest school buildings in the State are the 8,600 one-room buildings. Most of them are over fifty years old. Less than fifteen per cent of them are properly lighted, heated and ventilated. The general condition of the larger buildings in the State's school system is much better.

Trained teachers no less than trained physicians or lawyers or stenographers are desirable. Both city and rural children should be taught by such teachers. It is generally claimed that at least two years of preliminary training are necessary to prepare one for the profession of teaching. There are many good teachers in the country, but less than five per cent of the teachers in the one-room schools of New York State have had two years of training. In the cities, more than eighty per cent have had such training. Nearly sixty per cent of the teachers in the one-room schools change positions and more than half of the trustees are new each year.

The Comparative Progress of Pupils

Those of us who live in the country like to think that the rural school is an efficient institution because many of the successful professional and business men and women of the cities came from the country. The Almighty did a lot for the rural boy when he placed him in the country. It is the place where qualities that make for success are developed. He just naturally gets an education there. He sometimes gets it in spite of the disadvantage of inadequate school facilities. The real test, however, is to apply the educational yard stick and measure the progress that boys and girls are making in the rural schools as compared with the progress made by city boys and girls. This has been done and it is known positively that boys and girls in rural schools are not as far advanced for their age in any subject as are those who attend school in the cities and larger villages. In most subjects they are at least one full year behind their city or village cousins. We are speaking now of the aver-

age boy and girl and not of the exception that we often meet.

There are hundreds of boys and girls in the rural communities who do not go to high school because their parents are financially unable to pay for their transportation as is required under the present system. A study made by the Military Training Commission a few years ago showed that employed farm boys had left school having completed fewer grades than any other class of employed boys in the State.

Cost of Rural Education High

In spite of the meager facilities provided, the cost of education in most rural districts is very high. What would the city dweller think for instance of paying for school purposes alone a tax rate of three, four or five per cent. In many rural districts this is not uncommon. In a recent study, one district was found that had a school tax rate of nearly twelve per cent. And this high cost is in districts where an elementary school only is supported.

If, as stated, there was at first equality of opportunity and a fair distribution of the cost of maintenance what causes the present inequalities? If we consider the history of our school development, the answer is clear. Our present State system of schools may be traced back to 1812. In that year in response to the demand of leaders of public opinion, the Legislature enacted a law laying its foundation. It was nearly forty years later that the people of the State declared by popular vote in favor of the establishment of tax supported free public schools. When it had been decided to establish public schools, it was necessary that there be machinery for their administration. It was natural that small neighborhoods within which the social and economic activities of the people of that day were carried on should become the units of taxation and administration for the support of schools. Thus originated our district school system. It was the natural and proper unit of administration for primitive times.

Advances in Social and Economic Life

The railroads, the automobile, improved highways, the telephone, the telegraph, the concentration of wealth and of population in a few large centers have brought about great changes in social and economic life since 1812. People no longer live in the small school district. Yet they retain it as the unit of administration for schools. In the beginning it was established as such because it was the unit of local activity in all things.

Our present difficulty is due to the fact that New York State is attempting a 1923 undertaking with an 1812 piece of machinery. It cannot be done. It is the fault of no one in particular that the present situation exists. It is the fault of all of us both urban and rural if we do not correct it.

The Rural Education Bill introduced at the last session of the Legislature was intended to lay the foundation for remedying the present inequalities. It was based on a most careful study of rural school conditions conducted over a period of three years by some of the best authorities in the field of education. The bill is not radical in its provisions. It does not provide for any new officials to administer the work of the schools. It does not extend centralized control of the schools, but places a large measure of responsibility in their control on the localities where the schools are maintained, excepting only such State control as has always been recognized as necessary to insure that proper standards will be maintained.

It is recognized that under our form of government we can make progress only by consent of and with the help of a majority of the people. In schools as in other things, this must be done by building on the institutions of the past and not by tearing them up and putting new ones in their place.

What Is the Community District?

The principal features of the bill are: first, a larger local unit of taxation and administration constructed according to the social and economic activities of the people of 1923 instead of 1812. This local unit would be known as the community district. It would be established by grouping the present school districts embraced in the territory of the natural community district. It would be established without regard to town or county lines because people disregard those lines in this hill and valley State in conducting their social and business affairs. With the help of the State, people of the community district would be required to provide for the elementary and high-school education of all the children of the district. Each present district would be a part of the larger community district for taxation and administration purposes, but would have at least one representative on the community board of education.

Consolidation Only by Local Vote

The community board of education would have charge of all the schools in the community district. The consolidation of schools within the community district could be brought about only by majority vote of the electors in the districts affected. Those who know the difficulties of transportation especially in winter in certain sections of our State will understand the wisdom of this provision. Besides, the one-room school is not a failure as a school for the lower grades if the physical surroundings are satisfactory and the teacher is well-trained. It is when the one-room school tries by itself alone to do the whole job that it falls down.

Fathers and mothers know that when their boys and girls reach the adolescent age which comes at about the end of the sixth grade, they need to be associated with other boys of a corresponding age and taught by teachers who have been trained to know and deal with their developing bodies and their expanding intellects. This is what is done in the cities under the junior high-school organization. Rural boys and girls are entitled to the same privileges under a State system of schools. Therefore, if the bill becomes law it will be possible to have the well-equipped and well-taught one-room school for small children where the people of a school district want it, and at the same time to provide proper facilities for the older boys and girls. Experience shows that many of the older pupils will leave school if new interests are not provided to hold them. The bill takes care of fundamentals like taxation and leaves details to be worked out by the people. It is the American way of settling the question.

More Financial Help From State

Second, larger State aid would be provided for rural schools. Nearly ninety per cent of the State's wealth is located in a few large centers of population. Obviously if good schools are to be provided for all children as the State's interest demands, there must be liberal aid from the State as a whole to support the rural schools. Therefore, taxation would be equalized, first, by the larger community unit described heretofore, and second, by State aid apportioned in accordance with

Dairying As They Did It in Father's Time

"The Old Order Changeth, Giving Place to New" But—

JUST this week when in our most central New York State city once famous for its salt, there is being held what is without doubt the greatest exposition of dairying in all its branches that the world has even seen, it may be well to remember for a little the beginnings of this great industry when it was still a farm and household art.

Lord Macaulay, in the opening sentence of his monumental History of England, lays a broad foundation for his task: "I purpose to write the history of England from the accession of King James, the Second, down to a period within the memory of men still living." Now I do not purpose to write the history of dairying, but only to set down a few outstanding events in its evolution, more especially as developed in New York State.

Our calling is as old as the race—certainly as old as any bit of recorded history. In the very beautiful pastoral story told in the first half of the eighteenth chapter of Genesis, Farmer Abraham entertained three distinguished guests and set before them "a calf, tender and good," and also milk and butter.

The cow was of European origin, but she migrated to America along with the earliest colonists. In Longfellow's poem, "The Courtship of Miles Standish," the Pilgrim Fathers are made the possessors of a "milk-white bull," but doubtless this is poetic license rather than sober historical fact. Probably the very first place in America where dairying was highly developed was in Orange County, N. Y. For more than a century it has been a wonderful cowland. Long ago the old Orange County Bank printed its banknotes in yellow to signify that butter was the source of the wealth and prosperity of the county. In this county, too, was the cradle of the great milk shipping industry. About 1847 or 1848, the first milk to ever reach New York by rail came in from the vicinity of Warwick, Orange County, over the then newly constructed Erie Railroad. Tradition has it that no other containers being available, shipment was made in oak churns, and if the supply was insufficient there were surely plenty of country coopers who could build one complete on a few hours' notice. I have been unable to

By JARED VAN WAGENEN, JR.

obtain even a hint as to the price paid producers, but feel sure that they were not annoyed by either stable inspectors or bacterial counts. I have read the old journals with the butter market reports for those years. There were just two classes of butter, "Orange County" and "Western Dairy." The former meant butter produced in southeastern New York and the latter, which was much lower in price, was from farther afield

painted barn, with mountainous piles of manure under the eaves, was much in evidence. To-day Delaware County is wonderfully supplied with great modern barns and fine stables often lighted with electricity—mute evidence that despite much grumbling dairying makes something more than a bare living for the man who follows it with intelligence and enthusiasm. I especially remember that cottonseed meal was at that time a new, strange feed in our locality, but Delaware County was already using it in large amounts and the yellow bags on the farm wagons were a constant source of interest to us.

This is not really ancient history—only 32 years ago—but the creamery at Stamford operated an enormous dash-churn, the power being furnished by a steam engine through a contrivance very much like the walking beam on an old-time Hudson River steamboat. Most farmers made their own butter in deep, cool, whitewashed cellars and packed it in firkin-casks of native oak, which were filled full and then headed up and stood

in long rows against the cellar walls. These were the famous "Delaware long dairies" of the New York butter trade. In autumn these were purchased and the buyers sawed them through the middle, thus making two tubs and exposing a fresh surface for inspection and sampling. Judged by the present standard for "92 score" and "creamery extras," I fear it would be considered pretty low grade stuff, but it was the very best of its time. Gone are the "long dairies," even from Bovina. Gone, too, the ancient art of the Scotch housewives of Delaware, but the great plants of the Sheffields and others, with their spotlessness, their laboratories, their steam

sterilizers, and pasteurizers, and automatic bottlers are handling more milk and bringing to the farmers more revenue than was ever dreamed of in the old days. But I—I would like to revive at least the memory of farm women making butter in shadowy, whitewashed cellars, but I can never see them again unless I shut my eyes. At that date most butter was made either from shallow pans or deep settings, but John McDonald, at Elk Creek, near Delhi, ran a separator from a water wheel, the power being carried on a long wire cable which served as a belt,

(Continued on page 254)

Don't Miss This!

ONE of the finest pieces of writing that has appeared in any farm paper is Mr. Van Wagenen's article on this page. We asked him to write something special on dairying and something special it is. It is a little story of the men and women of the past generation who laid the foundation of the greatest farm business in the world—the production of dairy products for millions of modern consumers.—The Editors.

and was probably shipped in over the old Erie Canal.

Both Orange and Delaware counties had a long and, in some ways, rather palmy history of butter production. I remember that in September of 1891, my father and mother and I took a drive mainly through Delaware and Otsego counties for the purpose of studying their dairy methods. We drove some 130 miles in five days behind a very leisurely team of farm horses. Delaware County has made great changes since then. Of course the hills were there, as well as the rows of beautiful maple trees that shade so many Delaware County roads, but the old, low un-

Let There Be No Price Fixing

FOR several months now great pressure has been brought upon the government by the farmers and particularly by the politicians of the northwest to do something to relieve the hard situation which the wheat farmers are now facing because of the low prices their product is bringing. Several plans and schemes have been proposed and considered.

One of these has merit and at this writing is being given much favorable consideration by the government. Briefly, it proposes to revive the War Finance Corporation, organizing all of the wheat growers in a cooperative under its direction and controlling the exports of wheat to foreign countries by holding this export surplus until the right time and then putting it on the foreign markets in an orderly way, and in accordance with the demand. It would be necessary for the government to finance the holding of the wheat until it could be sold, but the government would get this money back again when the wheat was marketed. The plan would not work wonders, but it has the merit of making the wheat farmers themselves cooperate to "sell their product by orderly marketing."

Another plan which is also said to be receiving favorable consideration consists in reviving the same War Finance Corporation and giving it the power to stabilize or in other words practically fix the minimum price of wheat at \$1.75 per bushel. This corporation was the one which practically fixed the price of wheat during the war.

We have raised wheat on our own farm in central New York and sold it below the costs of production, so we think we know how badly off the wheat growers are now. We are in sympathy with any sensible plan that will relieve the present discouraging situation; but as we have stated many times, we are decidedly opposed—and we believe the majority of thinking farmers in America are—to any price fixing scheme.

It was this very price fixing on wheat during the war that is the chief cause of the wheat growers' troubles now. Wheat at two

dollars and better a bushel caused an over-production, and over-production is the one and only real trouble that ails the wheat situation, and for that matter, the whole farm situation at the present time. Legislation to put the price up artificially and thereby interfere with the law of supply and demand simply temporarily dams up the flood and when the dam is removed later—as it must be, for price fixing at best can only be temporary—there will be a worse flood than ever. It is obvious that the wheat grower is not going to cut down his production very much while the government practically guarantees him a profit by fixing the minimum sales price.

And while we are at this price fixing business, let us be fair and if the government puts it on wheat, why not on cotton, eggs, milk, on everything in fact that the farmer grows? Why show any partiality?

One other thing that we must not forget is that all such fool schemes have to be paid for. When the government, which is the people, steps in and pays \$1.75 for something that is only worth a dollar, the tax-payer pays that extra seventy-five cents. Let us always remember that the government cannot pull the money right out of thin air, and do not forget either, that the farmer's property is nearly all in real estate, and real estate under our present tax system stands most of the burden.

If we could only have just a little common sense applied to all of these schemes that are being brought forth to help the farmer, we would see how foolish they are and what nonsense it is to rush to the politicians to cure our economic evils. It was long ago proven to the wise that it is impossible for anyone "to lift himself over the fence by his own bootstraps."

The Prohibition Vote

THE number of ballots received by American Agriculturist on the prohibition poll up to October 1 was 11,476. Of this number, 10,114 are for prohibition and the Eighteenth Amendment without any modification whatever; and 1,362 registered themselves in favor of modification. The percentage was 88 for the Eighteenth Amendment and 12 in favor of modification.

Already there is much interest on the part of magazines, newspapers and city people in this canvass. One representative of a magazine said that the pool of the farmers' vote was really very valuable because it actually proves how the farmers stand on this important question. Another result of the vote is that it is causing farm people all through the East to give serious thought and discussion in their Grange and other public meetings to the great problem of enforcing the law. An active public opinion is what is needed in America to-day on this question and the only way to make public opinion active is to bring out the discussion. Without exception, the ballots so far show no matter on which side the farmer or his wife voted, all were good American citizens enough to wish the law enforced while it is still a law.

On the opposite page is the ballot again. Separate supplies of ballots will be sent to any Grange or any individual upon application. Bring the matter up in your community, get a live discussion, and then register your vote and send it in.

Radio Time Changed

AMERICAN AGRICULTURIST and Department of Farms and Markets reports will now be given at 11:50 A. M., standard time instead of 10:50, and the Wednesday evening program will be broadcast at 7:50, P. M., instead of 6:50. These changes in time are caused by the change from new to standard time in the city. Both 11:50 in the

morning and 7:50 in the evening will be much more convenient for our people to "listen in."

We hope that you have made some arrangements so that you get these market reports. This is the time of year when the farmer sells what he has worked all of the long season to raise. If he sells well, his season's work is justified. Whether or not he sells well in many instances depends much upon his knowledge of when to put his products upon the market. American Agriculturist radio reports and its Market Page and other information on farm marketing will be of service to you if you will use them.

For several months now we have been furnishing every Wednesday evening the best farm speaker that could be obtained to talk to farm people on some of their problems. The many letters that we have received show how much these talks have been appreciated. We will continue to secure them for you, and all you have to do is listen in on your radio or visit your neighbor who has one on Wednesday evening at ten minutes to eight.

Dollar Makers

EVERYBODY is always looking for a chance to make an extra dollar. Also, everybody who has lived for any length of time has found one or several ways by which they have earned an honest dollar with some sideline. Here is another way to earn one—tell us how you did it.

In a short letter, told in as few words as possible, describe some little scheme or plan that you have carried out which you have found to be a money-maker, or a money saver. For every brief letter which we can use we will pay a dollar, and will occasionally print a column of them under the heading "Dollar Makers," letting other farmers and farmers' wives pass on to you in a few words their plans which made or saved dollars for them.

Eastman's Chestnuts

ONCE had an uncle who was a great story teller, but like all good story tellers, he often forgot that he had told you the same story about seventeen times before. So one day after he had just finished telling a particularly ancient joke, my brother handed him a little card on which was printed—

"Great Grandpa used to tell that."

When I told this little incident to my friend, Jerry Hammond, he said: "Well, Ed, your uncle didn't have anything on you. Take that Delaware County story of yours, now. I'll bet if I had a dollar for every time I heard you tell that yarn, I could buy a good suit of clothes."

Such lack of appreciation is very discouraging but all the same, I am going to tell that story again, even if I get run out of the country for it.

It seems that a stranger was riding along a Delaware County road on a hot summer day. Now in spite of the fact that Delaware County is one of the greatest dairying sections in the world, parts of it are exceedingly mountainous and a typical Delaware County road is quite likely to be bordered by a very steep hill on one side and a deep gully on the other. As the stranger proceeded, he saw what looked like a ball of dust come rolling down the steep hill and land in the middle of the road ahead of him. When he had hurried up his horse to see what had happened, he found a farmer picking himself from the dust in the road with much groaning and grunting.

"Why, mister, what is the matter?" he asked.

And the farmer replied: "Wall, now, I'll tell ye, stranger. I'm gittin' pretty nigh discouraged. That makes the seventh time I've fallen out of my corn field this mornin'."

Selling Farm Products in Local Markets

Another Suggestion to Get More For What We Raise—A Radio Talk

THE farmer's problem of selling his crops to the best advantage is, in my opinion, the most serious one that faces him to-day. Just merely getting rid of ones produce is not the method to follow; the farmer should "shop around" for the best price, just as the city buyer does in the market.

On my farm, located in the foothills of Dutchess County, we have the following commodities to sell: milk, potatoes, hay; straw, buckwheat, apples and tomatoes. We have tried out every conceivable method to get a fair price for ourselves and at the same time get as close to the consumer as possible.

Take the question of early potatoes this year. We consigned several hundred bushels of potatoes to a commission man in New York. By the time we deducted freight, cartage and commission, the price was far from satisfactory. So, we loaded our potatoes on our wagons and went to the nearest town, located ten miles from the farm. In two days, going from house to house selling the potatoes in lots of one to five bushels, we succeeded in getting the same price for our potatoes at home as we did in New York, without having to deduct freight, cartage and commission.

This year we raised a lot of early tomatoes. At the beginning of the season we had no difficulty in selling all we could pick at \$3.50 for a 14 quart basket, within a radius of twenty miles. These high prices continued for about two weeks when the bottom fell out of the market and it was difficult to get 50 cents a basket in our own community. Again we tried to market these tomatoes in New York through a commission man, and we barely received enough to pay for the transportation cost, while we continued to find a ready market at home at 50 cents a basket.

This summer I had something like sixty tons of hay to sell, and I was able to dispose of every ton for \$22 on my barn floor. This hay would grade as a No. 2 hay, and if I tried to send it to New York, I would have been lucky to net \$12 or \$15 a ton.

After having tried all kinds of methods, I believe that the market is one's own community, if properly studied and worked, will net the farmer more, nine times out of ten, than if he attempts to sell his produce on consignment in a distant market where he cannot control the price.

The difficulty which I have met in trying to market my farm produce locally has convinced me that if we had a farmers' public market in the largest city in our community, which happens to be Poughkeepsie, the difficulty of peddling our crops, which we now have to do in order to sell them, would largely be done away with, and it is for this reason that I believe it would be a constructive move to have farmers' public markets established in the centers of communities all over the State.

If for example the city of Poughkeepsie had a public market, it would encourage the farmers in Dutchess County to raise many more vegetables to sell in Poughkeepsie. At present, the housewives, on account of not having a common meeting

By HENRY MORGENTHAU, JR.

ground at which they can buy from the farmers, find it necessary to spend thousands of dollars for produce, which the merchants of Poughkeepsie buy largely from the commission men in New York City.

I am sure if investigators were to follow this produce to its source, they would be surprised to learn that a great deal of it originated right in the Hudson River Valley. Many local merchants, before they have carefully investigated the good and bad points of the public market, are opposed to having one in their community because they believe that through the public market the farmer is able to come in direct contact with the consumer, and in this way the local merchants might lose some business. As a matter of fact, the community in which a local public market is established, benefits very largely, because it permits the farmer to find a ready sale for a lot of perishable produce which heretofore he was unable to sell, and for every additional dollar which the farmer receives, the community in which he lives benefits directly.

A Help to Farmer and Consumer

I would like to see the farmers, the Department of Farms and Markets, Farm Bureau Agents and the Chamber of Commerce, all get together in every town in the State of over 10,000 population that has not got a farmer's public market. I do not know of anything that would help the farmer and the consumer to do business on a more equitable basis than if this could be brought about.

The American Agriculturist stands ready to put its shoulders to the wheel to help any community that wants to get a public market, as we believe that through the public market

place, the farmer gets more for his produce and the consumer pays less. If your community has no public market and you would like to find out how to go about starting a movement to obtain one, we would be glad to hear from you.

A Square Deal For Country People

(Continued from page 246)

the taxable resources of community districts and the expenditures which such districts are required to make to provide for the proper maintenance of public schools therein. The State would aid also in the erection of buildings and for the transportation of high school pupils.

The Element of Supervision

The third principal feature of the bill relates to supervision. It is an important provision, but it is not as important as the two preceding features. The present board of school directors whose members are elected at the general election and whose only duty is to appoint the district superintendent would be replaced by an intermediate board of education appointed in the supervisory district by the community board from their own members. This board would appoint the superintendent and as representatives of the people would have certain lay duties which the present board does not have. On the other hand the superintendent would have certain professional duties which he does not now have. Much the same relation would exist between the superintendent and the intermediate board that now exists between the city superintendent and the city board of education.

The bill also prescribes the powers and duties of boards of education, of district superintendents and of other school officers. This brief summary attempts to give only its principal provisions.

Perfect legislation does not come spontaneously. This bill, although more carefully prepared than bills usually are, probably is not perfect. Its sponsors are not dogmatic in their opinions. They are anxious to see that a square deal is given to rural boys and girls and to rural taxpayers. Nearly all State-wide educational and agricultural organizations are on record in favor of improved school facilities in rural communities.

Larger Units Necessary

That there is need for a larger local unit of administration and taxation is recognized. With nearly 90 per cent of the State's wealth located in a few centers of population, it is evident that the State must give larger aid to the rural schools. To make this possible it is imperative that the Legislature revise our century-old system of school administration.

Constructive criticism will be welcomed. Destructive criticism is a device of demagogues. Let those who are satisfied with present intolerable and unequal conditions say so in order that they may be known. Let all others, both rural and urban, join forces to correct this long-standing injustice.

PROHIBITION BALLOT

OF THE

AMERICAN AGRICULTURIST

Are You for the Strict Enforcement of the
18th Amendment as It Now Stands?

☐ YES

☐ NO

Are You for a Modification of the 18th
Amendment to Permit Light Wines
and Beer?

☐ YES

☐ NO

Designate your opinion by placing an X in the square opposite Yes or No on each question. Sign your name and address. Your name will be kept *strictly confidential*.

Name.....

Address.....

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

Get your friends to vote—More ballots furnished on application

The Great Usefulness of the New 1½ h. p. McCormick-Deering Engine

TO SEE the new 1½ h. p. McCormick-Deering Engine standing quiet, compact and unassuming at the dealer's store, it is hard to realize the great range of its usefulness and the degree of the power it will deliver at trifling cost of operation.

Two cents worth of fuel in this McCormick-Deering Engine will do any of these jobs:

Separate 4000 pounds of milk.
Pump 3000 gallons of water.
Shell 25 bushels of corn.
Grind 6 bushels of feed.
Cut 1 ton of ensilage.
Press 15 gallons of cider.
Grind 2 bushels of corn meal.
Saw 1 cord of wood.
Churn 200 lbs. of butter.
Bale ½ ton of hay.
Clean 30 bushels of seed wheat.
Grind 25 gallons of cane juice.
Light up the farm for 2 hours.
Do a family's weekly washing.
Grind the mower knives for a season.

Such many-sided labors may be turned over to this tireless hired man the day it is set down on your place and for years to come. It is of lasting reliability and you will know why when you have inquired into the details of its construction.

The new McCormick-Deering runs at low speed (500 r.p.m.). It is equipped with Bosch high-tension magneto and spark plug, removable cylinder, enclosed crank case, throttle governor, simple fuel mixer, and large, well-made, replaceable bearings. It has a simple cooling system and an unfailing oiling system.

This 1½ h. p. size operates on gasoline. The other McCormick-Deering Engine sizes, 3, 6 and 10 h. p., use kerosene as fuel. All are made of equally high grade materials throughout and include many of the features named above.

Write for detailed information. Stop at the McCormick-Deering dealer's store and go over the engine of the size you require.

INTERNATIONAL HARVESTER COMPANY
606 S. Michigan Ave. OF AMERICA (Incorporated) Chicago, Illinois

BEFORE YOU BUY A WINDMILL

Carefully consider the following facts: A year's supply of oil is sent with every Aermotor. The Auto-oiled Aermotor is the Genuine Self-oiling Windmill, with every moving part fully and constantly oiled.

The Auto-oiled Aermotor has behind it 8 years of wonderful success. It is not an experiment. The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet. Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

You do not have to try an experiment to get a windmill which will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine. Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Auto-oiled Aermotor is so thoroughly oiled that it runs in the lightest breeze. It gives more service for the money invested than any other piece of machinery on the farm. The Aermotor is made by a responsible company which has been specializing in steel windmills for more than 30 years.

Harvesting Potatoes

Proper Handling Will Avoid Injury to the Crop

THE desire to harvest the potato crop with all possible haste and facility in order to avoid unfavorable weather and to most efficiently use the available labor supply generally results in a crop of tubers the majority of which are more or less injured. Most of this injury can be avoided, and will be avoided if growers and shippers of potatoes can be made to realize that the necessary care in handling will pay. The rough handling to which the potato is annually subject is not, and probably would not be tolerated with any other perishable food product.

According to the United States Department of Agriculture, the disposition of the 1922 crop of potatoes was as follows:

Available for sale as food and seed, 57 per cent; used on farm as food and seed, 31 per cent; unfit for food or seed, 12 per cent.

The 12 per cent of the crop which was unfit for either food or seed is especially significant. It may be that this percentage was slightly higher

than average last year because of the abnormally large crop, which made it possible for the market to use greater than average discretion in its choice of quality. This assumption, however, does not minimize the importance of the factors involved in the present discussion. We may assume that this 12 per cent of tubers unfit for regular use consists of (1) small or cull tubers, part of which are the result of low breeding, disease, and unfavorable growing conditions; (2) diseased and insect-injured tubers not the result of rough handling, and (3) tubers defective either directly or indirectly as a result of rough handling. It is to the last named source of loss that growers and shippers have failed to give sufficient attention. The larger part of this mechanical injury results at digging time, the remainder at some subsequent time during which the crop is graded, sorted, bagged or shipped. It is not at all uncommon to find bins or piles of recently harvested tubers in which scarcely a single unblemished potato can be selected. This is especially true in regions where the crop is harvested before full maturity of the foliage. In the latter case the skin of the tuber is thin and very subject to injury. Also, because of the high water content of the tubers at this time, they are more subject to cracking and bruising during harvest. Careless use of hooks and forks in digging by hand, results in a type of tuber injury that, although perhaps not very apparent at the time, results later in a dry decay within the tuber and an almost total loss in value. Mechanical diggers, on the contrary, if not set at the proper depth in the row, result in cut or sliced tubers. Such injury, although less wasteful than the other kind, is, nevertheless, avoidable and must be removed from stocks to be sold as U. S. No. 1 Grade.

More Care at Time of Storage

It is fairly well known that newly-dug potatoes should be allowed to dry thoroughly before handling. This allows the skin to "set" and prevents peeling or chafing. During the early storage period the outer coverings of the tuber dry, thicken and contract to form a protective coat. This phenomenon is known as suberization from the fact that the covering so formed consists largely of a corky substance known as suberin. Less injury is likely to result from handling potatoes therefore if the mechanical grading and subsequent sorting can be postponed

until this suberization has progressed to a reasonable degree. When the economic factors concerned in storage and marketing make such postponement undesirable, greater care in handling should be observed.

Storage in Bags Undesirable

There is probably no better method of storage than in small open piles, bins or in slatted crates. This allows of proper curing and good ventilation. Bag storage over any protracted period has been found undesirable. Many growers have made the mistake of bagging the crop at harvest time for shipment at some future time without sufficient regard for the condition of the stock as to quality, which may have appreciably changed during storage. This has many times resulted in serious controversy between producer and buyer, especially in the case of seed potatoes. Both wet and dry rots naturally develop and cause progressive decay and shrinkage during such storage, depending upon the amount of injury and

A cross-section of a tuber that has made second growth, which eliminates it from U. S. Grade 1. Note knobby effect on stem end and the dark streak marking where second growth began

disease present in the crop at time of bagging. Such decay also tends to cause spoilage of the bag containers and results in an untidy commodity at the receiver's end. Frost or freezing injury during winter storage in bags may also occur. In any event, potatoes stored in bags should be re-sorted and re-bagged before final shipment.

With the promulgation of United States Grades for potatoes, this commodity is now quoted in the large terminal markets on the

basis of U. S. Grade No. 1. No matter whether the producer grades his product according to these standards or not, the price he receives for it in such a market is partly determined by its conformity to the U. S. standard and the prevailing market price for these grades. U. S. Grade No. 1 is defined as consisting of potatoes of similar varietal characteristics which are not badly misshapen, free from frost injury, soft rot, sunburn, second growth, growth cracks, hollow-heart, cuts, scab, blight, dry rot, disease, and insect injury. The diameter of potatoes of round varieties shall not be less than 1½ inches and of potatoes of long varieties, 1¼ inches.

This grade is not merely a standard for the establishment of uniformity in size of tubers but clearly a standard permitting a certain minimum of quality also. The grade cannot be made by the grower who merely sizes his crop and overlooks the tubers slightly injured by digging implements and rough handling. Fork or hook injury and bruises later result in what the grade specifies as dry rot. This clearly distinguishes dry rot as distinct from the dry rot of late blight. Other defects concerned in U. S. Grade No. 1 which are easily overlooked in grading are hollow-heart, sunburn and wireworm injury. A sunburned tuber, being tougher than a normal tuber, is fully as desirable and possibly more so for seed purposes. But it is worthless for eating because of its acrid taste and high poisonous content of the chemical solanin. All such tubers must be removed from U. S. No. 1 stock. Second growth tubers, as specified in the grading standard, are usually the result of unfavorable growing conditions. Late summer or fall rains, following a droughty period during summer, are likely to induce this second growth or knobby protruberances at the eyes or at the apical ends of the tubers. Such tubers result in much waste in preparation for cooking and

(Continued on page 258)

Concrete on the Farm

Materials That Enter Into the Making of Concrete

PROBABLY one of the reasons why more farm improvements are not made with concrete is because the average person is afraid his work will not be a success. The article on this page is the first of a series of four articles by Mr. Behrends on Concrete on the Farm. This article deals with those materials which enter into the making of concrete. Those following will cover in a practical manner the subject of concrete mixtures, mixing of concrete and placing concrete as applied to the very simplest of concrete jobs, such as concrete floors, walks or piers, requiring very crude forms. This series will be followed by articles covering more difficult concrete construction requiring more elaborate forms.—THE EDITORS.

By F. G. BEHREND

paper bags holding 94 pounds net weight. For

all practical purposes a sack of Portland cement may be considered as one cubic foot.

Cloth sacks are charged to the cement purchaser. When empty, they should be returned to the cement dealer, who will buy them back if they are fit for further use as cement containers. Cement sacks which have been wet, torn or otherwise rendered unfit for use are not redeemable. Paper bags are not returnable.

What is Meant by "Aggregates"

Sand and pebbles or broken stone are usually spoken of as aggregates. Sand is called fine aggregate and pebbles or crushed stone coarse aggregate.

Sand or other fine aggregate includes all particles from very fine (exclusive of dust) up to those which will just pass through a screen having meshes one-quarter inch square.

Sand should be coarse, hard and clean, that is free from dust, loam, clay or vegetable matter. The quality of

sand is largely dependent upon the relative coarseness of its grains. Coarse sand is usually considered as one made up of large and small grains in which the larger sized grains, that is, one-sixth to one-eighth inch in diameter, predominate.

To determine whether a sand is hard the following test is suggested: Select an average sample of the larger particles and strike them with an ordinary hammer. If any large proportion of the materials pulverize easily, the sand in question should not be used. Shale sands are unsuitable for tanks, troughs, cisterns, and most concrete work subject to weathering.

How may sand be tested for impurities? It is desirable to test every sand to determine the approximate amount of clay or loam or other foreign material in the sand. A very simple test is to fill a quart fruit jar to the depth of two inches with sand, fill the jar to within an inch of the top with clean water. Shake well and let set until the water clears up. The sand will sink to the bottom, while the mud, which is held in suspension longer, will settle on top of the sand. If the layer of mud is over three-sixteenths of an inch thick, the sand should not be used unless it is first washed. Concrete made from dirty sand or pebbles is not strong, hardens very slowly, and may never harden enough to permit the concrete to be used for the purpose intended.

Coarse aggregate includes all gravel, pebbles or broken stone ranging from one-quarter inch up to one and one-half or two inches. The maximum size of coarse aggregate to be used is governed by the nature of the work. In thin slabs or walls the largest pieces of aggregate should not exceed one-third the thickness of the section of concrete being placed, while for reinforced concrete one and one-half inches in diameter is the maximum size, which will work closely around the reinforcing. Pebbles or crushed stone to be used as coarse aggregate should be tough, fairly hard and free from any of the impurities that would be objectionable in sand.

Cinders may be used for the coarse aggregate provided they are carefully screened so they contain no fine material. They should be made up of clean, hard clinkers and contain no unburned coal.

Cinder concrete is not as strong as that made from gravel or crushed stone. When used, the mixture should be a little wetter than gravel concrete.

Only clean water should be used for mixing concrete.

The use of concrete about a farm increases the appearance of the place and, if properly handled, results in improvements of a permanent nature. Most of the farm jobs to be done with concrete are such that anyone can readily learn to do them. With the aid of such tools as are ordinarily found on the farm, a concrete walk, a cover for the well, or a concrete floor in the poultry house or stable can be built. Such work requires very little building of forms. Then there are the jobs such as building a new cistern, a foundation wall for a small building or a feed or a watering trough. Although these require more elaborate forms, the actual concrete work after the forms are constructed, is no more difficult than laying a concrete floor. Probably one of the reasons why more farm improvements are not made with concrete is because some dislike to start for fear that their work may not turn out satisfactorily.

The thing to do is to start in a small way. First build a short walk or a part of a cellar floor. Having made a start, and gained experience in proportioning, mixing and using concrete, it will be easy then to proceed to the more difficult jobs.

Concrete is often called an artificial or cast stone, and is made up of definite proportions of Portland cement, sand, and gravel or broken stone mixed with water and allowed to harden under proper conditions in forms or molds. The quality of this home-made stone will depend largely upon the kind of material from which it is made, the proper grading and mixing of these materials, the proper placing of the mixture and, last but not least, the proper curing of the mixture after it is placed.

What Is Portland Cement?

Portland cement is primarily a mixture of limestone or blast furnace slag and clay or shale heated until they begin to melt and blend together. The resulting clinker is then ground to a fine powder. Gypsum is added to control the rate of setting. Cement has the property of hardening when mixed with water and will hold together such substances as sand, gravel, crushed stone or cinders. This hardening process is called setting. Any of the standard brands are tested and guaranteed by the manufacturers and will produce good concrete provided the cement has not deteriorated in shipment or storage. If the cement is not lumpy, it is probably in good condition. This lumpy condition should not be mistaken for a caked condition caused from being piled up in a large pile.

If the lumps can be broken in the hand or between the fingers, the formation of the lumps was due to pressure on the cement and not to the presence of moisture. Sacks containing lumps that will not crumble under gentle pressure should be discarded.

Cement should always be stored in a dry place and be supported upon some type of platform so that the bags will not be in contact with the ground.

Portland cement is packed and shipped in standard cloth sacks or in

A concrete well-cover, neat, durable and sanitary, requiring the simplest of forms

We Help Farmers to Use Concrete

That is what the Portland Cement Association is for—to tell people the best and easiest way to use Concrete, and to show how it can save them money.

No matter what permanent improvements you need around your farm, whether it is a feeding floor, manure pit, silo, storage cellar or foundation, we can give you simple, easy-to-follow instructions for making it of Concrete.

Just write us and tell us how you are thinking of using Concrete, and we will send you the information you need free of charge.

You will be surprised to see how easily you can build permanence into your farm improvements with firesafe, weatherproof, economical Concrete construction.

A Wise Old Trapper

In the state of Ohio there lived a bunch of boys who had this trapping business down to a science. They each sent for separate price lists every year and then sent all their furs to the house giving the best quotations. After five years they decided they weren't so dreadfully wise because they didn't have enough profits to make their efforts worth while.

One day they met Tom McMillan driving a new car to town. Tom said he made the price of his swell outfit shipping pelts. He told how he got wise to those funny prices and found it was better to deal with Chas. Porter because he always knew in advance what he was sure of getting. He said that Porter never offered \$5 for a \$3 pelt but he always paid the \$3 which he promised and sometimes just a little better. Chas. Porter now has five wise trappers in that section instead of one.

Don't Take a Chance with your FURS

Send us your name and address. Get our Price Bulletin, Shipping Tags, and full particulars. Do it right now. This means real dollars to you, so don't put it off. Write today.

Your furs mean real dollars to you. Why sell them to some fellow who offers you \$1.25 when you know blame well you are lucky to get fifty cents. Ask the wise trapper who knows. Once a Chas. Porter shipper and you will always be one. You know in advance that we give a square deal and every shipment brings sure money.

Vegetable Growers Meet at Buffalo

By PAUL WORK

ONE of the outstanding features of the recent convention of the Vegetable Growers' Association of America was a popular evening session devoted to the value of vegetables as food. Dr. R. A. Dutcher of Penn State made an admirable presentation of the things that are known in a scientific way about vitamins. He was followed by Professors Flora Thurston and R. M. Adams, both of Cornell. The latter's droll rhymes made a decided hit with the large audience.

Practically the whole session of Tuesday was devoted to seed and variety problems. The growers seem determined that something shall be done to clear away the chaos of varieties and names with which they are compelled to deal. George Starr of Michigan proposed a short list of varieties which is intended to meet all important commercial needs. President A. B. Clark of the American Seed Trade Association advised growers to pick reliable seedsmen and then stand by them—not necessarily one house for everything, but rather the ones that specialize in certain items. He decried the desire to get high-class seeds at low-class prices, and he urged the practice of trying seed a year in advance of its use, buying it and storing it in the meantime. There are few kinds of seed that are subject to serious loss by being held over. He pointed out that some deterioration in germination is of little harm anyhow, especially if one gains assurance as to truthness, purity, and yield. He urged growers to make careful trial and comparison of seed from various sources, though warning against too hasty generalizing.

At the banquet G. V. Branch showed an effective movie of the new Detroit market and Dean R. L. Watts of Pennsylvania touched upon the human side of the business when he called attention to the value of a little guidance and encouragement in leading the young fellows to keep up the business.

On Wednesday morning the convention party took autos for a tour of the gardens of Erie County. At the farm of W. D. Henry and Sons, Dr. C. E. Ladd of Cornell gave figures selected from the results of ten years' intensive cost accounting. The crowd was especially interested in a chart which showed the rise and fall of labor costs for the period. After watching a power duster at work, the party went to the Hamburg Fair Grounds for lunch and then to the farm of C. A. B. Smith, where an extensive Cornell demonstration of cauliflower varieties and strains was studied.

If any one topic interests gardeners more than another, it is the small garden tractor. At the farm of George Webber, six types of these machines were in action. There seems to be general agreement among gardeners that they are here to stay.

On Thursday, R. S. Parsons, vice president of the Erie, presented the railroads' side of the transportation problem.

The climax of the meeting was reached when Aaron Sapiro outlined in his forceful fashion the principles that must be observed if cooperation is to be successful.

President, H. F. Thompson of Massachusetts; Vice President, A. H. MacLennan of Ontario; and Treasurer, H. J. Cheney of Michigan, were all re-elected, while George Starr of Michigan was chosen to succeed C. H. N. Nissley of New Jersey, whose duties no longer permit him to serve.

NORTHERN NEW YORK NOTES

Accredited herd work is proceeding rapidly in St. Lawrence and Jefferson Counties under the impetus given through having county veterinarians on the job. Dr. H. J. Baker has tested over 2,600 cattle in St. Lawrence County in the last two months. Thus far the average number of reactors has been about twenty per cent. There are many applications on file for tests.

Frosts early in the third week froze much of the corn and potatoes as well as damaging gardens all through the North Country. As a result there was a general rush all along the line to fill silos, for most farmers were delaying corn cutting in order to gain all the advantage they could from the late summer and fall rains. Late potatoes have made some growth since the rains began, but the crop will be short and only a few pieces that escaped the freeze will do any more growing.

Great interest is being manifested in the visit to Jefferson and Lewis Counties of the foreign delegates to the National Dairy Congress, after the close of the Congress. The delegates will be taken by auto tour from Syracuse to Utica, and from there North, making the first North Country stop at the certified milk farm of Dean H. E. Cook at Denmark. From here they will go to Carthage, inspecting the ice cream plant of the Dairymen's League Cooperative Association. Stops after that will be: F. K. Baumert's fancy cheese, milk sugar and casein manufactory at Antwerp; the limburg cheese cellars of A. Bickelhaupt at Redwood; the condensery of Libby, McNeil and Libby at Adams Center; the powdered milk plant of the Adams Dry Milk Company; and the big outfit of the Northern New York Milk Corporation, which is headed by Speaker of Assembly H. E. Machold. During the trip those taking part in it will be given an opportunity to see the Thousand Islands, and perhaps take a boat trip among them.

A. H. Adams is starting organization of the Junior Project work in Jefferson County for a new year. The windup of the old year was very successful—the girls' team in homemaking winning first place at the State Fair, the agricultural team getting third place, and the two girls in the home-making team getting first and second places in the tests for physical and mental fitness.—W. I. R.

For the second successive year the Wayne County Farm Bureau won first prize at the New York State Fair, scoring 94 points out of a possible 100. The display redounds much to Manager E. R. Wagner and C. H. Mills, of Sodus. There were 130 varieties of apples, 18 of pears, 16 of peaches, 32 of plums, 13 of grapes, 4 of cherries, 3 of quinces and 1 of garden or tame huckleberries. This last exhibit was supplementary to the fruit exhibit, being made by A. H. Pulver of Sodus.

Among the Farmers Of Pennsylvania and New Jersey

THE First State Standard Production Poultry Show in Pennsylvania will be held October 18, 19, and 20, at the Penn State College, under the auspices of the Penn State Poultry Club and the poultry department. This exhibit will be held in the spacious stock-judging pavilion on the college grounds.

The purpose of this show, the first of its kind in Pennsylvania, is to offer the poultry producers of the State an opportunity to place their birds in competition for egg and meat production.

Professor Roy E. Jones, extension poultryman of Connecticut Agricultural College, will judge all birds.

Good Transportation Assured

The Show Management has arranged with the Express Company for special baggage cars to transfer the birds to and from State College. This will insure a quick and safe journey for all birds.

The entry fee will be \$.25 for each single entry and \$1 for pen entries, the latter consisting of one male and four females. For the cash prizes, the entry fee will be pooled and awarded as follows: 50 per cent for first prize, 30 per cent for second, and 20 per cent for third prize of the total entry fee in the respective classes. In addition, first, second, third, fourth, and fifth prize ribbons will be given.

Many Varieties Eligible

In the standard egg production class the following varieties will be represented: Barred and White Plymouth Rocks, White Wyandottes, Single and Rose Comb Rhode Island Reds, Single Comb White, Single Comb Brown, and Single Comb Black Leghorns, Single Comb Black Minorcas and Single Comb Mottled Anconas. In the standard meat production class, Light Brahmas, Black Langshans, and Jersey Black Giants will be shown. There will also be a class for capons of any variety.

The classes in egg and meat production will consist of cock, cockerel hen, pullet, old pen, and young pen. In the case of capons only single entries will be exhibited.

Will Stage Auction Sale

A public sale of twenty or more of the best cockerels bred on the College Poultry Plant is an added attraction. All the birds come from very high producing stock and should make excellent breeders. If you cannot be present to buy one or more of these fine cockerels, send in a sealed bid to the secretary.

A large number of special prizes will be offered for best displays, best females, and largest number of entries. Huntingdon County is making a strong bid for the beautiful silver cup given to the county scoring the highest number of points in the show. They have promised to enter 150 birds.—L. T.

CENTRAL PENNSYLVANIA NOTES

J. N. GLOVER

Silo filling is about done, October 4, and corn cutting is in full swing. Corn is a fair crop, but not likely up to last year, though some persons say it is. Potatoes are being lifted and are selling along about \$1 a bushel with a poor demand as persons are looking for lower prices, which are not likely to come.

Winter apples are being picked and the crop is a good one for an off year. They sell from 30 cents to \$1 per bushel, according to the kind and the buyer. Wheat seeding is nearly done, except the silo corn ground which is being seeded as the soil can be fitted for a good seed bed. Very little clover seed or second crop hay can or will be made, as nearly all grass fields had to be pastured and pastures are short generally.

The Strickler-Kauffman farm in West Buffalo Township, Union County, of 147 acres, was sold at public sale for \$16,100 to Thomas McCreary. It cost Mr. Strickler \$11,000 a few years ago and he spent at least \$16,000 on it in improvements, making it the most complete and up-to-date set of buildings in that township. It has a brick

house on it, a number of acres in alfalfa and a large hog pen, with all other necessary buildings in good shape.

EASTERN PENNSYLVANIA NOTES

O. D. SCHOCK

Potato growers report varying results from certified potatoes purchased in widely separated potato growing districts. A consensus of reports gives Michigan grown seed stock as leading in quantity and quality of production. Russet varieties giving the largest yield. The eastern Pennsylvania growers in many instances had their best results from home-grown seed.

Lancaster tobacco growers cut and housed this season's crop without any loss or damage from early frost. The crop in its entirety is of fair yield and quality, also some localities fell far short as a result of the long-protracted drought.

NEW JERSEY FARM ORGANIZATIONS MEET ON LEGISLATION

Joint action to secure a new cooperative marketing law in New Jersey was approved by representatives of all important farm organizations and institutions of the State, at a legislative conference of organized agricultural groups under the leadership of the New Jersey Federation of County Boards of Agriculture and the New Jersey State Grange, held in Trenton on September 21. The decision followed a spirited discussion on the legislative needs of farmers in New Jersey, with President H. E. Taylor of the New Jersey Federation as presiding officer.

To Revise Hunting and Trespass Laws

A committee composed of official representatives of the New Jersey Federation of County Boards of Agriculture was also appointed to confer with the sportsmen's associations of New Jersey for an understanding on matters at issue with public interests in the hunting and trespassing laws.

The chief work outlined for this committee centers around the consideration of the open season for deer in the southern New Jersey counties, the posting of land against trespass and the penalty for wilful violations, the privilege of farm owners to allow their dogs to run at liberty in the fields and woods on their own farms during any season of the year, and a closed season for pheasant and quail in areas badly infected with the Japanese beetle.

Daylight Saving Gets Airing

Daylight saving time also came up for an airing. The confusion throughout the agricultural districts of the State and in certain city industries, reported at the conference, resulted in action by the farmers for a law this coming season which would make standard time the official time in all municipalities throughout the State.

The agricultural groups will renew their efforts this year to secure the passage of such amendments to the motor vehicle laws as will allow the carrying of farm products and milk in passenger cars without the necessity of a commercial license. Other changes proposed in this connection would regulate the use of auto or motor truck trailers.

Another legislative proposal at the joint conference would make the Board of Health rules for milk uniform throughout the State, these in line with suggestions from the milk counties in northern and central New Jersey and similar to a measure well advanced in the Legislature last year.

MILK FIGHT ON IN WASHINGTON, D. C.

A milk strike of considerable size is now on between the Maryland and Virginia Milk Producers' Association and the milk dealers of Washington, D. C. The producers have already raised more than one hundred thousand dollars to establish distributing facilities in the city of Washington and thereby win their fight against the dealers.

WANTED—Buyers for New York State farms. Interesting pamphlet of facts and list free. O. F. LAKE, Tully, N. Y.

Dairying As They Did It in Father's Time

(Continued from page 247)

while up on the Meredith hills the great Meridale Farms was filling silo by horsepower. "So the world do move."

Perhaps it may surprise us that the total number of cows in New York State has not greatly increased in fifty years, but our present dairies are better individuals to begin with and far more liberally and wisely fed.

There is no more interesting phase of our dairying than the cheese industry. Cheesemaking is a very ancient art and especially in Europe there has been developed a wonderful variety of cheese of all kinds and characters—cream, and whole-milk, and skimmilk, and soft and hard. In America, as elsewhere, where cheesemaking was long an individual farm proposition of no very great commercial importance. A new era was inaugurated when, in 1851, Jesse Williams began the manufacture of cheese in a central plant, taking in the milk of his six sons who operated neighboring farms. I remember passing the site of this first cheese factory. It was a few miles north of Rome, in Oneida County. A great spring of water wells up beside the road and the rymthical thud, as a hydraulic ram, throbs on the air.

Jesse Williams ought not to be omitted from the roll of men who were makers of history for this humble cheesemaker was the pioneer of a new system that went far. The factory idea spread with amazing rapidity so that by 1870 the census reported 1,313 cheese factories in the United States. These early cheese factories were, in many cases, very primitive structures, often unpainted and with very simple apparatus. It needed only a scales, two or three large cheese vats, heated by steam or even directly by a flue and fire, a curd rake or two, a curd mill, a press, a few simple supplies and a curing room. The latter was usually located on the second story and it was hot in summer and frigid in winter, but "skipper"-haunted at all seasons. In the early days cheese factories ran only seven or eight months a year on account of the small supply of winter milk and also because of the difficulties of manufacturing and curing in cold weather. Even yet the cheese country as a whole has stuck to summer dairying. The history of the rise and decline (I will not say the "fall") of the cheese industry in our State has in it many of the elements that make for romance. In certain counties of the State it had a palmy career. Little Falls, Utica, Water-

town, and Gouverneur had well-known boards of trade which served as a sort of auction mart for marketing, and in the export days it was boasted that the price paid on the Little Falls "Board" largely determined the price at Liverpool.

New York was once fortunate in having a man who was twice elected Governor, serving his second term during the strenuous days of the Civil War. In addition he was once the Democratic candidate for the Presidency, being defeated by Grant in 1868 by a comparatively narrow margin. He was withal a man of singularly lofty conception of public service, and I doubt if we ever had a citizen who was a better example of a patriot, a scholar, and a devout Christian gentleman. I refer to Horatio Seymour. A man of considerable personal wealth, he maintained a beautiful farm at Deerfield, just out of Utica, and his interest in agriculture was very sincere and his knowledge of dairying was wide. He was actively interested in the still famous Utica Farmers' Club, was president of the old National Dairy Association, and for many years was a popular speaker on agricultural topics. In addition he possessed the grace of being anxious to learn. Only a mile from my home is the fine old Angle Farm that for a century, and until recent years, had been the seat of the family of that name. My father used to tell me that this was the first farm in all this section of country to maintain a really large dairy—forty or more cows. The wife and mother was a pioneer cheesemaker as well as a woman of unusual intelligence and character. One day, about sixty years ago, a traveling carriage stopped at her gate and from it alighted no less a personage than the great statesman, Horatio Seymour, who had heard of her fame as a cheesemaker and had come to confer with her as to her methods. So for an hour this farm woman and this famous man discussed the problems of their common art. It is needless to add that Mrs. Angle never forgot or grew tired of repeating the story of that great day.

While writing of Horatio Seymour I would ask leave to set down one more anecdote concerning him, although it has no connection with dairy husbandry.

Every student of American history will remember the Cherry Valley Massacre which took place on November

ROLL DEVELOPED—Six post cards, 25c. Trial enlargement 5x7, 10c. Prints, 3c. COMMERCIAL STUDIO, Carthage, Missouri.

The Broad Highway—By Jeffery Farnol

"HUMPH!" said the red-headed man, "they say as he's wonderful quick an' can hit—like a sledge-hammer."

"Quick wi' 'is 'ands 'e may be, an' able to give a goodish thump, but as for beatin' me—I could put 'im to sleep any time an' anywhere, an' I'd like—ah! I'd like to see the chap as says contrary!" And here the pugilist scowled round upon his hearers.

"You always was so fiery, Tom!" purred the one-eyed man.

"I were," cried the prizefighter, working himself into another rage, "ah! an' I'm proud of it. I'd give any man ten shillin' as could stand up to me for ten minutes."

"Ten shillings!" said I to myself, "ten shillings, when one comes to think of it, is a very handsome sum."

"Wish I may die!" roared Cragg, smiting his fist down on the table again, "a guinea—a golden guinea to the man as could stand on 'is pins an' fight me for five minutes."

"A guinea," said I to myself, "is a fortune!" And, setting down my empty tankard, I crossed the room and touched Cragg upon the shoulder.

"I will fight you," said I, "for a guinea."

Now, as the fellow's eyes met mine, he rose up out of his chair and his mouth opened slowly, but he spoke no word, backing from me until he was stayed by the table, where he stood, staring at me. And once again there fell a silence, in which I heard the tick of the clock in the corner and the crackle of the logs upon the hearth.

"You?" said he, recovering himself with an effort, "you?" and, as he spoke, I saw his left eyelid twitch suddenly.

"Exactly," I answered, "I think I can stand up to even you—for five minutes." Now, as I spoke, he winked at me again. That it was meant for me was certain, seeing that his back was towards the others, though what he intended to convey I could form no idea, so I assumed as confident an air as possible and waited. Hereupon the one-eyed man broke into a sudden raucous laugh.

"'Ark to 'im, lads," he cried, pointing to me with the stem of his pipe, "'e be a fine un to stand up to Tom Cragg—I don't think."

"TELL 'un to go an' larn hisself to grow whiskers fust!" cried a second.

"I am willing," said I, "to accept your conditions and fight you—for a guinea—or any other man here for that matter, except the humorous gentleman with the watery eye, who can name his own price." The fellow in question stared at me, glanced slowly round, and, sitting down, buried his face in his tankard.

"Come, Tom Cragg," said I, "a while ago you seemed very anxious for a man to fight; well—I'm your man," and with the words I stripped off my coat and laid it across a chair-back.

This apparent willingness on my part was but a cloak for my real feelings, for I will not disguise the fact that the prospect was anything but agreeable; indeed my heart was thumping in a most unpleasant manner, and my tongue and lips had become strangely parched and dry, as I fronted Cragg.

Truly, he looked dangerous enough, with his beetling brow, his great depth of chest, and massive shoulders; and the possibility of a black eye or so, and general pounding from the fellow's knotted fists, was daunting in the extreme. Still, the chance of earning a guinea, even under such conditions, was not to be lightly thrown away; therefore I folded my arms and waited with as much resolution as I could.

"Sir," said Cragg, speaking in a very altered tone, "sir, you seem uncommon—eager for it."

"I shall be glad to get it over," said I.

"If," he went on slowly, "if I said anything against—you know who, I'm sorry for it—me 'aving the greatest respect for—you know who—you understand me, I think." And herewith he winked, three separate and distinct times.

"No, I don't understand you in the least," said I, "nor do I think it at all necessary; all that I care about is the guinea in question."

"Come, Tom," cried one of the company, "knock 'is 'ead off."

"Ay, Tom—cut your gab an' finish 'im," and here came the clatter of chairs as the company rose.

"Can't be done," said Cragg, shaking his head, "leastways—not 'ere."

"I'm not particular," said I, "if you prefer, we might manage it very well in the stable with a couple of lanthorns."

"The barn would be the very place," suggested the landlord, bustling eagerly forward and wiping his hands on his apron, "the very place—plenty of room and nice and soft to fall on. If you would only put off your fightin' till to-morrow, we might cry it through the villages; 't would be a big draw. Ecod! we might make a purse o' twenty pound—if you only would!"

"To-morrow I hope to be a good distance from here," said I; "come, show us your barn." So the landlord called for lanthorns and led the way to a large outbuilding back of the inn, into which we all trooped.

"If Tom Cragg is ready," said I, turning up the wristbands of my shirt, "why, so am I." Here it was found to every one's surprise, and mine in particular, that Tom Cragg was not in the barn. Surprise gave place to noisy astonishment when, after much running to and fro, it was further learned that he had vanished altogether. Tom was gone as completely as though he had melted into thin air, and with him all my hopes of winning the guinea and a comfortable bed.

It was with all my old dejection upon me, therefore, that I returned to the tap-room, and, refusing the officious aid of the One-Eyed Man, put on my coat, readjusted my knapsack and crossed to the door. On the threshold I paused, and looked back.

"If," said I, glancing round the ring of faces, "if there is any man here who is at all willing to fight for a guinea, ten shillings, or even five, I should be very glad of the chance to earn it." But, seeing how each, wilfully avoiding my eye, held his peace, I sighed, and turning my back upon them, set off along the darkening road.

CHAPTER VII

OF THE FURTHER PUZZLING BEHAVIOR OF TOM CRAGG, THE PUGILIST

EVENING had fallen, and I walked along in no very happy frame of mind, the more so, as the rising wind and flying wrack of clouds above (through which a watery moon had peeped at fitful intervals) seemed to presage a wild night. It needed but this to make my misery the more complete, for, as far as I could tell, if I slept at all (and I was already very weary), it must, of necessity, be beneath some hedge or tree.

As I approached the brow of the hill, I suddenly remembered that I must once more pass the gibbet, and began to strain my eyes for it. Presently I spied it, and instinctively I quickened my stride.

I was almost abreast of it when a figure rose from beneath it and slouched into the road to meet me. I stopped there and then, and grasping my heavy staff waited its approach.

"Be that you, sir?" said a voice, and I recognized the voice of Tom Cragg.

"What are you doing—and there of all places?"

"Oh—I ain't afeared of 'im," answered Cragg, jerking his thumb towards the gibbet, "I ain't afeared o' none as ever drawed breath—dead or livin'—except it be 'is 'Ighness the Prince Regent."

"And what do you want with me?"

"I 'opes as theer's no offence, my lord," said he, knocking his forehead, and speaking in a tone that was a strange mixture of would-be comradeship and cringing servility. "Cragg is

my name, an' craggy 's my natur', but I know when I'm beat. I knowed ye as soon as I laid my 'peepers' on ye, an' if I said as it were a foul, why, when a man 's in 'is cups, d' ye see, 'e 's apt to shoot rayther wide o' the gospel, d' ye see, an' there was no offence, my lord, strike me blind! I know you, an' you know me."

"But I don't know you," said I, "and, for that matter, neither do you know me."

"W'y, you ain't got no whiskers, my lord—leastways, not with you now, but—"

"And what the devil has that got to do with it?" said I angrily.

"Disguises, p'raps!" said the fellow, with a sly leer, "arter that theer kidnappin'—an' me 'avin' laid out Sir Jarsper Trent, in Wych Street, accordin' to your orders, my lord, the Prince give me word to clear out—cut an' run for it, till it blow'd over; an' I thought, p'raps, knowin' as you an' 'im 'ad 'ad words, I thought as you 'ad too."

"And I think that you are manifestly drunk," said I, "if you still wish to fight, for any sum, put up your hands; if not, get out of my road." The craggy one stepped aside, somewhat hastily, removed his hat and stood scratching his bullet-head as one in sore perplexity.

"I seen a many rum goes in my time," said he, "but I never see so rummy a go as this 'ere—strike me dead!"

So I left him, and strode on down the hill. As I went, the moon shot out a feeble ray, and, looking back, I saw him standing where I had left him, still staring after me down the hill.

NOW, though the whole attitude and behavior of the fellow was puzzling to no small degree, my mind was too full of my own concerns to give much thought to him—indeed, scarce was he out of my sight but I forgot him altogether; for, what with my weariness, the long, dark road before and behind me, and my empty pockets, I became a prey to great dejection. So much so that I presently sank wearily beside the way, and, resting my chin in my hands, sat there, miserably enough, watching the night deepen about me.

I was thus engaged when I heard the creak of wheels, and the pleasant rhythmic jingle of harness on the dark hill above, and, in a little while, a great wagon or wain, piled high with hay, hove into view, the driver of which rolled loosely in his seat with every jolt of the wheels, so that it was a wonder he did not roll off altogether. As he came level with me I hailed him loudly, whereupon he started erect and brought his horses to a stand:

"Hulloa!" he bellowed, in the loud, strident tone of one rudely awakened, "w'at do 'ee want wi' I?"

"A lift," I answered, "will you give a tired fellow a lift on his way?"

"W'y—I dunno—be you a talkin' chap?"

"I don't think so," said I.

"Because, if you be a talkin' chap, I beant a-goin' to give 'ee a lift, no'ow—not if I knows it; give a chap a lift, t' other day, I did—an' 'e talked me up 'ill an' down 'ill, 'e did—dang me! if I could get a wink o' sleep all the way to Tombridge."

"I am generally a very silent chap," said I; "besides, I am too tired and sleepy to talk, even if I wished—"

"Sleepy," yawned the man, "then up you get, my chap—I'm sleepy too—I alus am, Lord love ye! theer's nowt like sleep—up wi' you, my chap."

Forthwith, up I clambered, and, laying myself down among the fragrant hay, stretched out my tired limbs, and sighed. Never shall I forget the delicious sense of restfulness that stole over me as I lay there upon my back, listening to the creak of the wheels, the deliberate hoof-strokes of the horses, muffled in the thick dust of the road, and the gentle snore of the driver who had promptly fallen asleep again. On we went as if borne on air, so soft was my bed, now beneath the far-flung branches of trees, sometimes so low that I could have touched them with my hand, now, beneath a sky heavy with sombre masses of flying cloud or bright with the soft radiance

of the moon. And so, lulled by the gentle movement, by the sound of wheels and harness, and the whisper of the soft wind about me, I presently fell into a most blessed sleep.

CHAPTER VIII

WHICH CONCERNS ITSELF WITH A FARMER'S WHISKERS AND A WAISTCOAT

HOW long I slept I have no idea, but when I opened my eyes it was to find the moon shining down on me from a cloudless heaven; the wind also had died away; it seemed my early fears of a wild night were not to be fulfilled, and for this I was sufficiently grateful. Now as I lay, blinking up to the moon, I presently noticed that we had come to a standstill and I listened expectantly for the jingle of harness and creak of the wheels to recommence. "Strange!" said I to myself; I sat up and looked about me. The first object my eyes encountered was a haystack and, beyond that, another, with, a little to one side, a row of barns, and again beyond these, a great, rambling farmhouse. Evidently the wain had reached its destination, and the sleepy wagoner, forgetful of my presence, had tumbled off to bed. The which I

INTRODUCING THE HERO

PETER VIBART, disinherited, takes to the road to earn his own living, leaving his dissolute cousin, Sir Maurice Vibart, to win their uncle's fortune, if he can, by marrying Lady Sophia Sefton.

Peter, who tells the story, has never seen either of them, but from talk he hears at a wayside tavern, he gathers that his cousin is an expert boxer as well as a dandy. A professional pugilist, Tom Cragg, denies he was knocked out by Sir Maurice.

thought so excellent an example that I lay down again, and, drawing the loose hay over me, closed my eyes, and once more fell asleep.

My second awakening was gradual. I at first became conscious of a sound, rising and falling with a certain monotonous regularity, that my drowsy ears could make nothing of. Little by little, however, the sound developed itself into a somewhat mournful melody or refrain, chanted by a not unmusical voice. I yawned and, having stretched myself, sat up to look and listen. And the words of the song were these:

When a man, who muffins cries,
Cries not, when his father dies,
'T is a proof that he would rather
Have a muffin than his father.

The singer was a tall, strapping fellow with a good-tempered face, whose ruddy health was set off by a handsome pair of black whiskers. As I watched him, he laid aside the pitchfork he had been using, and approached the wagon, but, chancing to look up, his eye met mine, and he stopped:

"Hulloa!" he exclaimed, breaking short off in the middle of a note.

"Hullo!" said I.

"W'at be doin' up theer?"

"I was thinking," I returned, "that I, for one, could not blame the individual, mentioned in your song, for his passionate attachment to muffins. At this precise moment a muffin—or, say, five or six, would be highly acceptable."

"Be you partial to muffins, then?"

"Yes, indeed," said I, "more especially seeing I have not broken my fast since midday yesterday."

"Well, an' w'at be doin' in my hay?"

"I have been asleep," said I.

"Well, an' what business 'ave ye got a-sleepin' an' a-snorin' in my hay?"

"I was tired," said I, "still—I do not think I snored."

"Ow do I know that—or you, for that matter?" rejoined the farmer, stroking his glossy whiskers, "how's ever, if you be quite awake, come on down out o' my hay." As he said this he eyed me with rather a truculent air, likewise he clenched his fist. Thinking

A Wedding in Japan

As It Was Before the Earthquake—Fall Patterns

IN contrast to the reports of earthquake, fire and tidal wave, recently coming from Japan, is the account of a wedding ceremony witnessed by Miss Mary Miles, a Presbyterian missionary, which is described in a letter just received in this country. It also suggests the devastation which must have been wrought not only among the native homes and estates, but in the extensive and impressive buildings, largely educational, erected in Japan by the gift of Americans.

Miss Miles states that the wedding reception was at the home of Baron Iwasaki, said to be "the wealthiest man in Tokyo."

The groom, Mr. Sawada, employed in the Government foreign office, had been educated abroad and was of the Friends (Quaker) faith. The bride was also a Christian, so the Christian ceremony was used, at the groom's desire. There were ushers and eight bridesmaids, all attired in rose-colored kimonos, on which were painted symbolic designs depicting white clouds with golden linings, and flying storks holding in their beaks branches of pine. The bride wore the regulation ceremonial black kimono, which represented many years of exquisite handwork in gold and silver embroidery, and her black pompadour was adorned with diamond tiara and combs.

The bridal party and seventy invited guests were taken, after the church ceremony, in limousines to the estate of Baron Iwasaki, which has been in his family for generations and around which the city of Tokyo has grown up. Baron Iwasaki owns a huge foreign brick house, covering two and a half acres, furnished in a luxurious combination of Japanese and foreign architecture, with many costly paintings and some pieces of good sculpture in the house and grounds. The grounds comprise twenty-one acres of gardens, enclosed entirely by high brick and concrete walls, and laid out in typical Japanese style, with artificial mountains, lake and islands, connected by rustic or stone bridges.

In true Oriental style, the letter states, after the reception all of the guests received beautiful baskets of flowers and were conveyed back to their homes in modern limousines.

Church and school buildings erected by American gifts have been completely or largely destroyed. Most foreign mission stations include important hospital buildings, but there has not been the necessity for these in Japan, which has been very progressive in adopting

modern scientific medical work. However, in no country in the world has there been of late years such a strenuous demand for the best in education, and the missions have largely concentrated on erecting this type of buildings. Japan has thirty-three colleges for men, but up to 1918 had none for women. In that year the non-sectarian Woman's Christian College of Japan was started at Tokyo. Two hundred and five women from all parts of the empire immediately applied for admission, far exceeding the capacity of the single large wooden house which then constituted the college.

It had been expected that the college would move into its first set of new buildings, provided for by a joint fund raised by American and Canadian women interested in missions, on the day the disaster occurred.—E. E.

The Broad Highway

(Continued from page 255)

it wise to appear unconscious of this, I nodded affably, and letting myself down from the hay, was next moment standing beside him.

"Supposin' I was to thump 'ee on the nose?" he inquired.

"What for?"

"For makin' so free wi' my hay."

"Why then," said I, "I should earnestly endeavor to thump you on yours."

The farmer looked me slowly over from head to foot, with a dawning surprise.

"Thought you was a common tramp, I did," said he.

"Why, so I am," I answered, brushing the clinging hay from me.

"Trampers o' the road don't wear gentlemen's clothes—leastways, I never see one as did." Here his eyes wandered over me again, from my boots upward. Half-way up, they stopped, evidently arrested by my waistcoat, a flowered satin of the very latest cut.

"That be a mighty fine weskit, sir!"

"Do you think so?" said I.

"Ah, that I do—w'at might be the cost of a weskit the like o' that, now?"

"I paid forty shillings for it, in London, scarcely a week ago," I answered.

"Gammon!" said he.

"None the less, it's true," said I.

"Any man as would give forty shillin' for a garment as is no mortal good agen the cold—not reachin' fur enough, even if it do be silk, an' all worked wi' little flowers—is a dommed fool!"

"Assuredly!" said I, with a nod.

(To be continued)

FOR MOTHER, SON AND TINY DAUGHTER

No. 1775, rompers for the smallest one, whether girl or boy, is easy to make and very inexpensive. It comes in 1, 2, 4 and 6 year sizes. Size 4 requiring 1½ yards striped and ¾ yard plain 36-inch material. **Price 12c.**

No. 1859 is a smart dress for Mother. It slips on over the head, has long lines, the popular side pleats and a choice of flowing or close-fitted sleeves. No. 1859 cuts in sizes 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. Size 36 takes 3¾ yards 40-inch material and 4 yards binding. **Price 12c.**

No. 9442 is a standard boy's blouse, including two styles of collar, and a yoke which may or may not be used. It cuts in 4, 6, 8, 10 and 12-year sizes and requires 1¾ yards 36-inch material for size 8. **Price 12c.**

To Order: Be sure your name and address, pattern numbers and sizes, are clearly written. Enclose the correct amount in stamps or coin (wrap coins carefully; they are sent at your own risk) and send to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

Add 10 cents for the big fashion book—a dressmaking aid of the greatest value. It is the finest style catalogue we have ever published.

The Home Bureau at the State Fair

First Exhibits of Women's Work Meet With Complete Success

PERHAPS never in the history of the Home Bureau in New York State has its work been so favorably presented to the general public as during the recent State Fair in Syracuse. For the first time the State made it possible for ten of the counties to arrange exhibition booths, on the same basis guaranteed the Farm Bureaus for some years past.

The task of assembling displays was a new field for the various county managers, and for their memberships, but every man, woman and child who strayed through the "dome" building at the fair and saw the exhibits, said emphatically that they made good.

Chenango County won the first prize ribbon. Members of this Bureau, and Miss Adelaide Barts, manager, did not know until one week before the Fair that they were to exhibit. That did not dismay or discourage them, however, and a whirlwind campaign of assembling samples resulted in their capture of first prize. Perhaps the most prominent display in this attractive booth was a large table in the foreground, showing the food preservation project as recommended for one person for one year. The exhibit included the correct amount of garden

placards in the foreground of the Saratoga booth was the statement that the work aimed to have "Theodore Roosevelt's Dream Come True."

Original Features from Saratoga

This booth had so many original features that it is hard to select the most worthy. For one thing, the collection of jellies, jams, fruit juices, canned fruits, meats, and vegetables, also dried and candied fruits, has been selected to go to the New York Fruit Exposition in November. The exhibit will first be shown in one of the community houses in the home county for the benefit of the Saratoga Board of Supervisors. The display of the food preservation project, 210 cans in all, showed many original "kinks" such as the labels: "A Happy Choice of Sweets," "Fruit Juices for Fresh Winter Jellies," "Our Juniors Can Too," "Don't Forget—Two Fruits a Day," "Delicious Soups and Salads at a Moment's Notice," "For Economy and Convenience, Can Meats," and so on.

A complete jellymaking equipment was shown. Also two wheel service trays made by two young girls of the county, from old-fashioned washstands. These trays bore samples of jelly in

ing cooperative movements, field day events, rural dramatics, and Red Cross activities.

Miss Lucille Brewer, food preservation specialist, may take just pride in the work done in this county and its recognition by the Fair and the New York Show. It is one of the few counties in which pretty nearly the entire food project as outlined to date has been given.

Tompkins County won third place. Some of their food preservation exhibit was so good that it also was invited to the New York Exposition. In the corner occupied by this excellent exhibit was an old garden bench that the Fair officials had long had under foot. When the booth was complete, one of the men who thronged all these displays was heard to say: "See there! Those women have made use of that old bench we thought was junk."

Tompkins Has Trained Local Leaders

It is said that in the three years this county has been organized under the leadership of Miss Vera McRea, its accomplishments have, perhaps, surpassed those of any other county in the United States. Miss McRea has just resigned her position, to the great regret of a membership of over 1,000, in 42 communities of the county, to join the staff of the Dairymen's League Co-operative Association. One tribute to the far-seeing qualities of this leader is the introduction of the local leader idea in the work.

Otsego, Ontario, Oswego, and the other exhibiting counties followed in the list of awards.

As a first attempt the Home Bureau display was a real triumph. Most of the women put up their booths with their own hands. Some of the women wore dresses made in their clothing project through the week, as they interviewed the throngs that viewed their work. One group had on exhibit and others wore the "health" shoes they had adopted since taking the health projects.

On Friday the ten Home Bureaus represented gave a luncheon to Mrs. Burt Miller of Owego, whose services have been invaluable in making this exhibit possible. Mrs. A. E. Bridgen, President of the State Federation, was an honored guest on this occasion.

Among the really rural features of the Fair this year the Home Bureau booths easily led in interest. Men and women alike seemed to recognize its importance and vital influence on the farm home.—M. G. F.

Floor oil made of one part boiled linseed oil to three parts turpentine cleans and does not darken the floor.

An exhibit easy to see and understand

vegetables, both fresh and canned, as well as stored for winter; also the fruits recommended for health.

The display of canned fruits, jellies, fruit juices and vegetables was very interesting, and the array of beautiful one-piece dresses, waists and children's clothing, made by the members as a demonstration of the clothing projects of the county, was unequaled at the Fair.

Figures that Tell the Story

Striking posters and placards stated that 8 Home Bureau groups of the county had assisted in screening their schoolhouses, 7 had improved their school playgrounds, 3 village schools had given milk to the children in the forenoon, with the result that of 18 children who were underweight in October but 4 were underweight in May; 44 changes of housefurnishing; 24 homemakers learned to save time, steps and energy by changes in kitchen arrangement, equipment, or working heights; 6 Home Bureaus had put on plays at fairs; while the splendid fact was heralded that 90 per cent of the schools of that county had been induced to serve one hot dish per day.

Other features of this exhibit were samples of modern kitchen equipment, scales used in weighing children, and a model country schoolhouse, not to mention a framed copy of the beautiful Home Bureau creed, written by Ruby Green Smith, the gifted secretary of the State organization.

The Saratoga Home Bureau exhibit won the second place, though it was said to have found first place on a straw vote of the judges. Yet, after due consideration, the decision finally placed Saratoga in the second place.

This booth, as did many others, stressed the work in nutrition and health. Colonel Roosevelt was an admiring visitor on Tuesday, when he expressed the liveliest approbation and enthusiasm over the work. One of the

tiny glasses for a single serving for invalids or children. The caps on the glasses were unique, made of milk bottle caps, a collar button for a knob, fastened on with red sealing wax, the entire cap being coated in blue sealing wax. This display is also going to the New York Show.

Placards stated that there are 50 steam pressure cookers in use in the farm homes of Saratoga county and too many fireless cookers to make an accurate estimate. Besides a full line of handsome one-piece dresses, waists and skirts made by the women, there was a very attractive group of clothing made by the young girls of the county. One pink dress and bloomers, made by a 10-year-old girl, would have done credit to any experienced seamstress. Samples of patching, darning and hemming of fine quality were shown by a girl of eleven.

The Saratoga County Fair Association was one of the few in the State that couldn't see the advantage of home talent plays at the Fair as a means of competing by wholesome amusement with the usual gambling devices and cheap shows. But the Home Bureau this year, with the assistance of Mrs. Green of the college, put on six plays by as many communities. They hired their own orchestra and after the accounts were made up, presented the Fair with a nice sum to demonstrate that wholesome recreation holds a high place in the minds of the people.

Photography and Clipping Records

Another effective item was a real household account book, as kept by a farmer's wife, showing her system of budgeting and financing in detail.

The Saratoga County Scrap Book, Home Bureau news files, and "Pictorial Review" must not be omitted in an account of this work. For some time back a comprehensive historical and pictorial record has been kept of different lines of county activities, includ-

NEW LAMP BURNS 94% AIR

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

A Modern Bathroom, \$60

Just one of our wonderful bargains. Set comprises a 4, 4½ or 5 foot iron enameled roll rim bath tub, one 19 inch roll rim enameled flat-back lavatory, and a syphon action, wash-down water closet with porcelain tank and oak post hinge seat; all china, index faucets, nickel-plated traps, and all nickel-plated heavy fittings. Reviewing the Latest Eastern Markets and Prices

A CHAT WITH THE RAILWAY EXPRESSMAN

HERSCHEL H. JONES

"It is the small egg producer with from 50 to 150 hens who causes the most trouble in the market," said an official of the American Railway Express to me recently. "I wish I could talk personally with every such shipper and tell him what I have seen. Take, for instance, washed eggs. There are a lot of farmers who still persist in washing eggs before sending to market in spite of the fact that a dealer invariably detects washed eggs and discounts heavily on prices."

"The small shipper must ship everything to get a full case without regard to grade. He fails to give attention to the care of eggs and he holds them too long before shipping. He neglects to candle his eggs and has no information as to thin shells and other defects which will not permit his eggs to stand up under critical buying. Nevertheless, he imagines he is putting real goods in his case and is disappointed if he does not get the top prices."

"Of course, it is sometimes difficult to grade eggs properly, but there is no excuse for holding eggs too long. Held eggs, especially at this season, come in in abundance and they always bring

low prices. Moreover, many eggs have defects the farmer is unaware of unless he candles. In our recent Poultry Demonstration Tour on the Erie we candled many eggs and found a great many weak shelled. When we talked with the producers, we found that many were not feeding sufficient of, or the right materials."

In a word, the express company has found that it cannot stop its educational work with the packed eggs. It must go clear back to proper feeding of the flock. But egg losses are still enormous from poor packing.

"It is hard to believe that farmers will still pack in old second-hand fillers. If they could see, as I have seen, the

Shippers began to quote up to \$2.80 for sacks and \$1.80 cwt. in bulk.

Long Islands hit \$1 bu. and then traveled back to \$1.15 for the best South Side stock. Most of the growers have been storing and have practically finished digging.

The market in New York City has been extremely dull and the buyers have been having everything their own way.

CHEESE MARKET FIRM

The market on State cheese remained firm during the week due to high costs up State. The competition of buyers in New York and Wisconsin has tended to hold prices steady. Weather conditions have become favorable and Wisconsin

grades was generally weak under heavy supplies. Good small veals brought on October 4, 12 to 14c while fancy sold as high as 22c.

Live calves brought as high as \$15.50 during the week under a market that varied from steady to slow. The demands for lambs generally remained steady. On October 4, five cars were sold at prices ranging from \$13 to \$14.50.

Harvesting Potatoes

(Continued from page 250)

are ruled out of U. S. No. 1 Grade. Whether a tuber is to be classed as misshapen in determining how to grade must, of course, be decided by the grower's best judgment. However, all pointed or dumb-bell shaped tubers found in such types as Rurals and Green Mountains should be removed. Tubers with either surface or internal cuts are also taboo, the latter being especially undesirable since they result in much internal dry rot by the time tubers so injured have reached the consumer. Although hollow-heart is most commonly associated with large tubers, size is no criterion of this defect. Every shipper should sample his crop for hollow-heart by cutting tubers selected at random from various parts of his field or bin. This will enable him to judge whether his crop is likely to qualify as to grade.

SHEEPSKIN COATS

For MEN \$9⁷⁵
For BOYS \$7⁸⁵

DIRECT FROM MAKER

THE right cold weather coat for men and boys—direct from manufacturer at a big saving! A full-cut, 36-inch length. loss to the shipper from such fillers, they would never use anything but new flats and fillers. Yet just recently, I have seen many cases with the fillers dirty, and stained, and broken down. The finest eggs, packed in such cases, will never bring the prices they should."

APPLE SUPPLIES HEAVY

The New York market was heavily supplied with apples last week and prices were low except for very fancy stock. Poor and average qualities of barrel and basket apples were neglected and the market for them demoralized. It was difficult to move them, even at low figures. Only fancy large McIntosh and Greenings were scarce and in demand. Boxed apple shipments were heavy and many buyers turned to them instead of barrels.

Western New York shipped quite a number of cars of both barreled and baskets to New York; Vermont shipments increased.

The bulk of Hudson River and State shipments were of ordinary quality and not desirable for storage, on which it is impossible to give representative quotations. Some small sizes of B and unclassified Hubbards sold as low as \$2.45 bbl. A Grade McIntosh, 2¾-inch up, sold at \$7.50, and even \$8 bbl. Large A Greenings sold as high as \$7 to \$7.25 bbl., but mostly around \$6.50.

CABBAGE MARKET WEAK

Due to heavy supplies at most of the loading points in New York State, the price of cabbage has steadily declined. Early last week, some cars of kraut cabbage sold for \$18 per ton f.o.b. Friday, shippers were quoting freely at \$14 and the buyers were holding off. Grocery stock was offered at \$16.

POTATO MARKET STRONGER

After selling down to \$2.50 per 150-lb. sack delivered New York City points in carlots, potatoes from both Maine and New York found a better demand toward the end of last week.

reports a larger production. On October 4, fresh fancy State flats brought 28 cents and average run 27 to 27½c.

BUTTER MARKET STEADY

The market for butter in New York City, which held steady during the week, became firmer under the influence of the sharp advance in Chicago. On October 4 creamery extras brought 47c and firsts, 45 to 46½c. Imports of foreign butter during the month of September were over 800,000 pounds. Last year, on the other hand, there were no imports of butter to the United States during any of the three months of August, September or October.

POULTRY TRADING ERRATIC

Prices on express shipments of poultry fluctuated greatly during the week, running to as high as 34c on Friday, September 28, dropping under a slack demand on the first of the following week and strengthening to 30c again on Thursday, October 4, for colored fowls. Chickens continued to meet a dull market.

CASH GRAIN QUOTATIONS

Cash grain quotations on October 5 were as follows:

NEW YORK: WHEAT—No. 2 red, \$1.24. CORN—No. 2 yellow, \$1.19½; No. 2 mixed, \$1.18½; No. 2 white, \$1.19½. OATS—No. 2 white, 54c; No. 3 white, 52½ to 53c; ordinary, white clipped, 56 to 57c. RYE—80½c. BARLEY—78 to 80½c.

CHICAGO: WHEAT—No. 2 red, \$1.09½ to 1.10. CORN—No. 2 white, \$1 to 1.00½; No. 2 yellow, \$1 to 1.01. OATS—No. 2 white, 43½ to 45½c; No. 3 white, 42½ to 43½c. RYE—73¾c. BARLEY—60½ to 75c.

CHEAPER HAY IN DEMAND

Buyers demanded a cheap feeding hay during the week and No. 3 was easier to sell than the better grades. Prices advanced two dollars per ton on No. 3, which sold on October 4 at \$25 to \$27 per ton.

MEDIUM VEALS OVERSTOCKED

Outside of a good demand for fancy-dressed veals the market on medium

SALE OF State Ditching Machines

Notice is hereby given that I, Berne A. Pyrkke, Commissioner of Farms and Markets, by virtue of the power and authority conferred on me as such by provision contained in Chapter No. 729, Laws of 1923, will sell to the highest bidder the following farm machinery, now the property of the State of New York; to wit:

One Buckeye Tractor Power Ditching Machine No. 1820 now located at Williamson, Wayne County, N. Y., which machine can be seen in operation at that place October 15 and 16, 1923; one Buckeye Tractor Power Ditching Machine No. 1825 now located at Savannah, Wayne County, N. Y., which machine can be seen in operation at that place October 24 and 25, 1923; one Buckeye Tractor Power Ditching Machine No. 1827 now located at Dundee, Yates County, N. Y., which can be seen in operation at that place on October 30 and 31, 1923; and one Buckeye Tractor Power Ditching Machine No. 1834 now located at Castile, Wyoming County, N. Y., which can be seen in operation at that place November 5 and 6, 1923.

These machines have been thoroughly overhauled. They are and each of them is equipped with No. 3 Motor, automatic, heavy duty, gasoline, four-cylinder engine; dirt chute and dirt conveyor for extra deep cuts; armored cleaner shoe to prevent dirt rattling into trench while machine is in operation. These machines are built to cut trench 15 inches to 20 inches in width, and up to 5½ feet in depth, to a perfect grade, in one operation, at the rate of 1½ to 10 feet per minute.

Scaled bids for one or more of the above named machines will be received by the Commissioner of Farms and Markets at the office of the State Department of Farms and Markets, City of Albany, County of Albany, State of New York on or before September 28, 1923, and within five days from the last demonstration date as set forth for each machine.

For further information regarding machines or the demonstration or sale thereof, address the Commissioner of Farms and Markets, Department of Farms and Markets, Albany, N. Y.

BERNE A. PYRKKE,
Commissioner of Farms and Markets.

Dated at Albany, N. Y., this
1st day of October, 1923.

Dairying As They Did It in Father's Time

(Continued from page 254)

11 (Armistice Day), 1778. It practically wiped out the community, but after the enemy had left, the survivors returned and buried some forty murdered settlers in one common grave. It is one of the darkest and saddest tales in all the long story of American history. A hundred years later a monument was erected commemorative of the event and of those who died. When this monument was dedicated a vast concourse of people were gathered to hear Horatio Seymour deliver the memorial oration. 'I, too, was there—a little lad of seven years old—and we pressed up close to the speakers' stand and they lifted me up so that I might see and remember the great man. Of course I have forgotten almost everything he said, but one single sentence still stands out across the years with cameo-like distinctness. I am sure I remember the identical phrase. He spoke of the horrors and sufferings of those years and the price our fathers paid for the blessings of freedom that we enjoy and then he paid his respects to those who would dishonor the fair name of America by "Sabbath desecration and lager-beer drinking." Seymour was a man of wide attainments, scholarship and culture, but ethically he had still the viewpoint of the New England Puritan stock from which he sprang. In these days, when men in authority refuse to aid the Federal Government in the enforcement of the Eighteenth Amendment and pass enactments which permit (as only last week in our chief city) two human brutes to engage in a contest worthy of the degenerate days of old Rome, I, for one, would be glad if we might again have a righteous statesman-farmer keeping watch on Capitol Hill.

Sometime, if you go into the lobby of Baggs' Hotel, at Utica, you may see there, done in oil, the portrait of this old-time worthy, and also of Roscoe Conklin—without debate, Oneida County's two most illustrious sons. They belonged to rival political parties, they were temperamentally exceedingly different, but they were warm friends and good men, each according to his light. But I started to write of dairying and not of biography.

I had intended to write of the evolution of buttermaking—of the shallow pans of our grandmothers—of the large rectangular pans that came in a little later—of deep settings and the Cooléy Creamer and the Aquatic Separator (what a monumental fraud this last was!)—of the coming of the first centrifugal separator, in about 1877, and then the rise of the butter factory system. But all this would mean a book and not an article, so I shall say in Kipling's phrase, "But that is another story."

Also, if it were possible, I would like to pay fitting tribute to that fine group of dairymen who founded the early New York State Dairymen's Association, but most of them have "fallen on sleep" and the task is too great for me.

"The old order changeth, giving place to new," but the business of dairying still remains. We are familiar with many things concerning which an earlier generation never dreamed, yet sometimes I ask myself if all the inventions and science have really made us any happier or more contented, or more righteous than our fathers were.

Dad's Secretary!

NO longer are business letters, purchase orders, and farm reports classed among the chores. Ever since Dad got the Underwood Portable, Mary has been taking a load of trouble off his shoulders.

Dad just "thinks out loud", and Mary's quick wits and nimble fingers do the rest. The Portable enables her to put words and figures on paper in a way that is rapid, clear, and businesslike. And she keeps on file a carbon copy of everything she writes.

Dad's reputation as a good business man has grown as a result of all his letters being typewritten. Business men instinctively respect others who are up-to-date and business-like in their methods.

No one needs to go to business college to learn to operate the Underwood Portable. The knack is easily acquired, with the aid of the instruction booklet that comes with every machine. Young folks who gain at home a knowledge of typewriting have a valuable asset whatever their life work may be.

"Where Do We Go From Here"

How a Banker Views Farmers' Problems

A WEA and American Agriculturist Wednesday Evening Radio Talk

I HAVE been asked, as a banker, to talk about farming. Just how competent bankers are to discuss this subject may be open to question, but so often have I heard farmers—and others—express their opinion of bankers, that I could not resist a chance to get even. And if I can raise any interest in farming by talking about it—well, some will say that raising interest is my business.

What I have to say, though addressed primarily to the farmers of New York State, may apply with equal force to farmers in many sections adjacent to metropolitan centers. The food problem is perhaps the knot-tiest in all economics. No field of business offers a bigger and more promising opportunity for organization than this. Agriculture is the oldest industry; in many ways it is also the most conservative, the slowest to come into line with the present financial organization of society. The farmer is an individualist. Farms are owned and run by individuals, not by corporations. It follows, therefore, that the management does not have the benefit of the collective judgment of a board of directors. The farmer, so to speak, is the whole show. And he is a busy man. Is it to be wondered that he does not find time to become a specialist in marketing as well as in production?

The distribution of food is a disorganized and wasteful business; that is how it looks to bankers. The money we have to loan is not ours; it is the money of our depositors. To safeguard their interests, we must have security for our loans. Now, which is the better security, a carload of apples from Oregon, all neatly packed, graded, labeled, all uniform in size and quality, bearing the name of a brand which consumers have been educated to know and like, or a carload of apples from somewhere in New York State, badly packed, ungraded, unlabeled and widely varying in size and quality? In taste and food value the two carloads might be very similar. But in money values, the standardized western product is an incomparably better security for the bankers' loan. New York City banks have no predilection for the financing of fruit from the Pacific Coast. It would be more feasible to lend on foods nearer home if the eastern farmer would apply knowledge, intelligence and cooperative effort to the task in hand as his western rivals have done.

Cooperation in marketing the products of agriculture should be fostered, not only among larger groups, as represented by the prominent State associations, but particularly in sections and communities. Cooperative plans may well include purchasing and expert service as well as selling. I venture to say, there is scarcely a single region where

By WILLIS G. NASH

President, New York State Bankers' Association, Vice President, Irving Bank-Columbia Trust Co., N. Y.

the farmers plan their crops and deliveries with special reference to the consumer demand of that region, simply because there is no organization, no intelligent research, no exact information and system. Guess work, lack of precise knowledge, assumptions not verified by research and analysis, and such slipshod business methods are beyond question responsible for more waste and loss in trade, commerce and industry than anything else; and this neglect of economics is just as unfortunate among farmers.

investment is anywhere near as large. Only a small percentage of the State's farmers receive adequate information or service from the Department of Agriculture. Only a small percentage of our cultivated acres are tilled according to the science of maximum crop security and maximum crop returns.

I know that incalculable benefits would follow an aggressive, business-like campaign of publicity that would bring home to the minds of the New York farmers an understanding of the profitableness and security of modern methods of production and faith in them. Modern methods, of course, mean more than machinery. We lead the world in the use of agricultural machinery, but machinery is only one side of the production problem. When it comes to coordinating the other modern and scientific factors, such as the study of soils, of animal heredity, we must put the available knowledge in workable form before the individual farmer in such a way that he guides his activities thereby.

A friend of mine once said that the farmer's life was best described by seven W's: Work, Weather, Weeds, Worms, Waste, Wages and Worry. Unless means are found to remedy this, the farmer, by tens of thousands, is going to quit his thankless battle for a decent security of living and an economic square deal, and that spells economic unbalance, tension, trouble, loss and needless hardship in the

complicated structure of society. The time for talking is long past. What is needed to-day is action.

New York ranks fifth among the States of the Union in the value of its agricultural products. New York's commercial and industrial undertakings are well coordinated with its banking, but there is an opportunity for the banker to encourage, assist and cooperate in the much greater development of agricultural wealth.

The subject of increasing and securing the farmer's profits, and of cheaper food for the city dweller assured by more economical methods of distribution, has been discussed for years in glittering generalities and sonorous platform phrases, but little progress has been made beyond the talking stage. Certain bald facts remain after the smoke of political speeches has cleared away. Food prices are excessively high in the cities; farmers are having a hard time to make both ends meet, and thousands of farmers are discouraged to the quitting point by their struggle to get and keep labor and to continue their fight for sustenance.

Let me tell you about a plan which has been set before the Governor of New York State. This is to vest in the State Department of Agriculture the authority (supported

(Continued on page 270)

Some scientists claim the Japanese people are of small stature because they have never used dairy products. If that is so, it will not be true in the future. These delegates from the land of cherry blossoms to the World's Dairy Congress at Syracuse show that Japan is becoming a cow country

In every sizable town and every city, farmer-owned-and-operated stores, depots and markets should be established. There is no reason why the same organization should not deal in feeds, fertilizers, machinery and supplies for its members, and thus make money going and coming. The sell-at-wholesale-buy-at-retail business methods of the overwhelming majority of farmers have absolutely nothing to commend them or justify their long existence among intelligent, educated men. Sound, reasonable, economic methods need only energetic leadership of a kind which commands general community confidence—why not the local bankers?

Marketing is by no means the only aspect of the subject where systematic group action by the farmers themselves can bring about a profitable result. Production itself needs the results of pooled experience. Few farmers produce crop and animal husbandry results which approximate first-class attainable practice. A great number of the State's million and a half dairy cows do not pay. Preventable animal diseases sweep away millions of dollars in profits every year. New York's average acre yields of the great grass, grain, root, vegetable and fruit crops are far below the standards of good practice. The average farmer's income is much less than that of the town or city business man whose

Paths of Promise Not Always Cityward

An Experiment in Teaching City Boys Country Ways

MANY a country boy dreams of the things of the city—its massive buildings, its great factories, its banks and busy marts of trade, and its teeming people on business or pleasure bent. His heart grows warm and his eyes grow bright as he paints a picture of these things with himself the central and controlling figure in the years to come. Often his dreams come true. The world has use in its schools and churches and in its counting houses and factories for the country boy. And it is both the undeniable right of childhood and the indispensable attribute of a life well lived to dream dreams.

But the city boy has his rare moments too, when he lives in another world. He fills it with trees, and birds and green grass, and open spaces, and cows and kindred things. That is, some city boys do. And he wonders if his dreams may not also come true.

We say that in America, one may choose the life he wishes to live and the thing he desires to do without let or hindrance, so long as he does not encroach upon or place in jeopardy the inherent rights and liberties of other men. We mean that this shall always be so. But one of the greatest problems facing us, especially those dealing with the youth of America through the medium of the school, is to make it possible for a boy to arrive at a fair estimate of what he really wishes to do, the decision to be based on real facts and a real acquaintance with the field in which he thinks his happiness lies.

How many a city boy determined in some definite measure whether or not the end of his rainbow of promise lies in the open country, and do it soon enough to shape his activities in that direction? If he finds that his desire rings true on the anvil of actual contact with things of the country, then well and good; he has passed a milestone in the journey of life. If he finds otherwise, then a real service is rendered both him and society by determining that fact as soon as possible.

Thirty miles northeast of the State School of Agriculture at Cobleskill, is the city of Schenectady with 89,000 souls. Among the youth of the city are some adventurous and enterprising boys who like not the brick and mortar and noisome goings-on which are with them when they awake and when they

By H. B. KNAPP

Director, New York State School of Agriculture at Cobleskill

fall asleep. These boys dream of other things. By arrangement with the superintendent and principals of the city schools, and with the cooperation of the State Education Department—the State School of Agriculture at Cobleskill brought twelve of these boys to the school farm during July for a try-out course. Some of these boys had enjoyed some contacts with farm life, others had none, some knew that cows had to be

crete and set up oats and watched the self-binder work. They opened one of the new silos, and threw off the top until the silage was fit to eat. And they asked questions all the time—when the new calf came and the old cow went for beef and the hens laid in the trap nests and some of the white hens laid brown eggs and some of them didn't.

In the afternoon they played baseball, or went fishing, or swimming, or for hikes. Sometimes they camped out overnight at a nearby stream or lake and told stories around a campfire with the stars overhead and the city far away. The illustration shows them starting on such a trip.

Of course, everything was done under close supervision of members of the school staff, both work and play. It was a strenuous time for those in charge. Although they were active every moment that they were awake, the boys made an average gain in weight of one and one-half pounds during their stay.

The main thing is that the experience seemed worthwhile. The school has learned some things and will try again next year, running several such camps during the season.

Some of these boys will surely become farmers. That is well.

Some will not. That also is well. But every boy had a real opportunity to learn for himself some things about country life, so that he may more intelligently choose the way he shall go. That is best of all

I Wouldn't Go Back to the Old Times

I HAVE been reading the different articles by various readers of the American Agriculturist about the good old times which they claim were so much more superior than the present times. Now I come to the defense of the present generation to which I belong, and I think in fairness to this generation my side of the question should be heard.

I like living now. I wouldn't go back to the old times. I see dozens of things about our modern life which seem to me vastly more desirable than the old time ways of living. Everybody seems to harken back to the old times and think they were perfect. I guess the reason must be that time has softened the memories and made every-

(Continued on page 270)

"Some of these boys will surely become farmers. That is well. Some will not. That is also well. But every boy had a real opportunity to learn for himself some things about country life, so that he may more intelligently choose the way he shall go"

milked and some did not. All thought they were interested in farming as a vocation. They were on the average, fourteen years old, one being eleven and four being fifteen.

They were housed in quarters provided for them, and fed in the school dining room, being given plenty of eggs, fruit and all the milk from the school herd that they wished. Every boy drank milk, some drank four or five glasses at a meal.

In the morning they worked in the barns or on the farm. The first morning they were up at four o'clock, although not due at the barn until 5:30. They fed cows and calves, milked, cleaned stables and watched the milking machine at work. They watered, fed, harnessed and cleaned the horses. They fed the poultry, and gathered the eggs. They bunched and loaded hay, mowed it away, and drove on the horse fork. They saw the mowing machine, tedder, rake and hay loader in action. They pulled weeds and thinned beets by hand, and hoed corn, and potatoes, and drove the walking cultivator. They picked berries, and currants, and cherries. They whitewashed the cow barn, help mix con-

Invite Your City Friends

WHAT will be the largest and best Fruit Show ever held begins in Grand Central Palace in New York City on November 3 and lasts for a week. The purpose of this show is to convince the consumer of the value of fruit in the diet from both a health and food standpoint.

Several of the floors in this largest exposition building in the world will be a fairyland of apples and other fruits and all the machinery used in the production and transportation of horticultural products. Apples and other fruits of every kind and description, but all of high quality will be on exhibit in large quantities; there will be an old-fashioned farm kitchen with farm women actually making the pies like "Ma used to make." The Domestic Science Departments of the different colleges will have exhibits and actual demonstrations, showing all the good things that can be made from fruit. There will be apple-cider mills in operation with all the sweet cider you can drink, and it will be possible for everyone who attends to obtain apples to eat free of charge. The city newspapers will carry news notes and advertising about the fruit and thousands of children in the New York City schools will write compositions about apples and apple growing.

Space is too limited here to tell of all the many things that are planned to bring to the attention of consumers the value of fruit in general and of eastern fruit in particular. There is no reason why city people should not increase their consumption of fruit to their own advantage at least twenty-five per cent, and efforts such as this Eastern States Apple Exposition and Fruit Show will do much to bring about such increased consumption.

The great need is to get many thousands of city dwellers to attend the show and one of the ways that you can help is to sit right down now and write as many letters as you can to people whom you know in the city, even if they are only casual acquaintances, telling them about this show and urging them to be sure to attend. If 20,000 fruit

growers would make this small effort it would insure the success of the purpose of the show to increase the consumption of eastern-grown fruit.

Milk in the Text Books

THE National Dairy Council announces that that excellent organization has been able to incorporate some milk information in the form of reading lessons in one of the school readers used extensively in many of the public schools. This is something that we have advocated for years.

For more than a generation the new physiologies textbooks used in all the schools have had much to say about the evil effects of alcohol in the human body. The law compels the teaching of the effects of alcohol to every child. Whether you believe prohibition is a good thing or not, all must admit that no other single influence has been as great in eliminating the saloon as the constant teaching in the schools year after year of the evil effects of alcohol. "Train up the child in the way he should go, and when he is old he will not depart from it." All health and food authorities agree that milk is the most wonderful food in the world. If this be true, then the constant teaching and reiteration of this fact in the daily lives of the young will surely lead to increased consumption, benefitting both him who uses this great food and him who produces it.

"No Other Way As Good"

LAST night we heard Sousa, that greatest of music composers and masters, and his band of over two hundred and fifty musical artists play in Madison Square Garden. This is without doubt one of the best musical organizations in the world. Sousa's is essentially a patriotic band for all of its programs and much of the music, especially that which the leader has composed himself, is martial and American in spirit. Near the close of the program, Sousa's organization was supported by the band of the Seventh Regiment and the Mecca Shrine Temple Band, making a grand total under the leadership of the great master of over three hundred men.

It is beyond the power of mere words to describe the wonderful contrast of the tremendous volume of melodious sound softened in the next second to the faintest vibrations of beautiful harmony. At the wave of the hand, literally hundreds of brass instruments supported by dozens of drums of every description remind you of marching men and of roaring battlefields, to be followed instantly by the flutes and clarinets whispering of sunshine on smiling landscapes, of love and of peace.

Near the close of the program more than three hundred officers and enlisted men of the navy marched into the great auditorium and lined up alongside of the band, the marines, the "fighting gobs," on one side and the enlisted sailors on the other. Then came the colors, guarded by the marines with guns, while the band played the national anthem. The sailors stood at salute and the audience of more than eleven thousand people rose in the mighty tribute of absolute silence.

Such a scene comes as near as it is ever possible to portraying the real spirit of America. As one listens, he is carried from present time and place back to those other days when American sailors, soldiers and plain citizens through labor, hardship, battle and sacrifice welded into the foundations of this nation all those principles that the old flag represents. At such a time, one recalls Americans like that first indomitable fighting captain, John Paul Jones, and his immortal words: "We have just begun to fight"; or he will remember those other words of Captain Perry on Lake Erie: "Don't give up the

ship," or Farragut damning the torpedoes at New Orleans or Dewey and his sailors breaking past the forts into Manila Bay. Moved out of yourself by the sublime music you think of all those others who have made it possible to say that American sea fighters have never been defeated in open battle on the high seas. Neither does it take much imagination stimulated by playing band and saluted flag to recall the unfaltering spirit of American soldiers from Lexington to Chateau Thierry; or the plain farmer pioneers who followed the unblazed trails with ox-cart and covered wagon from sea to sea and left behind them a smiling farm country conquered by that mightiest of all weapons—the plow.

Yes, to-day in this Republic we may and do have selfishness, greed, exploitation and abuse of political power, we do have much discouragement and disillusion, but still when the soldiers and sailors stand in grave salute and the band plays the national anthem, while the flag goes by we know that while "Every charge ever made against Democracy may be true, there is no other way as good."

Eastman's Chestnuts

DID you ever notice that when a group of men get to telling stories, most of them will stand with a sort of dazed far-away look in their eyes while you are telling yours? Some of my friends are mean enough to say that it is easy enough to explain the dazed look when I tell mine, claiming that trying to see the point in some of my stories is enough to daze anyone. But this is just base insinuation, and I refuse to be discouraged. The real reason for the absent-minded look is the fact, that an inveterate story-teller pays not the slightest attention to the yarn which is being spun. His thoughts are far-away instead, trying to think up another one to butt in with as soon as you are finished. When you are done, he will laugh half-heartedly and say: "Oh, that reminds me. Did you ever hear this one?" And before you can open your mouth to tell him that you probably have heard it six million times, he launches forth.

Well our little joke corner here has evidently reminded a lot of the yarners, for every mail brings the chestnuts, some of them pretty good, too. The only trouble is there is not room to print them all.

But here's one sent in by Tom Milliman that we have just got to publish right away, because we are sure that poor Tom is sitting up nights waiting to see it in print. Tom, you know, is manager of the Membership Service Department of the Dairymen's League Cooperative Association, so you probably have attended meetings where he has spoken and been afflicted by his stories before. His yarn goes something like this:

Finishing the circus season and about to leave England, P. T. Barnum, the greatest of American showmen, was given a testimonial dinner. As he was departing, the bishop of London said to him:

"Good-bye, Mr. Barnum. I hope to meet you in heaven."

And Barnum promptly replied: "You will, Mr. Bishop, if you are there!"

Quotations Worth While

He who would look upon the farmer's pursuit with contempt is not worthy of the name of man.—HENRY WARD BEECHER.

Rotten wood cannot be carved—CONFUCIOUS.

Each Side Accuses the Other

But the Final Vote on Prohibition Will Show How Farmers Stand

By A. A. READERS

I AM enclosing herewith, my vote and those of a few of my friends, on the question of prohibition, and cannot refrain from "saying a few words" on the subject, although I am not much given to breaking out in this way.

I am absolutely and unalterably opposed to the whole prohibition business for several reasons. In the first place it was hatched and developed in lies, trickery and deceit, and put across at a time when the people were ready to do anything for the country without stopping to ask questions, when two millions of our boys were in France attending to Uncle Sam's little scrap, and was finally enacted into "law" in a high-handed, strong-arm fashion without reference to the people. Nobody had a chance to say whether they favored it or not; in other words it was done much after the fashion of the highwayman who throttles you while he steals your watch.

Secondly the Government loses many millions in revenue, while we are paying high taxes and everything else to make up the deficiency, to say nothing of the immense amount of money squandered for "enforcement" and other fake prohibition activities which merely waste the people's money and accomplish nothing.

Prohibition, to my mind, has done more to break down, destroy and demoralize than appears on the surface, but its effects are there, eating deeper and deeper into the daily life of the nation. It has broken down respect for law, for few respect the Volstead act, but rather look upon it as a measure of unjustifiable oppression, something to be disregarded as much as possible and broken when necessary.

It has destroyed the belief that our laws were fair, honest and impartial, for the Volstead act is distinctly a one-sided law, favoring the rich man and those "in the ring" against the rest of the community. The fellow with a big bank account laughs at prohibition and stocks his cellar, while the poor man goes without or pays a ridiculous price for vile stuff not fit for consumption, and takes a long chance every time he drinks it.

This is supposed to be a country where we pride ourselves on our sense of fairness and the square deal, but, if that is so, I do not see how anybody, be he churchman or not, drinker or dry, can conscientiously uphold this iniquitous law. Do you suppose for a moment that your high officials in Washington, your legislators, politicians, elected or appointed officials everywhere and the police, are going short? Not a bit of it; they are getting all they want for nothing, for their influence and protection.

I believe that if the question was put before the people, and they were given a chance to vote upon it, they would come out squarely for beer and wine. Yes and for whiskey, too, under proper Government supervision, but there is one big obstacle in the way of such a solution of the matter, and that is GRAFT; the country is flooded with it, and from top to bottom—your high man in Washington to your little bootlegger, the man with a five gallon still in his cellar and the cop on the beat is "getting it."

I know of a case where a man, who two or three years ago had little of this world's goods, to-day can write his check for \$50,000 and has seven autos in the booze business. And yet your dry fanatic "points with pride" to the wonderful "success" of prohibition.

It is to laugh! It is to ROAR! !—F. W. E., New York.

* * *

Placing Wets In Three Classes

WHILE not a regular subscriber to your paper I try to obtain a copy each week and have been following the "Wet and Dry" discussions with considerable interest.

I am a traveling man and have had an excellent opportunity to view this question from every angle in many different localities, and as I note the great change for the better in the lives of the families of the average laborer and day worker, especially in the smaller cities and towns, I am becoming more and more a confirmed "Dry."

Naturally I have heard innumerable arguments and discussions on this question during twelve years on the road, but never yet have I sat and listened to a "Wet" advocate, whom, after some subsequent conversation, could not be easily placed in one of the three following classes; viz:—

FIRST.—He who actually has a liquor appetite—the steady old day-by-day whiskey drinker who would gladly sacrifice the happiness of all the rest of the world, if need be, could he but bring back the "good old days" with the ten-cent liquor and the nickel quart of beer at the corner saloon. To such as he, we need give but a passing thought. He's too yellow and too poor a sport for any important place in to-day's world.

SECOND.—He who is (or was) financially interested in the liquor traffic and would move heaven and earth, were that possible, to again direct that stream of easy money to his own pocket—it being "gall and wormwood" to him to see Mr. Average Man spending this same money on his own family, on his own home, or perchance in the purchase of the new car. Him we may dismiss with no regret. He represents nothing but the lowest form of swinish degeneracy, and has no ethical place in the councils of decent humanity to-day.

THIRD.—(And by far the most numerous.) He whom we hear talking loudly in the hotel lobby, in the smoking-room of the sleeper, or to an interested audience at the country store. He tells us how much more liquor is now being consumed than "before Volstead." How many rich bootleggers he personally knows. How many preachers and church-workers, senators and judges, farmers and others of his personal acquaintance, who have now absolutely all the liquor they want. How many otherwise (and still might have been) good clean young girls and boys he has known who have gone to the devil "all on account of Volstead." 'Sawful gentlemen, believe me, and if we don't "rise in our wrath"—"assert our right to personal liberty" and—"repeal this horrible law that now afflicts honorable men" and "which menaces the very foundation of our national life"—"we are bound for the 'demnition Bow Wows'" and so on *ad infinitum nauseatum*.

But here is the joker with this fellow—try to pin him down to concrete definite cases and he is not there. Much of it is mere repetition of something he heard someone say they "heard."

But as for the farmers being wet—they are not, absolutely not. My association is largely with the farmer and his family and I assure you I am right. In all his history, as a class, the farmer has always stood for the decent things in life and he's right there on this question too. With him, of course, there stand all honestly decent, clean-minded Christian women everywhere.—J. C. M., New York.

* * *

Says Prohibition Is a Farce

THERE seems to be a mistaken idea that farmers as a whole are prohibitionists. If the truth could be known, I believe that you would find that it is not so. The idea no doubt is fostered by the fact that our agricultural press, such as your paper, the local papers circulating among farmers are without exception, as far as I have read them, all for prohibition. One is inclined to wonder how much of this local press propaganda is paid for.

I am one who up to prohibition times, enjoyed the luxury of an occasional glass of wine. I would even this noontime have enjoyed a glass of beer with my dinner. But my desire for these luxuries did not cause me to stock up as many people did, so I have to do without or bootleg it, which I decline to do. It does seem to me that it is about time the American people woke up to this damnable encroachment on the liberties of the common people

PROHIBITION BALLOT

OF THE

AMERICAN AGRICULTURIST

Are You for the Strict Enforcement of the 18th Amendment as It Now Stands ? ☐ YES ☐ NO

Are You for a Modification of the 18th Amendment to Permit Light Wines and Beer ? ☐ YES ☐ NO

Designate your opinion by placing an X in the square opposite Yes or No on each question. Sign your name and address. Your name will be kept *strictly confidential*.

Name.....

Address.....

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

Get your friends to vote—More ballots furnished on application

Dairy Show High Lights

"So Beeg, So Beeg, I No Can Grasp It"

I HAVE just returned from the Dairy Show at Syracuse, and while the presses for this issue wait, I want to give you a few outstanding impressions of what was the largest and in many respects, the best gathering of the dairy interests ever held. Details such as the award of prizes and other information will follow in next week's issue.

The attendance, while very good, was somewhat disappointing to the promoters. Before the Dairy Show could be brought to Syracuse, it was necessary to guarantee the leaders an attendance of 100,000 people. I have not the final figures at this writing, but the indications are that the total will be somewhat less than the 100,000 expected.

Another thing that impressed me about the people who attended the Show was the apparent absence of the average dairyman, the man who does not own pure-bred cows, but who does milk from ten to twenty first-class grades. I think it is a just criticism of the Dairy Show that not enough average farmers were there, and that there was not enough appeal to such farmers when they did come. It was a breeders' show and not a dairymen's show. Of course, one reason for this is the fact that the average farmer because of pressure of work and shortage of help had to stay at home and milk his own cows instead of going to see somebody else's.

The machinery exhibit was impressive. It was the largest in both amount and variety that I ever saw. No one could walk through and make even a brief inspection of the complicated and costly machinery used in the production and particularly in the manufacture and distribution of dairy products without realizing the tremendous costs that are involved in handling milk. When you see this machinery, knowing how costly it is and how much of it is needed, even to equip one modern milk plant, you get some idea of why there is such a difference between what the farmer gets for his milk and what the consumer pays for it. Certainly there are few other lines of business where the machinery and equipment capitalization is so high.

The exhibits and demonstrations showing the food value of milk and its products were both interesting and educational. The large number of people that stopped before the nutritional exhibits showed the interest that everyone is now taking in the food value of dairy products.

One of the most interesting things to me was the several beautiful designs and monuments made entirely out of butter. For instance, Ohio had a com-

By E. R. EASTMAN

plete and fairly large size statue of the late President Harding sculptured entirely from butter and preserved in a glass enclosure where the temperature was low so the butter could not melt.

There was every kind and variety of cheese made in the world and liberal quantities were given away. So attractively arranged and of such high quality were these cheese exhibits that I know nearly everyone who saw and tasted them made the same resolve that I did; that is, to go home and buy more cheese, and especially try out some of the fancy varieties. Nor should we forget to mention Dairymen's League ice cream which everyone was eating.

But, of course, the big thing of the Dairy Show was the cows, and I think it perfectly safe to say that never before were there so many of such high quality dairy animals ever brought together. All of the time that the judging was going on the great majority of all the people on the grounds showed their interest in the cattle by sitting or standing for hours in the new Coliseum to watch the beautiful representatives of the leading dairy breeds as they were led up and down in the ring while the judges did their work.

But I am sorry to say that except for the time that the judging was going on, this exhibition of the best dairy cows in the world was of little benefit to the average dairyman. The animals were kept covered with blankets in the barns and except for a comparatively small number there were no descriptions in any way, shape or manner about any particular individual or herd. I claim and I have said for years, that to the average farmer a large part of the value of an exhibit of dairy cattle is lost at the county and State fairs and the National Shows because there are no descriptive signs to tell one cow from another. In addition, they are usually blanketed.

And to add insult to injury, if one had interest enough to want to learn something about these great animals, he was forced to go and look up a catalog, and pay for it, of course only a very few will do this. Because of this, I am inclined to sympathize with the man who said: "Where is the dairy in the Dairy Show?" meaning that he was disappointed in the lack of intimate appeal to the man with the small herd of grades.

I believe that one of the best results from this Dairy Show and the World's Dairy Congress, held in conjunction with it, is the impressions which the hundreds of delegates from all over the

(Continued on page 274)

This is a reproduction of the center of the magnificent exhibit of the United States Department of Agriculture at the National Dairy Show. On the left of the stream is the farm country representing the "Supply of Farm Products." On the right is the city, representing the "Demand for Farm Products." The bridge, spanning the gap and connecting the two is "Cooperative Organization," over which a train of produce is passing. The piers or the foundations of the bridge are "Well Informed Membership" and "Sound Business Principles." The keystone of the arch is "Mutual Confidence." The other blocks in the arch supporting "Mutual Confidence," represent essential business principles in successful cooperative organization. In the background is the dawn coming up, "Cooperative Marketing." This exhibit is by far one of the cleverest and most inspiring at the Dairy Show

Aspirin

Say "Bayer" and Insist!

Unless you see the name "Bayer" on package or on tablets you are not getting the genuine Bayer product prescribed by physicians over twenty-two years and proved safe by millions for

Colds	Headache
Toothache	Lumbago
Earache	Rheumatism
Neuralgia	Pain, Pain

Accept "Bayer Tablets of Aspirin" only. Each unbroken package contains proper directions. Handy boxes of twelve tablets cost few cents. Drug-gists also sell bottles of 24 and 100. Aspirin is the trade mark of Bayer Manufacture of Monoaceticacidester of Salicylicacid.

OIL LIGHT BEATS ELECTRIC OR GAS

BURNS 94% AIR

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

The "Pride" A Modern Bathroom, \$60

Just one of our wonderful bargains. How Buyers Figure the Price of Potatoes

C. E. LADD

ON September 21, New York State potatoes were quoted at \$3.30 per 150-pound sack in Pittsburg. The price in other nearby markets was about the same.

This is the way that the cash price to farmers is calculated by the shipper or by farmer-owned cooperative shipping associations. The freight rate from central New York points to Pittsburg is 28½ cents per hundredweight or 42¾ cents per sack. Subtracting this from \$3.30 leaves \$2.87¼, the price of a sack of potatoes on the track at the loading point.

The usual carload contains 240 sacks or 600 bushels of potatoes. Therefore, 240 sacks at \$2.87¼ total up to \$689.40, the carload selling price. Subtract from this:

Cost of loading, grading and sacking	\$30.00
240 sacks	25.00
Brokerage for selling	10.00
Draft collections by bank	1.72
Buyers margin to cover other costs, losses, bad debts, profits, etc.	50.00

Total	\$116.72
Net	\$572.68

Dividing \$572.68 by 600 bushels equals 95 cents per bushel paid to the grower for his potatoes.

If a cooperative shipping association is handling the potatoes an amount about equal to the buyers margin is ordinarily put into the so-called "Reserve Fund" to cover the same costs and losses as listed above. Under very careful management a small amount of this may be returned to the grower at the end of the year. Under inefficient management or if the association has too much invested in buildings or too high an "overhead cost" of operating, none of this may be returned.

Losses due to damage to potatoes in transit, freezing, poor grading and various other causes are much larger than one would expect. If potatoes do not arrive in good condition at the market point the buyer may refuse to accept them unless the seller makes a deduction in the price. Whenever the market price declines, buyers inspect the potatoes very critically to find a cause for rejection and consequent reduction in prices. If the price is dropping rapidly irresponsible buyers may refuse the potatoes altogether. This places the shipper at the mercy of the buyer as the potatoes must be moved quickly to escape demurrage charges.

These losses from deductions in selling prices, poor grading, freezing, etc. will ordinarily amount to enough in a season to average from \$10 to \$15 per car for every carload shipped by the cooperative association or commercial shipper.

HOLD HAY OR SELL NOW

Would I be money ahead by pressing a stack of hay this fall? Buyers are paying \$12 a ton, which I do not think is high enough. On the other hand, do you think it will be higher and would it pay me to hold until spring?—L. J. F., New York.

There are several factors that enter into your problem and deal with your personal situation. In the first place, much depends on your financial condition. If you need money right away, obviously it will be a risky thing for you to hold your hay until spring. There are many other factors to take into consideration, such as shrinkage, fire hazard and the possibility of a declining market.

If you have noticed the news from "among the farmers" and "county notes" in American Agriculturist of recent issues, you will note that reports from some parts of New York indicate that the hay crop is going to be short. Then again other sections report a good hay crop. New Jersey's hay crop was a miserable failure. New Jersey always has been a buyer of hay, but she will have to buy more this year. Then again the extremely dry season compelled farmers to feed earlier than usual and much of their reserve hay supply was consumed early this fall.

It all depends on the quality of your hay whether or not you will get top (Continued on page 274)

PAY FOR YOUR SILO FROM EXTRA PROFITS

Most Liberal Terms Ever Offered to Silo Owners

YOU can now secure the famous Harder Silo, equipped with the new Harder-Victor Front on terms that will make the silo pay for itself through feed saved and increased milk flow.

A small cash payment will put a Harder Silo upon the farm of any responsible farmer. The remaining payments may be spread over an entire year. If you have put off buying a silo because of the cost, investigate the Harder now and pay for it out of the extra profits from your dairy.

Never before have you been offered an opportunity to get a high-grade silo on such liberal terms. You cannot afford to longer put off owning this money-saving and money-making piece of farm equipment.

The New Harder Better Than Ever

The Harder is air-tight and stays air-tight. It is made of selected grades of the best silo woods—especially treated to give long life. The first silos, erected in 1897, are still making money for their owners after more than twenty-five years service.

The new Harder-Victor Front provides an absolutely air-tight continuous door that remains permanently in the silo—a great convenience as every feeder knows. This magnificent door is built up in layers—will not buckle. A single movement of the hand locks it securely into place.

The Harder is easy to put together, you can do the work yourself, saving the cost of erection. John T. Schang, Yorkshire, N.Y., writes: "The silo is a dandy. I put her up alone; everything went together fine. The roof and all present a fine appearance."

Send for "Saving With Silos"

Now is the time to get full details concerning the New Harder Payment Plan. Delay means loss of profits. Write today.

Handy Pocket Record Book—FREE

HARDER SILOS Are Easier to Buy

Harder-Victor
Silo Front

Write today for
this free book.

New Harder-Victor Front combines beauty and strength—the greatest silo improvement in ten years.

Dowel-spline at stave end insures a tight joint and a rigid silo.

Other Harder Features:

Beveled staves with deep, square tongues and grooves give perfect contact, whatever the diameter of the silo.

The staves are thoroughly dowelled together—not merely matched. They can't slip.

Only select timber is used. Gambrel Roof adds four feet to the silo capacity. Gives you a full silo after the settling.

Harder Anchors hold the silo solid as an oak. No gale can blow down a Harder silo.

Continuous steel hoops of great strength. Easy to adjust.

Special acid and decay-resisting wood preservative supplied for inside of silo. Also Siloseal for joints. These lengthen the life of the silo.

Absolutely air-tight. Silage keeps sweet the year round.

Safe and convenient ladder with non-slip steps.

KEYSTONE EVAPORATOR FAMOUS EVERYWHERE

because one man can operate without help of any kind. Our new Keystone Heater increases capacity 40 per cent. Uses all waste heat.

Puts 2 H-P Engine on Your Place For Only \$14²⁴

Ed. H. Witte, Famous Engine Manufacturer, Makes Startling Offer On Witte Throttling-Governor Magneto-Equipped Engine

Farmers, now more than ever, appreciate the need of power on the farm and know they can make \$500 to \$1,000 additional profit a year with an all-purpose engine. Ed. H. Witte, nationally-known engine manufacturer, has announced a 2-horse power engine which burns either kerosene, gasoline, distillate or gas with a special throttling governor. It delivers full power on kerosene, gasoline, distillate or gas.

This new WITTE ENGINE has revolutionized power on the farm as it handles practically every job with ease at a fraction of the cost of hired help. Easily moved from one job to another, it is trouble-proof and so simple that a boy can operate it. To introduce this wonderful new engine to a million new users Mr. Witte has arranged to put it on any place for a 90-day guaranteed test. Since it costs only \$14.24 to take advantage of this sensational offer and nearly a year to pay the low balance. Mr. Witte confidently expects every progressive power-user to be soon using a WITTE. Every reader of this paper who is interested in making bigger profits and doing all jobs by engine power should write today to Mr. E. H. Witte, 1805 Oakland Ave., Kansas City, Mo., or 1805 Empire Bldg., Pittsburgh, Pa., for full details of this remarkable offer. You are under no obligations by writing.

News From Among the Farmers

Dairymen's League Announces September Prices—New York Farm News

THE Dairymen's League Cooperative Association announces that the gross pool price for September milk is \$2.30. From this gross price there will be deducted 10 cents for expenses, leaving a net pool price of \$2.20. From this amount the association will borrow 10 cents per hundred pounds on Certificates of Indebtedness. This leaves a net cash price to farmers of \$2.10. September prices compare very favorably with those received for milk delivered in August. The gross pool price for August was \$2.19 and the net pool price for the same month was \$2.085. The net cash price to farmers for August milk was \$1.985.

STATE FAIR GUESSING CONTEST WINNERS ANNOUNCED

Commissioner of Farms and Markets Berne A. Pyrke has announced the winners in the contest conducted by the department, in the State Institutions Building, at the State Fair, in which estimates were submitted by visitors to the exposition on the amount of milk produced by nine cows which were on exhibition. The contest aroused a large amount of interest, especially among farmers and cattle owners during the week, and a total of 8,840 estimates were submitted on the cows exhibited. Commissioner Pyrke stated that the contest was intended to emphasize the economic advantage of improved stock, and the desirability of daily milk records of individual cows, thus providing for the elimination of unprofitable animals. The prizes consisted of four pure-bred calves and \$100 in cash. Almon O. Nye, Pleasant Valley, N. Y., was the winner of the first prize, which consisted of a choice of four calves, and selected the pure-bred Guernsey Bull Calf donated by Henry

M. Sage, Fernbrook Farm, Albany, N. Y. W. A. Pritchard, of Oswego, N. Y., won second prize, a pure-bred Ayrshire Bull Calf from the Metropolitan Insurance Company Sanitarium Farm, Mt. McGregor, N. Y. H. W. Burritt, of Romulus, was third in the contest and the winner of the pure-bred Holstein Heifer Calf, donated by R. E. Chapin and Son, Bonalevo Farm, Batavia, N. Y. Fay J. Dougherty, 106 Eldorado St., Syracuse, won fourth prize, a pure-bred Jersey Bull Calf donated by Meridale Farms, Ayer and McKinney, proprietors, Meredith, N. Y. Leigh H. Park, Cortland, was fifth and won the \$50 cash prize. C. H. Burroughs, Savannah, was sixth, prize \$30.

The nine cows, which were from the State Institution farms, were lined up in stanchions in the State Institutions building, at the State Fair, and numbered. Cards were handed to visitors and they were asked to indicate on the cards the order of the cows, in the matter of the amount of milk production.

WESTERN NEW YORK NOTES

ALVAH H. PULVER

Copious rains breaking the long drought have done much to help the late fruit crop fill out. Altogether, September proved far different from the previous growing months as nearly four inches of precipitation was received in the fruit belt of western New York. This is a high figure for this month and untold good was done by the timely rains.

Usual Wheat Acreage Planted

In spite of the fact that farmers are now receiving a much lower price for their wheat than they had planned on, about the usual acreage of winter wheat will be planted in most sections of western New York this season. The rains were of decided benefit to the growers, as for some time the land had been too dry for planting. Practically all the growers, heeding their farm bureaus, held off planting until September 20 had passed so as to dodge the Hessian fly. The growers assert that during the last few years they have been growing wheat at a loss in most instances. The growers' records have shown that on an average it costs them approximately \$1.25 a bushel to raise wheat on most farms.

NEW YORK COUNTY NOTES

Essex Co.—A few rains during the last two weeks in September broke the long dry spell, helping pastures and relieving the water supply. However, the rain came too late to help crops materially. Oats and barley have turned out very well, but corn made a poor crop. However, there will be considerable corn fodder. Silos are all filled. Many farmers are working teams on the road, to bolster up their incomes a little. Butter prices are improving and farmers are feeding their cows in the barn. Eggs, 50c a dozen; peaches, \$2 to \$2.25 a bushel.—M. E. B.

Broome Co.—After several killing frosts in the third week in September, quite a rainy spell set in. However, the rain came too late to help crops to any extent. Springs are flowing once more and fall plowing has been made easy. Fruit is scarce and high. Potatoes have been bringing from \$2.75 to \$3.50; peaches have not begun to come on the market in any amount. Eggs are now bringing 50 cents. Threshing and silo filling are about completed.—Mrs. E. M. C.

Steuben Co.—Rain during the last week in September helped pastures and late crops to some extent. However streams and springs are still very low. Water for stock is scarce on many farms. Frosts have damaged much ensilage corn. Many potato fields have also been seriously damaged by frosts. There is some complaint of late blight in potato fields where the potato crop will be light, not more than forty per cent normal. The buck-

wheat crop which looked very promising before the cold weather of middle September was hurt by frost.—H. I. D.

Wyoming Co.—Severe frosts during the last week in September caused damage to corn, potatoes, buckwheat; in fact, nearly everything. Silo filling is completed. During the last week in September, potatoes were selling at \$1 a bushel; tomatoes, \$1.20; plums, \$2; eggs, 35c; butter, 45c to 50c. The bean crop is turning out very poorly; there will be little more than half a crop. Apples promise to be fair.—L. W. F.

Each Side Accuses the Other

(Continued from page 265)

of whom the farmer is a considerable class.

I am a church member, but I do not blame people sometimes for neglecting church going as our ministers preach prohibition more than anything else and I believe people are pretty sick of it. Prohibition has proven a farce as far as keeping liquor from those who abuse it, as every one knows. Those who got drunk before prohibition, are still drinking while the decent man is deprived altogether. Some one has said that "eternal vigilance is the price of liberty." Let us hope that some leader will arise and give the people a chance to make their will effective in this matter.—J. J. P., New York.

HAVE been a reader of your paper for many years and I am glad of your method of approaching this issue. I am a resident of Atlantic County and Atlantic City. Our best market has enjoyed the distinction of being America's playground until prohibition has made it anything but a desirable place to visit. Prohibition, as viewed by the farmers of this county, has made thousands of "law breakers" from good law-abiding citizens and our Grange and county board, of which I have the honor of being president, are very much in favor of a modification of the Volstead act.—J. C., New Jersey.

Drink and the Farm Help Problem

PROHIBITION is a highly economic, as also a moral problem and will win out as such. No class of citizens have greater interest in the subject than farmers who are overwhelming in majority for it. The Grange represents the most intelligent and progressive farmers throughout our United States and its members, men and women, for years have been unceasing in their efforts to abolish the legalized sale of intoxicating liquors.

On my farm I have made it a rule not to rent a house to a drinking man, or to allow day workers to bring beer or whiskey upon the farm in their dinner pails or baskets. Some of my best workers have been young men discharged for their drink habit.

They proposed that if a movement would be made to close all saloons, they would work for it for "if one saloon was left the boys could not go by it." A town election was held and a dry majority of twenty-eight was obtained. The liquor forces succeeded in getting a new election when a dry majority of 129 was the result, the drinking young men doing their best to have a dry town.

Our agricultural interests, joined by the general business interests of our nation, stand by the Eighteenth Amendment and the enforcement of the act.—G. T. P., Mass.

Booze and the Autos

WITH the fast auto traffic, prohibition is absolutely necessary. Drunken drivers are killing too many now. As to the personal liberty, how will law against murder and theft deprive men of personal liberty and have never been fully enforced. Prohibition is as necessary as either, for drinking not only is a curse to those now living, but to the generations unborn.—READER, New York.

\$1,000 Insurance for 75c.

As a part of our broad policy of service to readers, we now offer you a \$1,000 Travel Accident Policy for one year with a three-year subscription for *American Agriculturist* all for only \$2.75—just 75 cents more than our special price for a three-year subscription alone.

You May Be Hurt or Killed In a Train or Auto Accident Tomorrow

Don't make the mistake of neglecting your family's financial welfare in case the unexpected accident comes to you. Is not your own peace of mind worth the small amount of our accident policy? You need protection. Tomorrow may be too late. Order one of these policies today.

MAIL THIS COUPON AT ONCE

TO AMERICAN AGRICULTURIST, 461 FOURTH AVE., NEW YORK CITY.

GENTLEMEN: Please enter my subscription for *American Agriculturist* three years and send me a \$1,000.00 Travel Accident Policy, good for one year. Enclosed find \$2.75 in full payment for both the policy and subscriptions.

Concrete on the Farm

The Ideal Mixture For Practical Purposes

THE ideal mixture is one in which there is just enough sand to exactly fill the voids in the coarse aggregate and just enough cement paste to cover the surface of each particle of sand and coarse aggregate and just fill all the voids. In practice we endeavor to proportion our material so as to approach as closely as possible this ideal condition. For all general purposes, if the volume of sand is equal to one-half the volume of gravel and the volume of cement is equal to one-half the volume of sand, the resulting mixture is near enough ideal, so proportioned the sand concrete mortar is slightly more than enough to fill the spaces in the coarse aggregate.

Bank-run gravel is the name usually applied to the natural mixture of sand and pebbles as taken from a gravel bank. While it is the general practice to use this bank-run gravel for concrete, it is not, in most instances the most economical thing to do without screening. As a rule bank-run gravel contains too much sand. It is best to run the bank-run gravel as it comes from the pit over a one-quarter inch mesh screen so as to separate the sand from the pebbles and then re-proportion them later in the volumes desired. If the bank-run gravel, containing too much sand is used, an excess of cement must be added to the mixture or it will not be of the strength desired. The reason for this is that the greater

By F. G. BEHREND

ty of bank-run gravel is screened to get sufficient coarse aggregate so that when this is mixed with the bank-run material the approximate proportions will be obtained. The excess of fine material or sand accumulated may be used for making sand cement mortar for plastering or for surface coats, etc. It often happens that only a few yards of concrete are to be laid. Bank-run gravel can be easily obtained. Coarse material must be obtained elsewhere or additional bank-run gravel must be screened. Under such conditions it may be more economical to use bank-run gravel, using some excess cement.

Proportioning Concrete Mixtures

In order to obtain a strong, dense, durable concrete, the materials entering into it must be definitely proportioned. For a given purpose, a definite quantity of Portland cement with a definite quantity of sand and a definite quantity of gravel give the best results. These quantities of materials,

A total of seven cubic feet of cement, sand and pebbles makes only four and one-half cubic feet of concrete, most of the sand and cement filling the spaces between the pebbles

the per cent of fine material the greater the amount of surface to be coated with cement and the greater the volume of voids to be filled with cement. It is therefore a matter of economy to grade the aggregates so as to secure the minimum volume of voids or air spaces to be filled, and surfaces to be covered with cement.

Using Bank-run Gravel

Suppose it is desired to mix a batch of 1:2:4 concrete—1 sack of cement, 2 cubic feet of sand, 4 cubic feet of gravel. The proportion of cement to aggregate before mixing is 1 cubic foot of cement to 6 cubic feet aggregate. When mixed, however, the total volume of concrete would be but slightly over 4 cubic feet because the sand would fill the spaces in the gravel and the cement would fill the spaces in the sand. (See figure 1.) The proportion of cement to concrete is 1 to 4. Suppose 6 cubic feet of bank-run gravel were used for the aggregate instead of 2 cubic feet of sand and 4 cubic feet of gravel. When mixed with 1 cubic foot of cement the volume of concrete would now be 6 cubic feet. (See figure 2.) In this case the proportion of cement to concrete now 1 to 6 is less than when the aggregates were proportioned. All the voids would not be filled, and the concrete would not be as dense or as strong as if a 1:2:4 mixture had been used. From this it can be seen that it is always best to screen bank-run gravel and re-proportion the sand and gravel as desired.

A common practice, where bank-run material is to be used in small concrete work such as may be done on the farm, is not to screen all the material and re-proportion it, but to determine how it is already proportioned. It will usually be found that there is not enough coarse material. A quanti-

which when mixed give a concrete of the proper strength and density for the particular work are expressed as 1:2:4, 1:3:6 etc. and are used to express the mixture.

Table of Recommended Mixtures

For the guidance of the readers the following suggested mixtures are recommended for the jobs listed:

Mixture (1:2:4) for foundations for machinery; one-course walks, porches, basements and feeding floors; steps and pavements; manure pit floor; septic tanks; bridges and culverts; piers, large posts, suspended floors (reinforced); basement walls exposed to moisture.

A 1:2:3 and a 1:2:4 mixtures are similar, as in each case the mortar is of the proportion 1:2. For thin wall construction or similar light work, the 1:2:3 is generally used, and it is more plastic and more easily worked in the forms.

Mixture for fence posts, clothesline posts and others; wells, cisterns and watering troughs; concrete roofs.

Mixture (1:2½:5) for foundation and floor of silos; building walls above ground.

A 1:2½:4 mixture bears the same relation to a 1:2½:5 as a 1:2:3 bears to a 1:2:4.

Mixture for walls for pits or basements; coal bins, grain bins, silos walls and similar structures.

Mixture (1:3:6) for mass concrete; heavy retaining walls; barn foundations, footings, etc.

Concrete in Winter—Use great care in making concrete during freezing weather. The proper chemical reaction cannot take place when the mixture is frozen. If such work must be done the materials should be heated and allowed to set on only mild pleasant days.

Out
goes
that
pain!

YOU'LL get quick relief from pain with the first application of Gombault's Balsam. It penetrates without blistering, drives out the pain, leaves you feeling fit as a fiddle.

Sprains, bruises, burns, open cuts, deep seated strains, muscular and inflammatory rheumatism, lumbago, sciatica, sore throat and chest colds yield to its healing power with but one or two applications. It's so effective that one bottle lasts a long time.

For forty years Gombault's Balsam has been the one indispensable remedy in thousands of households here and abroad. You'll adopt it, too, once you've had a chance to prove its remarkable healing qualities.

Don't wait till you feel the sting of pain. Get a bottle of Gombault's Balsam today.

Sold by druggists everywhere for \$1.50 per bottle or sent by parcel post upon receipt of price.

GOOD FOR ANIMALS TOO

FOR SALE—Fall and winter apples, sprayed fruit. C. J. YODER, Grantsville, Md.

I Wouldn't Go Back to the Old Times

(Continued from page 263)

thing seem desirable just as the editor said.

I am afraid that these people with whom it is a case of "Turn backward, turn backward, O, Time, in thy flight," really found time turning backward they wouldn't like it. They would probably miss their automobile, telephone, radio, electric lights, furnace and the Dairymen's League.

When we consider just our plain every day living, we can think of many comforts we now have that the homes of fifty years ago could not boast. I think immediately of one special blessing these modern times have brought us farmers, and that is our daily mail delivery. I have heard my mother say that when she was a young girl they usually received their mail only once a week and then they had to drive into town for it.

I think perhaps our telephone should come next in the list, for I know it is one of the farmer's most valued servants. Now we have at our hand the means of instantly calling our doctor in case of illness, or our veterinarian if any of our animals become sick, or in an emergency the State Troopers, or telephone a mail order to a city store. Where do you find such conveniences in the old times? No matter how desperately ill a member of the family might be, the farmer had to drive into the city, often several miles distant, in order to procure a doctor. In many other instances time and labor had to be expended to accomplish business which we may now do with no effort by sitting comfortably at our telephone.

We may also consider our automobiles. Before their day, people drove horses and about the limit a team of horses could go in one day was fifteen or twenty miles. The horses were tired at the end of the trip, and if one had any mercy at all they could not help but pity them. Now we may ride two hundred miles in a day if we wish with an automobile. We have no tired horses to consider and we have accomplished the journey with much greater comfort and pleasure than we could have a much shorter trip by the old, slow way. Automobiles have made it possible for farmers to do their morning chores, take quite a long trip, both pleasant and educational, and return in time for milking at night. It never was possible in the old days to take many trips, for the farmer was tied down to his chores. While it cannot be denied that the misuse of cars has proved a detriment to the human race, the proper use of them has been a blessing.

The radio is rapidly becoming common and probably will be as much in use as the telephone eventually. It will undoubtedly prove to be a great benefit and pleasure to the farmer, particularly in winter when intercourse with the world is necessarily limited on the farm.

We have many comforts now, dear to the souls of every one of us humans. Who would trade their house warmed by furnace heat for one warmed by a fireplace? Fireplaces are undoubtedly artistic, but I have always understood that they made your face burn while your back froze. We also have electricity which lightens both our nights and our daily labors. I wouldn't trade it for candles.

I would like to see the man of to-day who would want to cut his hay with a scythe or do his cultivating with a hoe. In fact, few modern farmers

are even willing to milk by hand. Our modern living has brought many labor-saving devices to lighten the load of both the farmer and his wife.

Finally, we can mediate on the rapid advancement made in medicine and science during the last century which has done much to guard the health and insure the comfort and happiness of the race.

One more thing I think of. Some people seem to think that every generation of people grows more wicked than the preceding one. I believe that there are just as many good people in the world to-day as ever. We see so many discouraging things I suppose that it is no wonder we become pessimistic; but I think we should always remember that we humans have a tendency to give all our attention to noting the bad and failing to observe the good.—I. G. S., New York.

How a Banker Views Farmers' Problems

(Continued from page 262)

by a large appropriation) to conduct a statewide educational campaign, and to send out men, if necessary, to teach the farmer the value of the information, knowledge, aid and service of modern agricultural science, and to enlist the aid of groups or organizations of business men to carry on this work. This movement to enrich the State's farmers and business men would not be at the expense of the city populations. All classes would benefit.

If, by applying the best publicity and sales-management methods, the State Department of Agriculture could "sell" to the farmers its accumulated scientific knowledge, could convince them of the wisdom of cooperation and intelligent, broad-gauge business methods of marketing their products and buying their supplies, and then if those forces could be headed up under skilled direction, the benefits in created and conserved and localized wealth to the whole people of the State can hardly be overestimated.

Such a campaign could be conducted for a fraction of the expense which hundreds of manufacturers incur in their advertising. A score of agencies would lend free and hearty cooperation. Among these I could confidently promise the New York State Bankers' Association. The banker can, as an individual and as a member of the association, support such a program and even help to bring it into being. He can lend his influence to obtain a liberal appropriation. He can help to keep such an appropriation out of the hands of professional politicians and to put skilled technicians in charge.

It must be evident that so far as such a plan is followed under intelligent leadership, just so far the individual farmer profits, the community profits, the consumer profits, and the wealth of the State is conserved. Wealth is not a fixed quantity which no man may acquire except by depriving his fellows; wealth is not something up in the sky to be reached by the fellow with the longest arm. Wealth is created value. And no better example could be cited than in farming, where skill makes unproductive or low productive land yield rich crops which, but for the farmer's expertly applied energy, would never have been added to the world's supply.

The Broad Highway—By Jeffery Farnol

"HOWSOEVER," he continued, "it's a handsome weskit, there's no denyin', an' well worth a woman's lookin' at—wi' a proper man inside of it."

"Not a doubt of it," said I.

"I mean," said he, scratching his ear, and staring hard at the handle of the pitchfork, "a chap wi' a fine pair o' whiskers, say."

"Hum!" said I.

"Now, woman," he went on, shifting his gaze to the top button of his left gaiter, "woman is uncommon fond o' a good pair o' whiskers—leastways, so I've heerd."

"Indeed," said I, "few women can look upon such things unmoved, I believe, and nothing can set off a pair of fine, black whiskers better than a flowered satin waistcoat."

"That's so!" nodded the farmer.

"But, unfortunately," said I, passing my hand over my smooth lips and chin, "I have no whiskers."

"No," returned the farmer, with a thoughtful shake of the head, "leastways, none as I can observe."

"Now, you have," said I.

"So they do tell me," he answered modestly.

"And the natural inference is that you ought to have a flowered waistcoat to go with them."

"Why, that's true, to be sure!" he nodded.

"The price of this one is—fifteen shillings," said I.

"That's a lot o' money," said he.

"It's a great deal less than forty," said I.

"An' ten is less than fifteen, an' ten shillin' is my price; what d' ye say—come now."

"You drive a hard bargain," said I, "but the waistcoat is yours at your own price." So saying, I slipped off knapsack and coat, and removing the garment in question, having first felt through the pockets, handed it to him, whereupon he slowly counted the ten shillings into my hand; which done, he sat down upon the shaft of a cart nearby, and, spreading out the waistcoat on his knees, looked it over with glistering eyes.

"Forty shillin' you paid for 'un, up to Lunnon," said he.

"So you believe me now, do you?" said I, pocketing the ten shillings.

"Well," he answered slowly, "I won't go so far as that, but 't is a mighty fine weskit, an' must ha' cost a sight o' money—a powerful sight!" I picked up my knapsack and, slipping it on, took my staff, and turned to depart. "There's a mug o' home-brewed, an' a slice o' fine roast beef up at th' ouse, if you should be so inclined—"

"Why, as to that," said I, over my shoulder, "I neither eat nor drink with a man who doubts my word."

"Well," said he, twisting his whisker with a thoughtful air, "if you could manage to mak' it twenty—or even twenty-five, I might mak' some shift to believe it—though 't would be a strain, but forty!—no, I can't swaller that!"

"Then, neither can I swallow your beef and ale," said I.

"Where be goin'?" he inquired, rising, and following as I made for the gate.

"To the end of the road," I answered.

"THEN you be goin' pretty fur—that theer road leads to the sea."

"Why, then I'm going to the sea," said I.

"What to do?"

"I haven't the ghost of an idea," I returned.

"Can you work?"

"Yes," said I.

"Can ye thatch a rick?"

"No," said I.

"Shear a sheep?"

"No," said I.

"Guide a plow?"

"No," said I.

"Shoe a 'oss?"

"No," said I.

"Then ye can't work—Lord love me, wheer 'ave 'e been?"

"At a university," said I.

"Why, I don't hold wi' eddication nor book-larnin', myself, master. Here I be wi' a good farm, an' money in the bank, an' can't write my own name," said the farmer.

"And here am I, selling my waistcoat that I may eat," said I. Being come to the gate of the yard, I paused. "There is one favor you might grant me," said I.

"As what?"

"Five minutes under the pump yonder, and a clean towel." The farmer nodded, and crossing to one of the out-houses, presently returned with a towel. And, resting the towel upon the pump-head, he seized the handle, and sent a jet of clear, cool water over my head, and face, and hands.

"You've got a tidy, sizable arm,"

said he, as I dried myself vigorously, "likewise a good strong back an' shoulders; theer's the makin's of a man in you as might do summat—say in the plow or smithin' way. Hows'ever, sir, if you've a mind to a cut o' good beef, an' a mug o' fine ale—say the word."

"First," said I, "do you believe it was forty shillings—yes or no?"

The farmer stared very hard at the spout of the pump.

"Tell 'ee what," said he at length, "mak' it thirty, an' I give ye my Bible oath to do the best I can."

"Then I must needs seek my breakfast at the nearest inn," said I.

"Why, as to that," said he, busy with his whisker again, "I might stretch a pint or two an' call it—thirty-five, at a pinch—what d' ye say?"

"Why, I say 'good morning,' and many of them!" And, opening the gate, I started off down the road at a brisk pace. Now, as I went, it began to rain.

CHAPTER IX

IN WHICH I STUMBLE UPON AN AFFAIR OF HONOR

ISWUNG along the road beneath the swaying green of trees, past fragrant, blooming hedges, paying small heed to the beauties of wooded hill and grassy dale, my eyes constantly searching the road before me for some sign of the "Old Cock" tavern. And presently, sure enough, I espied it, an ugly, flat-fronted building, before which stood a dilapidated horse trough and a battered sign. Despite its uninviting exterior, I hurried forward, and pushed open the door. I now found myself in a room of somewhat uninviting aspect, though upon the hearth a smouldering fire was being kicked into a blaze by a sulky-faced fellow.

"Can I have some breakfast here?" said I.

"Why, it's all according, master," he answered in a surly tone.

"According to what?" said I.

"According to what you want, master."

"Why, as to that—" I began.

"Because," he went on, administering a particularly vicious kick to the fire, "if you was to ask me for the 'ump of a cam-el—being a very truthful man, I should say—no."

"I tell you I want nothing of the sort," said I, "a chop would do—"

"Chop!" sighed the man, scowling.

"Or steak," I hastened to add.

"Now it's a steak!" said the man, shaking his head ruefully, "a steak!" he repeated; "of course—it would be; I s'pose you'd turn up your nose at 'am and eggs?"

"On the contrary," said I, "ham and eggs will suit me very well."

"Why, you never axed me as I remember," growled the fellow.

Slipping my knapsack from my shoulders, I sat down at a small table in a corner while the man went to give my order. In a few minutes he reappeared with some billets of wood beneath his arm, and followed by a merry-eyed, rosy-cheeked lass, who proceeded, very deftly, to lay a snowy cloth and thereupon, in due season, a dish of savory ham and golden-yolked eggs.

"It's a lovely morning!" said I, lifting my eyes to her comely face.

"It is indeed, sir," said she, setting down the cruet with a turn of her slender wrist.

"Which I make so bold as to deny," said the surly man, dropping the wood with a prodigious clatter, "ow can any morning be lovely when there ain't no love in it—no, not so much as would fill a thimble?" With which words he sighed, kicked the fire again, and stumped out.

"Our friend would seem somewhat gloomy this morning," said I.

"Yes," she answered, checking a smile, and sighing instead; "it's very sad, he've been crossed in love."

"Poor fellow!" said I, "can't you try to console him?"

"Why, you see, sir," said she, blushing very prettily, "it do so happen as I'm the one as crossed him."

"Ah!—I understand," said I.

"I'm to be married to a farmer—down the road yonder; leastways, I haven't quite made up my mind yet."

A fine, tall fellow?" I inquired.

"Yes—do 'ee know him, sir?"

"With a handsome pair of black whiskers?" said I.

"The very same, sir, and they do be handsome whiskers."

"The finest I ever saw. I wish you every happiness," said I.

"Thankee sir, I'm sure," said she, and, dimpling more prettily than ever, she tripped away.

And when I had assuaged my hunger, I took out the pipe of Adam, the groom, and, calling for a paper of tobacco, I filled and lighted the pipe, and sat staring dreamily out of the window.

So I sat. And presently, chancing to turn my eyes up the road, I beheld a chaise that galloped in a smother of mud. As I watched its rapid approach, the postilion swung his horses towards the inn, and a moment later had pulled up before the door.

The chaise door was now thrown open, and three gentlemen alighted. The first was a short, plethoric individual, bull-necked and loud of voice, for I could hear him roundly cursing the post-boy; the second was a tall, languid gentleman, who carried a flat, oblong box beneath one arm, and who paused to fondle his whisker, and look up at the inn with an exaggerated air of disgust; while the third stood mutely by, his hands thrust into the pockets of his greatcoat, and stared straight before him.

THE three entered the room together, and, while the languid gentleman paused to survey himself in the small, cracked mirror that hung against the wall, the plethoric individual bustled to the fire, and, loosening his coats and neckerchief, spread out his hands to the blaze.

"A good half-hour before our time," said he, glancing towards the third gentleman, who stood looking out of the window with his hands still deep in his pockets; "we did the last ten miles well under the hour—come, what do you say to a glass of brandy?"

At this, his languid companion turned from the mirror.

"By all means," said he, "though Sir Jasper would hardly seem in a drinking humor."

"No, Mr. Chester, I am not—in a drinking humor," answered Sir Jasper, without turning around.

"Sir Jasper?" said I to myself, "now where, and in what connection, have I heard such a name before?"

He was of a slight build, and seemingly younger than either of his companions, but what struck me particularly was the extreme pallor of his face. I noticed also a habit he had of moistening his lips at frequent intervals, and there was, besides, something in the way he stared at the trees, the wet road, and the gray sky—a strange wide-eyed intensity—that drew and held my attention.

"Devilish weather—devilish, on my life and soul!" exclaimed the short, red-faced man, in a loud, peevish tone, tugging viciously at the bell-rope, "hot one day, cold the next, now sun, now rain. Now in France—ah, what a climate—heavenly—positively divine; say what you will of a Frenchman, but the climate, the country, and the women—who would not worship 'em?"

"Exactly!" said the languid gentleman, examining a pimple upon his chin with a high degree of interest, "always 'dored a Frenchwoman myself; they're so—so—ah—so deuced French!"

"Selby," said Sir Jasper, in the same repressed tone and still without taking his eyes from the gray prospect of sky and tree and winding road, "there is no fairer land, in all the world, than this England of ours; it were a good thing to die—for England, but that is a happiness reserved for comparatively few." And, with the words, he sighed, a strange, fluttering sigh.

"Die!" repeated the man Selby, in a loud, boisterous way. "Who talks of death?"

"Deuced unpleasant subject!" said the other, with a shrug. "Something so infernally cold and clammy about it—like the weather."

"And yet it will be a glorious day later. The clouds are thinning already," Sir Jasper went on; "strange, but I never realized, until this morning, how green—and wonderful—everything is!"

THE languid Mr. Chester forgot the mirror, and turned to stare at Sir Jasper's back, with raised brows, while the man Selby shook his head, and smiled unpleasantly. As he did so, his eye encountered me, where I sat quietly in my corner, smoking my negro-head pipe, and his thick brows twitched sharply together in a frown.

"In an hour's time, gentlemen," pursued Sir Jasper, "we shall write 'finis' to a more or less interesting incident,

THE HERO'S ADVENTURES

PETER VIBART has started to tramp the Broad Highway. His adventures include being robbed of the ten guineas left him by his uncle, seeing the impoverished young gentleman thrown from one roadside inn, and in another meeting Tom Cragg, a pugilist who seems to take him for someone else. Pondering on Cragg's behavior, Peter goes on, getting a lift in a haywain, where he awakes the next morning to find a young farmer casting envious eyes upon his embroidered waistcoat, remnant of better days in London.

and I beg of you, in that hour, to remember my prophecy—that it would be a glorious day, later."

"It's just half-past seven," declared Mr. Chester, consulting his watch, "and I'm rather hazy as to the exact place."

"Deepdene Wood," said Sir Jasper dreamily.

"You know the place?"

"Yes, it will be cool and fresh."

"Settle the bill, Selby, we'll walk on slowly," said Mr. Chester, and, with a last glance at the mirror, he slipped his arm within Sir Jasper's, and they went out together.

Mr. Selby meanwhile rang for the bill, frowning at me all the time.

"What the devil are you staring at?" he demanded suddenly, in a loud, bullying tone.

"If you are pleased to refer to me, sir," said I, "I would say that my eyes were given for use, and that having used them upon you, I have long since arrived at the conclusion that I don't like you."

"An impertinent young jackanapes!" said he; "I think I'll pull your nose!"

"Why, you may try, and welcome, sir," said I, "though I should advise you not, for should you make the attempt I should be compelled to throw you out of the window."

At this moment the pretty maid appeared, and tendered him the bill with a curtesy. He glanced at it, tossed some money upon the table, and turned to stare at me again.

"If ever I meet you again—" he began.

"You'd probably know me," I put in.

"Without a doubt," he answered, putting on his hat and buttoning his be-

(Continued on page 273)

Comfort

OLD folks, like little ones, require a constant, easily tempered heat—you might almost say a flexible heat is absolutely necessary for their health and comfort.

Yet making a bigger fire in the furnace means over-heating the rest of the house. Even when the particular room is hot enough for Grandpa and Grandma, you can't very conveniently turn the furnace lower, and reduce the heat elsewhere. But a Perfection Oil Heater furnishes portable, yet flexible warmth. It will quickly and economically heat the particular room that you want, and young as well as old will enjoy its genial and comfortable presence.

Your nearest dealer
will gladly demonstrate.

When Bedtime Comes

The Best Hour of the Day For Small Confidences

BEDTIME for the children.

It seems as if mother has just dropped wearily into her comfortable chair. "Run along upstairs now and see if you cannot put yourselves to bed," she suggests.

"Course we can," they chorus.

"I'll help little Mary," Jane offers magnanimously.

"I can unbutton my own self," Mary avers.

They are dear, trooping reluctantly up the stairway after innumerable drinks of water and repeated good-night kisses. "Isn't it a little lonely when the children get big enough to 'put themselves to bed'?" someone suggests. But mother smiles knowingly.

"Mother," a voice presently proclaims from above, "I can't unbutton my waist."

"Let sister help you, Mary."

"Mother, my shoe strings are in a hard knot. And Mary will not say her prayers to me!"

"Well, try once more, Jane."

"Mother, there's a cut on my finger. It looks pretty bad."

"All right, John." Mother goes upstairs.

"Isn't that a shame," someone exclaims. "Why didn't she firmly refuse? There is no sense in a mother sacrificing herself to spoil her children!"

Upstairs, mother tucks little prayer-repeating Mary safely under her blankets. "Mother, shall you be near all night?" questions Mary, who has much more confidence in mother's presence than in the care of any higher omnipotence.

"I'll be near," she promises with one last kiss.

Small Troubles are Told

The knots in the shoe laces were not really very hard. "Oh, mother, to-day Lena told me—" Mother listens to the little confidence. She makes a sim-

ple explanation of what had seemed an alluring mystery and leaves a loving impression in place of what might have been an ugly scar.

The cut finger did not look alarming upon close inspection. But there is a deeper hurt. Two of the boys are getting perfect marks on their arithmetic—not quite squarely—and John can 'get in on it.' It's pretty tough to get lower marks all the time!

Mother, coming downstairs presently, is thinking. Of little Mary, peaceful and safe. Of Jane's budding mind still sweet and childlike. Of John already facing some of a man's problems. She has read that great psychologists claim that our last waking thoughts and impressions sink deepest into our subconscious minds and make the most lasting impressions upon our characters and lives.

What an unspeakable privilege it is for a mother to put her children to bed! What a mistake to look upon it as one more duty at the close of a long, hard day!

She has no intention of making mollycoddles of her son and daughters. But she does pray that they may never get too big for these occasional precious confidences at bedtime.—ALICE MARGARET ASHTON.

OUR PATTERN ANNUAL

The Fall and Winter Fashion Magazine is a "best seller" if ever there was one! It ought to be, for we really can't remember when such a book included more unusual features. In addition to the modern styles for all members of the family which are illustrated, it has sewing helps, embroidery designs and explanations of difficult stitches. All this for ten cents a copy! Just add five two-cent stamps to your pattern order and the catalogue will go forward at once.

CHOOSE YOUR NEW PATTERN HERE

Blouse
1901
SKIRT
1157
Emb 670

THE knee-length blouse is fashion's latest decree. **No. 1901** cuts in one piece and may have either short or long sleeves. A touch of gay embroidery adds charm.

No. 1901 comes in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 2½ yards 36 or 40-inch material. **Pattern 12c.**

Skirt pattern **No. 1157**, in the same picture, cuts in sizes 26, 28, 30 and 32 inches waist measure. For the 28 inch size, use 1½ yards 54-inch material. **Pattern 12c.** Embroidery pattern **670** is **12c extra.**

THE diagram of **No. 1821**, a dress for the school-age girl, shows how easy it is to make. The pattern cuts in sizes 4, 6, 8, 10, 12 and 14 years. Size 8 requires 1½ yards 36-inch material, with ¾ yards ribbon. **Pattern 12c.**

No. 1852 is a sleeveless jacket, the very thing for sport wear, or to slip on under a suit coat. Made of bright red or green sport flannel, it is both smart and warm. **No. 1852** comes in sizes 16 years, 36, 38, 40 and 42 inches bust measure. Size 36 takes 1¼ yards 40-inch material. **Pattern 12c.**

Under the jacket is shown blouse **No. 1277** which comes in sizes 36, 38, 40 and 42 inches bust measure and requires 2 yards 36-inch material. This pattern is **12c.**

A NEAT and attractive house-dress adds much to the comfort of the housewife who must spend a great deal of time in her kitchen, yet be ready in case a neighbor drops in unexpectedly. **No. 1469** fills the bill admirably. It cuts in sizes 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires 3¾ yards 36-inch material, with ¾ yard 36-inch contrasting. **Price 12c.**

To Order: Write name, address, pattern numbers and sizes clearly, enclose twelve cents in stamps for each pattern ordered and send to Fashion Department, American Agriculturist, 461 Fourth Avenue, New York City. Our patterns are seam-allowing and fit perfectly. A bewildering variety is shown in our brand new Fall and Winter Fashion Magazine which is only ten cents a copy. Ask for it when you order your patterns.

Looking Forward to Halloween

The Easiest Sort of a Party to Have—And the Most Fun

A HALLOWEEN party is always enjoyed because it is the most informal sort possible. A hostess who sends invitations should decorate them with a Jack-o-lantern, a black cat, an apple, a bat, or a witch, all symbols of the season.

A row of welcoming Jack-o-lanterns should be suspended over the entrance to the home where the guests assemble at the stated hour. Several Jack-o-lanterns bobbing about the lawn and porch should be the only light to lead them through a dark hall into a lighted room.

The rooms may be draped with pumpkin-colored cheesecloth, and decorated with pumpkin receptacles, filled with golden rod, asters, autumn leaves and ferns. Also have shocks of corn in the corners of the room with pumpkins heaped around the base. It is better to take up carpets or rugs and remove all ornaments and unnecessary furniture.

The games may all be simple, but nevertheless cause much amusement. Have a "Pumpkin Plentiful" presided over by a girl dressed as a witch, who urges guests to reach in and grasp their fortunes. This large pumpkin shell should be filled with small articles which are supposed to suggest the future to those that draw them. Another pumpkin is presided over by "Peter Piper," but instead of keeping only one wife in a pumpkin shell, he keeps a number, which prove to be gingerbread and doughnut dolls, which soon disappear with cider, from a huge pitcher or jug.

All the Old Games—and Some New Ones

All the old-fashioned apple games may be indulged in and new ones also. One old Scottish test will cause much merriment. Suspend by a string from the ceiling a crosspiece of wood; on one end place an apple, on the other end fasten a sponge, which should be dipped in soot. A weight should be attached to the end that holds the sponge, so that it will balance with the apple. The guests try to take a bite out of the apple without getting any soot on their faces. Those successful will be married before another Halloween, but those that have soot on them are doomed to go single another year at least. This is a variation of the old apple-biting contest, which may also be enjoyed.

Then arrange for an apple-gathering contest which resembles a potato race. Twelve apples should be arranged at regular distances in two rows and the company divided into two sides. One person at a time from each side, armed with a tablespoon, should try to pick up his apples in his spoon, carry each to the basket at the head of the row, and return for another. The side which scores the most winners is presented with a basket of fine apples, which are passed around and eaten. Other refreshments consist of baked apples with whipped cream, fresh made doughnuts, chicken and nut sandwiches and little fancy made Halloween cakes.—H. A. LYMAN.

The Broad Highway

(Continued from page 271)

frogged surtout; "and should you," he continued, drawing on his gloves, "should you stare at me with those impertinent fishes' eyes of yours, I should, most certainly, pull your nose for you."

"And I should as certainly throw you out of the window!" I nodded.

"An impertinent young jackanapes!" said he again, and went out, banging the door behind him. Glancing from the window, I saw him catch up with the other two, and all three walk on together down the road. Sir Jasper was in the middle, and I noticed that his hands were still deep in his pockets. Now, as I watched their forms getting smaller and smaller in the distance, there grew upon me a feeling that he who walked between would nevermore come walking back.

And, in a little, I called for and settled my score. As I rose, the pretty

chambermaid picked up my knapsack from the corner, and blushing, aided me to put it on.

"Do you think I have fishes' eyes, my dear?" I asked her.

"La! no, sir—handsome they be, I'm sure, so bright an' black an' wi' little lights a-dancing in them—there, sir, go along wi' you!"

"By the way," I said, pausing upon the worn steps, "how far is it to Deepdene Wood?"

CHAPTER X

WHICH RELATES THE END OF AN HONORABLE AFFAIR

SOME half-mile along the road, upon the left hand, was a stile, and beyond the stile, a path—a path that led away over field, and meadow, and winding stream, to the blue verge of distant woods.

Now, midway between these woods and the place where I stood, there moved three figures; and, far away though they were, I could still make

out that the middle one walked with his hands—those tremulous, betraying hands—thrust deep within his pockets.

And presently I climbed the stile, and set off along the path.

"Sir Jasper!" said I to myself. Somewhere in the background of my consciousness I had a vague recollection of having heard mention of such a name before.

"Sir Jasper!" said I to myself again. "It is a very uncommon name, and should be easy to recollect." So I walked on through the sweet, wet grass, racking my brain.

When I again looked up, the three figures had vanished where the path took a sharp bend round a clump of oaks, and, determined not to lose them, I hurried my steps; but when I, in turn, rounded the corner, not a soul was in sight.

(To be continued)

A pan which contains a thin layer of sand placed in the bottom of the oven prevents food from scorching.

45¢ Quality-Rich Flavors

COFFEE

Fresh from Roaster Daily

A BLEND of the best high grown mountain coffee with a tantalizingly fragrant aroma and a highly appetizing and satisfying flavor that will delight the most particular person. Reviewing the Latest Eastern Markets and Prices

THE APPLE MARKET TO DATE

HERSCHEL H. JONES

ONE of the Produce Trade papers recently described the apple market as "in the doldrums," which "hits it" about right. Reports from the Rochester section, from Pittsburgh, from Boston, from Philadelphia, and all the large eastern markets have been about alike for the last week or two. The New York market has shown a higher general range of prices than most of the other markets, except for baskets of certain varieties in a few instances, but all the markets have been oversupplied with ordinary or average quality fruit.

If any man doubts that the way to get good prices and make money out of apple growing is to grow good fruit, let him pay a visit to the New York market from midnight to 8 A.M. at this time of year. For very fancy apples there is always a buyer who is willing to pay premium prices. For the average quality stuff, it is ten times as much work to sell them at prices that hardly pay the grower for packing them. Last week, for example, some really fancy McIntosh grown with the most modern methods and packed as fancy fruit should be, sold at \$10 per barrel, while other apples from the same part of the country and from trees that took up just as much room and in packages that cost almost as much, moved very slowly at \$2.50 per barrel.

The New York market has been glutted with B Grade and unclassified apples of the cooking varieties, both barreled and in bulk. Pie bakers and restaurants have been the chief consumers.

Most of the A Grade apples of keeping quality have been going into storage. The supplies of boxed apples have been heavy, also barrels from the South.

The October 1 crop estimates shows an astonishing increase in the production of apples in New York State and Maine.

The October 1 crop estimates of the United States Department of Agriculture show about a million barrels less of commercial production of apples in New York State than was estimated September 1.

Following wholesale prices represent the range on dock and wholesale market sales at New York last week for New York States and Hudson River apples: McIntosh, per barrel, \$4 to 8; Wealth, per barrel, \$2.50 to 6; Fall Pippin, per barrel, \$3 to 5.50; Wolf River, \$2.50 to 5.50; King, \$3 to 5; Twenty Ounce, \$2.50 to 5.50; Greenings, \$3 to 7.50.

BIG INCREASE IN POTATO YIELD

The government estimate of the potato yield as of October 1, shows an increase over that of September 1 of nearly 12,000,000 bushels. But the most significant point for eastern growers is that over 10,000,000 bushels of this increase comes from only three States, New York, Pennsylvania and Maine. The estimated yield for these three States is now over 1,000,000 bushels greater than their yield last year, although the total for the country as a whole is 50,000,000 bushels less. If this estimate is sustained by the final returns it appears that there will be an abundance of potatoes for New York and other nearby eastern markets.

The market in New York continued weak with little demand. Most of the potatoes sold now are Maines, which are bringing, for Cobblers \$2.50 to 2.75 and Green Mountains \$2.90 to 3.15 per 150-pound sack. Long Islands on October 11 were quoted at \$3.50 to 3.75 per 150-pound sack. Dull markets are reported from practically all large receiving points.

BUTTER MARKET STRONG

The Federal report on butter holdings throughout the country on October 1 showed that the September shortage had been cut down over 8,000,000 pounds, making total holdings 95,673,000 pounds. The elimination of this shortage caused a sudden drop in prices. But this drop has been overcome by unexpected strength in the market so that prices on October 11

were actually higher than the previous week.

Increase in September production is reported as largely responsible for the disappearance of the butter shortage. Consumption, however, has continued very satisfactory and operators feel the condition of the market is sound.

HIGH PRICES ON FANCY EGGS

Intermediate grades of eggs showed the first improvement in weeks with a slight decrease in shipments. The demand was still far from strong on October 11, however, when fresh gathered eggs mixed with held eggs brought from 28 to 33 cents. In contrast high grades of eggs continued to advance. Nearby hennery white extras brought from 72 to 75 cents per dozen, while Pacific Coast white extras

of 8,000,000 bushels from the estimate for September 1 did not have so much influence as the fact that the yield of high quality bread grain in the three northwestern States is less than needed for domestic consumption. Corn prices advanced at a more rapid rate, than wheat. The influence of these two grains caused oats likewise to move upward.

Cash grain quotations on October 11 were as follows:

New York—WHEAT, No. 2 red, \$1.26½; CORN, No. 2 yellow, \$1.25½; No. 2 mixed, \$1.24½; No. 2 white, \$1.25½; OATS, No. 2 white, 54 to 54½c; No. 3 white, 53 to 53½c; ordinary white, clipped, 56½ to 57½c; RYE, 80½c; BARLEY, 76 to 78½c.

Chicago—WHEAT, No. 2 red, \$1.11½; CORN, No. 2 white, \$1.07 to

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on October 12:

Eggs, Nearbys (cents per dozen)			
New Jersey hennery whites uncandled, extras...	74 to 76
Other hennery whites, extras.....	72 to 75
Extra firsts.....	61 to 65	55 to 58	42 to 44
Firsts.....	54 to 60	38
Gathered, whites, first to extra firsts.....	54 to 63
Lower grades.....	40 to 51
Hennery browns, extras.....	55 to 60
Gathered browns and mixed colors, extras.....	50 to 54	49 to 52
Pullets No. 1.....	35 to 49
Butter (cents per pound)			
Creamery (salted) high score.....	48 to 48½	50 to 51
Extra (92 score).....	47 to 47½	48 to 49	48
State dairy (salted), finest.....	45½ to 46½	46 to 47
Good to prime.....	43 to 45	39 to 44
Hay and Straw, Large Bales (per ton)			
Timothy No. 2.....	\$28 to 29	\$17 to 18	\$26 to 26.50
Timothy No. 3.....	26 to 27	22 to 23
Timothy Sample.....	17 to 21
Fancy light clover mixed.....	30	26 to 26.50
Alfalfa, second cutting.....	31 to 32

Live Stock (cents per pound)			
Calves, good to medium.....	11½ to 15
Bulls, common to good.....	3½ to 4
Lambs, medium to good.....	11 to 13
Sheep, common to good ewes.....	3 to 4½
Hogs, Yorkers.....	8½ to 8¾

sold at 66 to 70 cents. A shortage of Pacific Coast eggs continues due to high prices in the West.

CHEESE MARKET WEAKENS

No doubt the Federal report on storage holdings which showed storage stocks this year to be 13,500,000 pounds greater than last year was the principal factor in causing a weakness in the cheese markets. Prices on State flats have declined ½ to 1 cent per pound, on the New York market. In spite of this decline at primary markets, holders of cheese were not inclined to lower asking prices. Another factor in affecting the cheese situation has been the declining markets in Canada and Great Britain.

BETTER DEMAND FOR BROILERS

An increasing demand for broiling chickens made itself felt on the market last week. On October 11, colored chickens brought 24 cents for best grades. The market on colored fowls continued steady.

HAY PRICES FIRM

The hay market continued strong with prices on No. 2 ranging from \$29 to \$30 per ton. There is no timothy on the New York market of No. 1 quality.

LIVESTOCK SUPPLIES LIGHT

Very light receipts of live calves during the week created a firm market and some fancy veals brought as high as \$16 to 16.50 on October 11. Live sheep and lamb supplies were likewise light, medium grades bringing \$13 to 14.50. Stocks of country dressed calves were pretty well cleaned up in anticipation of the holiday October 12.

GRAINS SHOW SHARP ADVANCE

Grain markets have shown sharp advances under the influence of Federal crop estimates. On wheat the loss

1.09; No. 2 yellow, \$1.07 to 1.10; No. 3 yellow, \$1.07; OATS, No. 2 white, 43¾ to 47½c; RYE, 73½ cents; BARLEY, 62 to 74 cents.

The Holstein-Friesian Association of America has just announced that the only cow in the world to make three yearly records, each over 30,000 pounds of milk and 1,000 pounds of butterfat in one year, is Adironda: Wietske Dairy Maid. In three years she produced 97,882.6 pounds of milk and 3,186.61 pounds of butterfat.

Dairy Show High Lights

(Continued from page 266)

world will take back to their own countries about American dairy cattle and American dairymen. These delegates have been in the country for weeks and have been across the nation to California. They are now taking trips around the eastern United States, all of the time studying our dairying business.

A friend of mine asked one of them what was his leading impression of the United States, and the foreign delegate said: "So beeg, so beeg, I no can grasp it."

After visiting the show at Syracuse and seeing the cattle judged in the great Coliseum, which was just finished, these delegates came to Ithaca where the new Dairy Building in the College of Agriculture was dedicated on Saturday morning. While standing by the side of a delegate from the government of Switzerland in this beautiful building, the finest and most up-to-date dairy educational building in the world, I asked him what he thought of his trip to America, and he said:

"The people of Europe have always looked upon the United States as the land of opportunity. After this trip,

I fully understand why. You Americans do not realize what you have. Speaking of both living conditions and opportunities as compared with those of any other nation in the world, America is just heaven—just heaven."

Hold Hay or Sell Now

(Continued from page 267)

price. If you have U. S. No. 2 you obviously will get more money than if you have U. S. No. 4. It may be that the hay buyers are quoting you just what your hay is worth. Why not consult your county agent and ask him to give you an estimate of the grading of your holdings. If you have U. S. No. 2, the hay buyers are offering you less than the average. Our correspondents report through county notes, that hay buyers are offering anywhere from \$15 to \$18 a ton for good No. 2 hay.

No one can say whether the price of hay is going to go up by spring or not, however, indications are that the hay market this winter is going to be strong due, as previously stated, to conditions in the field. If you have a sufficient amount on stock, and you are financially able to do it, it wouldn't be a bad idea to press up and sell part of your hay, holding the rest and speculating on the spring market. Of course, this all depends upon your own personal financial conditions.

Color Your Butter

"Dandelion Butter Color" Gives that Golden June Shade and Costs Really Nothing

Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade to bring you top prices. "Dandelion Butter Color" costs nothing because each ounce used adds ounce of weight to butter. Large bottles cost only 35 cents at drug or grocery stores. Purely vegetable, harmless, meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Tasteless.

Two Factors That Identify Laying Hens

C. E. LEE

NO poultryman to-day can be really successful without continually culling his flock. Among the many factors to be considered when culling for egg production, recent investigations have shown that more emphasis should be placed on the condition of the vent and abdomen.

As a hen comes into full egg production there is a general softening of the tissues around the vent. In the heavy layer the vent will appear large, moist, soft and of an oval shape. The upper part will overhang the lower and the color will be white, if free from manure stains. Under heavy production the vent will be somewhat bruised and the interior often shows distinct black and blue spots under extremely heavy production.

The poor layer, on the other hand, will show a relatively small dry and puckered vent of a round, rather than oval, shape. The upper part will not be overhanging and the whole vent will be distinctly contracted, with no indication of bruising either on the exterior or interior. The color will be a shade of yellow, varying with the degree of nonproduction, the time since production, the yellow corn fed and the green range available.

Condition of the Abdomen

Much the same condition is found in the abdomen. Under heavy production more food is consumed and the digestive system is greatly distended. Both the digestive and reproductive systems then are more active under high production.

The heavy layer will have a large abdomen with soft pliable skin, hanging rather loosely so that it is easy to get a fair handful of it by grasping the abdomen directly in the rear below the vent. If fat is present it should be soft and there may be some sagging of the abdomen, but not due to an accumulation of hard fat.

Care should be taken not to confuse the healthy bird with the internal layer, which for one of several possible reasons may form eggs regularly, but retain them in the body cavity instead of laying them. Such a bird will usually show heavy yellow pigmentation, especially in the eye ring, beak and eventually in the shanks, while the comb is usually purplish. The abdomen may be soft but usually much bagged down with the retained eggs.

Non-Layer Looks Like Sick Bird

The non-layer has a hard, tight tucked up abdomen which is deeper yellow in color as the bird continues in the non-laying condition. A sick bird will show the same contracted condition of the abdomen, but the skin will be white and thin with no hard fat and a generally emaciated appearance quite different from that of the healthy bird.

In all culling it is necessary to take many points into consideration. Pigmentation, especially in beak and legs, the condition of the molt and body type all deserve attention.

The day of culling by the Hogan or "finger test" and other similar methods which consider only one or two factors is as definitely past as the day of the "one-lung" automobile.

American Fence

The protector of American Farm Property for over 25 years. The standard of quality wherever the best is none too good. Five million farms are now fenced with American Fence. The annual value of the stock and crops it safeguards represents many billions of dollars.

Farmers have found that full gauge steel—full length rolls and long life galvanizing mean true economy in fencing.

Ask your dealer for American Fence.

The only original and genuine.

Help your MOULTERS MOULT

If you want your hens to moult naturally—

If you want them back on the egg job promptly—fall and winter laying—

Then you must make sure that your moulters are healthy and hungry.

They must eat lots, and be able to digest what they eat.

That's just what

Dr. Hess Poultry

PAN-A-CE-A

does for your moulting flock.

It's a tonic that begins with the appetite—improves a hen's whole system.

It has Iron that keeps the paleness away, makes the combs and wattles red—the blood rich.

Pan-a-ce-a starts the food the egg way as soon as the moult is over.

No time lost.

No dormant egg organs after the moult, where Pan-a-ce-a is fed.

Tell your dealer how many hens you have. There's a right-size package for every flock.
100 hens, the 12-lb. pkg. 200 hens, the 25-lb. pail
60 hens, the 5-lb. pkg. 500 hens, the 100-lb. drum.
For fewer hens, there is a smaller package.

GUARANTEED

Questions and Answers on the School Bill

Socrates Said That Questions Bring Out the Truth

WHAT is the purpose of the rural-school bill?
 Its purpose is to provide a system of taxation and administration which will enable the poorest districts of the State to give their children as good school advantages as are provided in the richest districts.

TAXATION AND THE COMMUNITY DISTRICT

Q. 2. How can these advantages be provided?
 A. By equalizing taxation in support of the schools.

Q. 3. How would taxes be equalized?
 A. In two ways; first, by a larger local unit of taxation and second, by State aid.

Q. 4. What is the plan for the larger local unit of taxation and administration?

A. A number of school districts that form a natural community unit would be grouped together and would form the local unit of taxation and administration.

Q. 5. What name is given to this local unit of taxation?

A. The community district.

Q. 6. Would every taxpayer in the community district pay the same rate of tax?

A. Yes.

Q. 7. How would the State aid in equalizing taxation?

A. It has been estimated that three hundred thousand dollars of taxable property is necessary to produce a tax sufficient for one teacher. Any community district having less than this amount would receive from the State the proportion of its school expenses necessary to make up this difference for each teacher employed. The State would contribute also toward the construction and repair of buildings.

Q. 8. How would the State tax be raised?

A. By some form of State-wide tax.

Q. 9. What part of the State aid would be paid by rural people?

A. About one-eighth of the whole amount.

Q. 10. What part of the total amount thus raised by State tax would go to the rural district?

A. The whole of it. The rural districts would receive about \$8 in State aid for every dollar that they paid toward this aid.

Q. 11. Will taxes be increased under this bill?

A. In some districts they might be slightly increased; in many rural districts they would be decreased.

Q. 12. In what districts might they be increased?

A. In those districts that have a very low tax rate under the present system, such as those that have the railroads and other corporations to pay their taxes. These districts would have nothing to fear, however, for the State aid would prevent their taxes being greatly increased.

Q. 13. Are there some very rich rural districts?

A. Yes. Some one teacher rural districts have several hundred thousand dollars valuation. A few have more than a million dollars valuation.

Q. 14. In what districts will taxation be decreased?

A. In the large number of outlying districts that have no or very little corporation property to pay their taxes.

Q. 15. Is the primary purpose of the bill to reduce taxation?

A. The primary purpose of the bill is to provide good schools for all rural children at a cost that will not burden any of the taxpayers.

Q. 16. Would the proposed plan do this better than the present system?

A. Yes. The present system is very unfair to rural taxpayers and to rural pupils.

CONSOLIDATION NOT REQUIRED

Q. 17. Does the bill compel schools to consolidate?

A. No. Schools cannot be consolidated without a majority vote or a majority petition of the voters of each district.

Q. 18. Is there anything in the bill intended to bring about compulsory consolidation?

A. No. There is nothing concealed or hidden in the bill that would compel school consolidation or make it necessary without the consent and desire of the people.

Q. 19. How may schools be consolidated under the present law?

A. Schools may be consolidated by consolidating districts. Districts may be consolidated by vote of the people or by order of

Your Problem

FOLLOWING the several explanatory articles on the Rural School Bill that have recently appeared in *American Agriculturist*, we are getting at the explanation in another way, by answering questions. After you have read the articles that have appeared and these questions and answers, if you have any further questions on this important subject, we will be glad to answer them either by mail or, if space allows, in future issues of *American Agriculturist*.

We want to do our part toward getting the information about this bill before you. After you have the facts, the final judgment is entirely up to you. The judgment of a majority of farm people never yet went very far wrong on any important problem.—The Editors.

the district superintendent without the vote of the people.

CONDEMNATION OF SCHOOL BUILDINGS

Q. 20. How would school buildings be condemned?

A. By order of the district superintendent approved by the intermediate board of education.

Q. 21. How are school buildings condemned under the present law?

A. By order of the district superintendent acting alone.

THE COMMUNITY BOARD OF EDUCATION

Q. 22. How would the schools be administered?

A. By the community board of education.

Q. 23. What is the community board of education?

A. A school board in the community district composed of at least one representative from each school district chosen as at present by the voters of that district.

Q. 24. What power would the community board have?

A. All powers at present held by school district trustees and boards of education.

Q. 25. Does this mean more school officers?

A. The present trustee would act as a member of the board of education in managing the schools instead of acting alone as he does now.

HIGH-SCHOOL ADVANTAGES

Q. 26. Would high-school privileges be provided for all rural children?

A. Yes.

Q. 27. Who would pay for the transportation of children to high school where transportation is necessary?

A. The community district and the State.

Q. 28. Could each community district have a conveniently located high school?

A. Yes.

Q. 29. Is it right to provide high schools for all rural pupils who desire to attend them?

A. Yes, rural boys and girls should have

the opportunity to go to high school the same as city boys and girls now have.

Q. 30. Would not high schools increase the cost of schools greatly?

A. No, the plan for equalizing taxation would take care of that.

THE INTERMEDIATE BOARD OF EDUCATION

Q. 31. What is the intermediate board of education?

A. A board of education in the supervisory district composed of one representative from each community board in the supervisory district.

Q. 32. How would the members of the intermediate board be chosen?

A. Each community board would elect one member.

Q. 33. What would be the duties of the intermediate board?

A. They would elect the district superintendent, fix his salary and act with him in managing the schools.

Q. 34. Would this be creating new officers?

A. No, the intermediate board would take the place of the present board of school directors, but would have more duties as representatives of the people than the board of directors has.

TRANSPORTATION

Q. 35. Would small children be transported long distances without the consent of the voters?

A. No. Transportation of small children would be unnecessary unless schools consolidate and schools could not be consolidated unless a majority were in favor of it in each district.

COUNTY AND STATE COMMISSION

Q. 36. What is the county commission?

A. A temporary commission of four members appointed by the board of supervisors in each county to represent the people in establishing the community districts.

Q. 37. Would this commission have anything to do with the management of the schools?

A. No.

Q. 38. Would it continue in office after completing its work?

A. No.

Q. 39. Would it receive pay for its work?

A. Yes a limited amount fixed in the bill.

Q. 40. If commissions were not appointed what officials would be expected to establish the community districts?

A. Probably the Commissioner of Education and the district superintendents.

Q. 41. What is the reason for having county commissions to establish community districts?

A. To give the people a large voice in their establishment through their representatives chosen for the purpose.

Q. 42. What is the State Commission?

A. A commission of three consisting of the commissioner of education, two persons who live in the rural districts, appointed by the governor to provide plans for establishing the community districts, to decide appeals, and when disputes over boundaries and other questions arise and to determine the number of supervisory districts necessary in the State after 1926.

MISCELLANEOUS

Q. 43. Does not the bill centralize control over the schools in the State?

A. No, in many matters the people are given more local control.

The Real Trouble With Agriculture

A WEA F and American Agriculturist Wednesday Evening Radio Talk

MUCH is being said these days about helping agriculture out of the difficulty it is in these last years. The implication seems to be that the trouble is only temporary and that if some adjustment can be made to relieve the present situation, all will be well.

This is a very superficial view of the matter. The real trouble with agriculture lies very much deeper and will take definite and comprehensive changes in some general policies to put agriculture back on its feet again. This will influence the young people who know the business by growing up in it to choose it as a life work and enable those who are now farmers to go on the markets and buy the labor needed to reduce the working hours on the farm to what is customary in other callings.

Ever since the Civil War, this country has given its most earnest thought to the development of its industries and the laws of the last half century, State and national, have in a large measure tended to encourage industry.

For instance, in Pennsylvania nearly a half century ago we made a tax system which gave to the capital stock of manufacturing corporations an exemption of several billions of dollars of property, well able to pay its full share of tax, a privileged class. Whenever one class of property is exempted from participation in the cost of government the other classes, or the one selected as the goat, must assume the load taken off the privileged class. Many States have done as Pennsylvania in varying degrees.

Our tariff schedules in all tariff bills have given advantage to industry at the expense of agriculture. Agriculture cannot on the main staples take advantage of a tariff, because we constantly export and sell our surplus in the world market. The balance of the crop brings what the surplus will sell for, plus the cost of transportation.

During the latter part of the last century when we had many undeveloped industries, there was some argument to giving advantage to those who labored to build up production in industry even though Agriculture did suffer somewhat as a result. Since 1900, this argument has been destroyed because no one will claim that our giant combinations

By JOHN A. McSPARREN

Master of the Pennsylvania State Grange

and corporations need any longer any special privileges. On the other hand, the imposition, which as a result of this policy has been heaped on agriculture, is sapping its life blood to such great extent that armies of farmers are leaving the farms and few young people are choosing the business as a life work. The time is here when we must encourage agriculture.

No one expects other business to suffer

on the staples, but an export bounty. He can then sell his surplus on the world's market at the world's price and sell what is needed for home consumption at a price stimulated by the amount of the export bounty. I believe a better way to get the equality needed would be to make the people who manufacture the things the farmer has to buy, sell on the same market he has to sell on, namely, the world's market.

The wheat and cotton farmer sells these world staples at the world's price and buys shoes and clothes in a market absurdly stim-

ulated. The farmer could clothe his family much finer for the money spent if he could buy in the same kind of market in which he is compelled to sell.

Big business is urging very strongly these days for the government to get out of business and stay out. I shout "Amen" if the government will stop making artificial markets for the very people who are asking the government to get out of business. Will these people actually agree for the government to get out of business. The last tariff bill does not indicate that they have made any such demand. It will be a glorious day for agriculture when the govern-

ment does what government was originally supposed to do, give every one an equal opportunity before the law.

Some of our bankers have joined the cry for the government to get out of business. But how about the government allowing the banker to take a United States bond and draw his interest the same as any other holder of a government bond and then take it to the Treasury of the United States and deposit it and carry away one hundred cents on the dollar less the cost of printing in new money. Now he is allowed the same privilege with commercial paper. Will the banker agree that the government shall get out of business and have the fiat money we need to keep the circulating medium up to the just standard issued, not by him, but by the government in lieu of taxes? I doubt it.

It seems to be a general trouble in the States to have all kinds of property pay their just share of the cost of government. Agriculture has suffered in this particular, tremendously because real estate is never

(Continued on page 290)

Here is one reason for the present situation in the wheat belt, wheat as far as the eye can see, more than the world demands, millions of bushels that were dumped on the market at the same time creating a market glut

disadvantages in order that agriculture should again flourish, but it certainly can be expected of an intelligent people that to encourage a business that is essential to the welfare of every other occupation, everybody would be willing to accord it a square deal and an equal chance with other lines of work.

What built up our industry was not the super-intelligence or super-thrift of those who engaged in manufacturing, but the government, by means of tariff laws, enabled the manufacturer to sell his surplus, if he had any, at the world's price and to sell the balance of his output in a home market which was stimulated by the amount of the tariff imposed on the importation of the commodity he manufactured. The farmer was the big buyer of those artificially priced materials and suffered by that much in his purchases. Simple fairness now requires that if we are to continue the policy of stimulating the market of the manufacturer by artificial means, then we should do the same thing with the farmer and give him, not an import duty which means nothing to him

The Apple Show

HAVE you written your New York City friends about the eastern States Apple Exposition? You know this is to be held in the Grand Central Palace, New York City, November 3-10. Without question it will be the largest fruit show ever seen in New York City and probably in the East. Its purpose is to advertise and increase the consumption of eastern grown apples and other fruits.

Plans are being made to make this show a regular fairyland of fruit. It will be well worth anybody's trip to New York City to see it; but if you cannot come you can at least get a friend to come. If that friend is a city resident, so much the better for the city folks are the ones upon whom we depend for our markets.

Our New Dairy Building

THE farmers and dairymen of New York State may well be proud of the new dairy building at the State College. The cornerstone of this building was laid on March 3, 1922, and it was dedicated on October 13, 1923. It contains 83,000 square feet of floor space and is equipped with all laboratories, cold storage plants and machinery necessary in teaching and studying one of the greatest and most important industries.

Many of the delegates from the forty foreign countries attending the World's Dairy Congress were present when the college dairy building was dedicated and several of them said that without question this building and its equipment was the best for its purposes in the world.

In his dedication speech, Dean Mann said: "The adventure of building a democratic commonwealth finds its chief security in widespread education, sound, general education for the masses, higher and perhaps specialized education for those who are to become leaders, teachers and carriers of responsibility. For America to fortify its democratic ideal, it must have on the land an educated competent body of citizens trained for productive usefulness in the art of farming and schooled in the ideals of the nation. . . . If

agriculture and country life are to reach an estate commensurate with the highest permanent welfare and integrity of the commonwealth and the nation, institutions to serve agriculture especially in the discovery and promotion of knowledge must be brought to high development."

The Dean emphasized the thought that the State colleges of agriculture were the property of the common people and that without the sympathetic support of the men and women back on the land, no State college could be worth while. He then concluded by saying:

"Perhaps this can all be summed up by saying that the whole function of the State college is to make straight and clear the way for the liberation of the spirit of the man who works the land from whatever tyranny of time, place or condition there may be, not by running away from his task, but by mastering it."

Cornell Has New Dairy Chief

THE New York State College at Ithaca starts work in its new dairy building with the announcement that Dr. James Morgan Sherman of the Dairy Division in the United States Department of Agriculture is to be the head of the Department of Dairy Industry at the College.

Dr. Sherman has won much favorable attention as a scientist, investigator and teacher. He has been connected with the staff of the University of Wisconsin and with the Pennsylvania State College. Since 1917 he has been bacteriologist in the Dairy Division of the United States Department of Agriculture. With his training and experience and with the finest dairy educational building and equipment in the world to work with, Dr. Sherman should be able to establish a Dairy Department at Cornell in keeping with New York's greatest industry.

The many friends of Professor W. A. Stocking will be glad to know that the Dairy Department of the college will not lose his services. Professor Stocking has rendered a splendid worth-while service to the dairy interests of the State and retirement from some of the active administrative duties of the department will give him more time for the teaching and research work which he wishes to do.

Amendments at This Election

VOTERS in New York State will be called upon at the coming election, in addition to voting for different candidates, to express their judgment upon the adoption of five proposed amendments to the New York State Constitution, and also upon a proposition to bond the State for \$50,000,000 to increase its hospital and charitable institutions and equipment. Each of the amendments proposed are given in full in this issue on page 284.

Without commenting either way upon the amendments submitted, we would like to say a word about the proposition before the people to increase the facilities for properly caring for our dependents. There is not the least doubt that there is grave need for such facilities. Many of the insane asylums are from forty to seventy-five years old, poorly constructed, and dangerous fire-traps. The maximum capacity of all of them in the State put together is 31,000 patients, and yet there are over 38,000 crowded into them. The buildings and equipment for taking care of crippled children and curable cases of tuberculosis and other State unfortunates are far less than what they should be.

In order to equalize the financial burden, it is proposed to raise the necessary money by bonds instead of trying to do it all by immediate taxation. Farm people as a rule vote against amendments which lead to increased taxation, and their judgment is good in doing so. It seems to us, however, that

this case is one of plain duty toward the unfortunates of life and that, therefore, we ought to vote for this proposition.

The Right Solution

AT a conference held in Chicago on October 18, plans were adopted for the organization of a series of State-wide wheat marketing associations for the purpose of helping the wheat growers to get more for their product. The plans adopted were similar to those already being used by the organization of cotton growers and the organized tobacco producers. The principle has the endorsement of some of the most prominent men and students of economics in the country. As some one at the conference said: "This wheat situation is an economic one and it requires an economic remedy; and the economic remedy is cooperative selling."

In other words, those back of this movement fully realize that those who want better prices for their wheat must themselves work to get it through cooperation rather than try to solve it by the artificial means of political or government action.

Eastman's Chestnuts

BIRGE KINNE, advertising manager of American Agriculturist, returned this morning from the National Dairy Show at Syracuse. Of course, the show ended Saturday night and this is Tuesday, but you know it always takes some folks quite a spell to get back on the job after any celebration. Besides, that has nothing to do with this story.

As soon as Birge got back, he came busting into the editorial sanctum sanctorum without knocking (on the door) and says, says he: "Ed, you've got to cut out writin' them there chestnuts on your editorial page."

And then I says, says I: "Birge in the first place, it seems that 'sociatin' with a smart editor like me ought to make you quit using such bad grammar; and in the second place, what do you mean by coming in here and telling me how to run 'The Good Old Reliable' by cutting out my chestnuts?"

"Well," he says, says he: "I met a feller at the Dairy Show who said them there chestnuts is the only thing in the old American Agriculturist worth readin', and I'm afraid he is right. If you keep puttin' them in, nobody will read nothin' else."

Well I let it pass. An editor soon learns not to pay any attention to the advertising manager.

But his speaking of the Dairy Show made me think of the large amount of good work done by W. E. Skinner, the manager, to make the show such a great success. And speaking of Manager Skinner gives me an excuse for telling a story about another Skinner, whose business it was to manage funerals instead of dairy shows.

The story is contributed by a faithful reader of my chestnuts who said I had better leave out his name because the story is true.

It seems that in a certain town there lived an undertaker by the name of Skinner, who had a helper whose name was Bill. The same town supported a butcher, called Bob by his friends, and Bob had a mother-in-law who died. Some are not so accommodating.

Skinner came to prepare the body. Being a very large woman, the body was more than he could handle alone, so Bob sent a boy for Bill to come and help.

The boy rang the bell. It was late in the evening, and Bill having started to retire, inquired from an upper window what was wanted.

"Bob's mother-in-law is dead," said the boy, "and he wants you to come up and help Skinner."

Champions of the Dairy Show

11.—Grand Champion Ayrshire bull, Hobsland Lucky Star owned by H. J. Chisholm, Port Chester, N. Y.

The Present Outlook in the Hog Market

There Are Five Big Factors Controlling the Present Market Situation

IN broad outlines the present hog market situation involves record production and record domestic consumption, large exports, a low ratio between prices of corn and hogs, and hog growers about to cut production. At the moment, the market is going through the season when supply invariably is the lightest of the year, but when hog meats and lard stored earlier in the season partly fill the gap in current receipts. Prices have had a welcome upturn to the highest point since the end of last October.

Somebody is producing too many hogs. Such was the conclusion of the committee of economists called by Secretary Wallace of the Department of Agriculture to report on the agricultural outlook. Their statement of the case was that "neither the corn situation, the prospective European demand, nor the domestic industrial outlook warrants the maintenance of the very heavy hog production of the past year."

The present excess of hogs goes straight back to the so-called corn surplus which started with the crop of 1920 and shows how, in the long run, extremely low feed prices fail to be of much advantage to the live-stock producer. In the last dozen years, the average farm price of 100 pounds of live hogs has been about equal to the average farm price of eleven bushels of corn. Late in 1920 this ratio changed so that corn could be sold for considerably more in the form of pork than it would bring at the elevator. As this relationship continued, producers began to breed more sows. By the time the early increase reached the marketing stage, demand for pork had expanded enough to absorb the supply at higher prices. Corn was still depressed however, and the corn-hog price ratio rose to around eighteen bushels toward the end of 1921 and early 1922. After that time the ratio began to go against the hog producer and by the summer of 1923, only eight bushels of corn were required to equal the farm price of 100 pounds of hog.

Producers, speaking of them in the mass, do not live up to the saying that "it is the first of all things to see events in their beginnings and to perceive tendencies beforehand." They continued to expand production after the handwriting appeared on the wall. About one per cent more pigs were raised in the six months ending June 1, 1923, than in the corresponding period a year previous and on that date, the number of sows bred or intended to be bred for fall litters was 28.3 per cent more than farrowed last fall.

Chart Shows Supply and Demand

The accompanying chart shows the chief elements in the hog market situation by calendar years since 1907, when the Federal Government first began to inspect the slaughter of meats in packing houses whose products entered interstate commerce. Pork slaughtered under Federal inspection is practically equivalent to the commercial supply. Domestic consumption and exports represent the demand side of the market.

In 1922, more hog product was slaughtered under Federal inspection than ever before. For the first six months of 1923 the output was twenty-seven per cent greater than in the same period of 1922. The same proportionate gain is unlikely during the last half of the year, but it is reasonable to expect that for 1923 as a whole the poundage of inspected hog products

will be about twenty per cent greater than last year. This is a remarkable gain to take place from one year to the next, especially since last year itself was a record breaker.

During the hog year, which in trade circles is counted as starting on November 1, domestic consumption and exports together must practically equal production. A look at the chart will show that domestic consumption of Federally inspected meats and lard has been hanging up new records each year beginning with 1920. In the first six months of 1923 the American public consumed twenty-four per cent more hog product than in the same period of 1922. For the year, as a whole, an increase of not far from twenty per cent is probable.

Since Federally inspected meats are consumed primarily in the cities and towns, the present era of urban prosperity has made it possible to market this enormous increase in the supply of pork without as large a decline in prices as would otherwise have taken place.

June 1. Prices since that date may have caused many farmers to change their minds. An epidemic of cholera might play havoc with both spring and fall pig crops. As things now stand, however, we had best count upon at least a moderate increase in numbers. Then there are the extra brood sows, which must come on the market when the country starts to prune down production.

While the corn crop is larger than last year, there is bound to be a smaller carryover. The crops of sorghum grains, of barley and oats also are larger and there is a lot of low grade wheat which will be fed. But, taking the increases in hogs and dairy and beef-cattle production into consideration, it is hard to escape the conclusion that feed costs will be higher than last year and that the corn-hog ratio will continue unfavorable well into 1924. Hog prices may remain about high enough to pay cost of production for the corn, however, even though they may not pay the full market price for it in all cases.

With higher feed costs, the tendency will be to sell at lighter weights. This is already noticeable. The decrease in weight may offset most of the increase in numbers during the coming year so that the actual supply of pork may show but little gain.

Eventually, as this unfavorable feeding ratio continues some one will breed fewer hogs. The in-and-out, who is always a factor in such a situation, will get out, those whose production costs are high will

Trends in the hog industry. Production and domestic consumption as shown above, include only hog meats and lard slaughtered under Federal inspection. Farm slaughter and uninspected local slaughter have but little effect on prices in central markets

Whatever the attitude of the city consumer may be toward long hours and high production in his own field, when it comes to consuming, he is a wonder. Employment and wage conditions have made it possible for all the pork-chop eaters to gratify their tastes.

The cotton belt provides a market for some of the Federally inspected hog product and the prevailing high level of cotton prices has broadened that outlet measurably. At the same time, two short cotton crops in succession have reduced the supply of cottonseed oil for the manufacture of lard substitutes.

Exports of hog products and lard as shown on the chart are much less uniform from year to year than domestic consumption. Outside of war periods they represent the surplus of hog production over domestic demand at current prices. From 1920 to 1922 exports were about fifty per cent above the pre-war level. In the first six months of 1923 they were 43.6 per cent larger than in the same period of 1922. They have tapered off since, but the total for the calendar year will probably exceed 1,800,000,000 pounds, which is eighty per cent above the pre-war level.

Looking ahead from this point we are justified in expecting that the number of hogs reaching the market in the next twelve months will be larger than in the last twelve. The corn belt alone, which furnishes most of the commercial supply of hogs, raised nearly six per cent more spring pigs this year than last, according to the government's findings. The western States as a group reported an increase of eighteen per cent, but the East and the cotton belt reported a smaller pig crop. Moreover, every State in the Union reported an intention to breed a larger number of sows for fall litters than farrowed in the fall of 1922. For the corn belt States the increase was 25.5 per cent. Again the western States led the field with an increase of fifty-one per cent.

These intentions were expressed on

take to their storm cellars and the regulars who have been raising more pigs than usual will raise fewer for a while and sell more corn.

On the demand side, the most important question is whether business depression is likely to occur before the adjustment of hog production to smaller volume is complete. Opinions of supposedly competent authorities are strangely divided as to when such a depression will occur, but relatively high purchasing power is likely to prevail in the cities well into 1924, at least. On the other hand, domestic consumption has probably about reached its upper limit except as it is stimulated by low prices at retail.

With low prices prevailing, Europe will take a lot of pork and lard, but if prices should rise to a point that would be substantially profitable to the grower the volume of exports undoubtedly would decline.

Foreign buying power remains extremely low and Germany, our chief lard customer, is in a sorry plight with over a million paper marks required to buy a pound of lard in our markets, to say nothing of the transportation and distributing cost. In short, we are able to supply with pork about 20,000,000 more people than are in the United States, but that number of good customers is not to be found abroad.

Seasonal Trend in Short Range View

The short range view of prices is dominated by seasonal conditions of supply. Receipts always are lightest from the middle of August to the end of September and prices usually reach the year's high point at that time. Furthermore, this is the season when the demand for lard and cured meats picks up and packers are credited with being willing to see an advance in hog prices in order to help the sale of the products stored away earlier in the year.

Spring pigs usually begin to troop to market early in October when

NEW LAMP BURNS 94% AIR

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

More Milk Profits

Clipped Cows give more milk and butter fat. They are cleaner, healthier—feel better, feed better. Filth and lice cannot accumulate—bigger returns are positively assured.

Stewart No. 1 Clipping Machine makes clipping quick, easy, thorough. Very highest quality, lasts long.

Cover Crops Save Plant Food From Leaching Away

NATURE utterly abhors a vacuum. If a horse gallops across your lawn, kicking out a turf, next week there will be a weed—probably several—growing there to fill that hole with humus and captured rubbish and cover the bare spot. There is no surer sign of ignorant farming than bare, brown fields in fall and winter, excepting of course a late-plowed field for a special purpose.

A crop of anything—weeds if you don't provide legumes or turnips and timothy—is working for nothing, every minute for you, gathering fertility that might otherwise go to waste and "organizing it" in tops and root, ready to pass along both its humus and fertility to your next crop—a multiplication and addition, not a subtraction and loss. You can take a growing crop of anything, even so poor a stuff as buckwheat, and by plowing in under over and over, make a field rich as mud with the addition of no particle of anything except the actual seed used!

"Oh," but you say, "those plowings

By DAVID S. KELSEY

almost anything that will sure-catch and grow quickly, we will accomplish five very desirable objects:

Anticipate and smother out the weed crop by preoccupying this finely prepared seed bed with something better.

Save the still fast-forming soil-nitrates, that would otherwise be leached away and lost, by growing them into "organic" forms of manure that will keep till another year's farm crop can use them.

Provide Nature's form of protection against the pounding and washing of rains for the eight months ahead (a highly important objective).

Keep our soil bacteria active, multiplying, and at work at a time of year most favorable to them—thus preparing (by dissolving and growing it into the bodies of our catch-crop) further stores of mineral plant-food, especially potash, phosphorus and calcium.

And finally, we shall have greatly increased our permanent supply of soil humus, which of itself will promote

As soon as the potato crop is "off," rye should be broadcast and harrowed in immediately, thereby affording a cover and furnishing a soil builder

would cost too much." But you are going to plow anyway in the cases cited below, so that costs you nothing.

The great reason why hay is to-day the most universally and surest-paying farm crop, the world-over, is that it fully occupies the "growing season"—every minute of the unfrozen year it is gathering something for you; and second, it always provides a lot of stuff to plow under, adding both fertility and that *subtle*, but really most valuable element of all successful agriculture, humus. The same thing is only less true of the winter grains, explaining why they are so reliably profitable on the same fields year-after-year, without rotation, and even when the average yield is very low.

To put five dollars down on a patch of land and pick up \$100 is no longer a miracle. Some of my neighbors are doing it every year—with cover-crops, and one dollar per acre is a good average charge for the expense, the \$20 per acre so saved is a very low estimate. They seed a catch-crop of most anything at the last cultivation—and behold! Instead of rag weed and shepherd's purse and quack and chick and a horde of others—instead of nine months of bare, washing, blowing, rain-hammered land from which every bit of soluble plant food is being soaked, its humus content washed away and the finest mineral particles blown off into the brush—there stands, knee-deep, a green and smiling preventative of all these self-imposed plagues of Egypt.

The demands of intensive tillage, however, are far more exacting. During September and October in any hoed crop, but especially in corn, the upper three inches of soil are far richer in soluble plant food than the next three or four inches below, where the crop roots have been feeding, "close-cropping" it as a pasture. The same thing is very vividly true in any August potato field, hence the great rush of every sort of foul stuff there, as the tops give up. Now if we seed into that corn a cover crop at last hoeing—

both bacteria and chemical dissolving favorable to our next regular crop. Be what it may, your next crop on that land will have conditions vastly more in its favor. That field will be a more "comfortable" place for plant-life, for humus makes moist, cold land better drained and warmer, and hot, dry land more cool and moist.

And it is easy to continue this list. If your cover-crop is a legume such as crimson clover or winter vetch (called also Russian, sand and hairy vetch) you will not only have provided the best of early spring pasture, and have gathered the soil nitrates, but you will have captured increased stores from the air. If it is any kind of turnip or rape, these have dissolved and "organized" new minerals direct and of themselves—without the assistance of the usual bacteria. If, again, it is rye or timothy, you have there provided a fine March and April pasture, where poaching feet will do the least harm, or if preferred a hay or soiling crop for May.

A QUESTION OF CROP ROTATION

I plowed under seven acres of good sod a year ago and planted it to potatoes this year. I would like to know whether I could plant beans on this piece next year, seeding it to wheat next fall? Neighbors say beans do not do well after potatoes, although I do not see the difference.—C. S., New York.

According to Professor E. V. Hardenburg of the New York State College of Agriculture, an authority on crop rotations, there is no basis for the idea that beans will not do well after potatoes, especially since these crops have quite different habits of growth and corresponding feeding requirements. Potatoes usually do better than beans on old sod land. The seed bed requirements for beans is too little appreciated and therefore, it is recommended that beans will profit well by a seed bed in good tilth. Another good reason for having potatoes follow sod ahead of beans is that potatoes have a high humus requirement compared to most field crops.

BEFORE YOU BUY A WINDMILL

Carefully consider the following facts: A year's supply of oil is sent with every Aermotor. The Auto-oiled Aermotor is the Genuine Self-oiling Windmill, with every moving part fully and constantly oiled.

The Auto-oiled Aermotor has behind it 8 years of wonderful success. It is not an experiment. The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet. Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

You do not have to try an experiment to get a windmill which will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine. Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Auto-oiled Aermotor is so thoroughly oiled that it runs in the lightest breeze. It gives more service for the money invested than any other piece of machinery on the farm. The Aermotor is made by a responsible company which has been specializing in steel windmills for more than 30 years.

For full information write **AERMOTOR CO.** Chicago, Kansas City, Dallas, Minneapolis, Des Moines, Oakland.

LAST-BEST-BIGGEST Army Camp Bargains

We bought three enormous Army Camps from the U. S. Government for cash. Camp Dix, Camp Meade and Camp Grant. That's why we give you such amazing money-saving prices on lumber and building materials now! If you have any intention of building a house, barn, shed or other building this year or even next year. Buy Now!

During this Gigantic Sale our prices are the lowest since the war. We say above that you save \$150 to \$350 on every carload, but this is conservative. Hundreds of keen buyers have already found that we do save them more. Even if you cannot use a whole carload we save you just as much in proportion.

Wallboard Per Square 60c and up

Radiators Per Sq. Foot 27c

PIPE 3/4" Per Foot 4c

Build Now! Material Prices Smashed!

Just think of three enormous Army Camps each with over 1000 buildings containing 75,000,000 feet of lumber of all kinds, such as Dimension, Timbers, Flooring, Sheathing, Dropsiding, Boards, Battens, Beaded Ceiling, etc., all offered during this Gigantic Sale at prices ranging up from \$16 PER THOUSAND. You can even buy a complete house or stable as it stands and we will load it on cars for you.

In addition there are over 200,000 high grade sash, doors and windows, 100,000 rolls of roofing, 60,000 squares of wallboard, Miles of galvanized and black pipe, Electric wire, Cattle Troughs, Ventilators, Soil Pipe, and other materials too numerous to mention.

Mail Coupon Today for Free Bargain Catalog!

Just mail this coupon to get our Free Bargain Catalog which gives prices and actual photographs of everything at these camps. Intensely interesting to everyone who builds and repairs.

FREIGHT PAID PRICES GIVEN FREE!

To save time send us a list of your lumber and material needs when you mail the coupon. Our expert estimators will then send you free with the Catalog a Complete Freight Paid Price on your requirements.

News From Among New York Farmers

League Increases October Fluid Milk Prices—State and County Notes

THE Dairymen's League Cooperative Association announces that milk going into Class 1, entering into fluid consumption was increased for the last two weeks in October. The former price was \$2.98. The price for Class 1 milk from the 16th to the end of the month has been increased to \$3.25.

NATIONAL LEADERS ON APPLE EXPOSITION PROGRAM

The leading marketing and agricultural men in the United States will talk at the Eastern Apple Exposition and Fruit Show, to be held at the Grand Central Palace in New York City, November 3 to 10, according to the General Plans Committee of the Exposition.

These men will head up the program of the American Pomological Society which meets at the Exposition November 6, 7, and 8. Almost every phase of growing and marketing of interest to farmers will be treated in their addresses.

Aaron Sapiro, general counsel for the largest farmers' cooperatives in the country, will tell of the development of cooperative marketing during the past year. The management side of cooperative marketing will be handled by A. R. Rule, General Manager of the Federated Fruit and Vegetable Growers. The extraordinary results obtained at the Geneva experiment station in the breeding of new fruit will be told by Professor Hedrick who is in charge of the experiments. Many other brilliant investigators or prominent leaders are on the program, including Professor F. C. Sears of Massachusetts, R. G. Phillips, secretary of the International Apple Shippers' Association; Paul Stark of Missouri, and Professor C. K. Lewis, editor of the "American Fruit Growers."

One day of the Exposition will be known as Transportation Day when railway executives and traffic men will discuss the problems of shipping and packing farm products. The railroad men will also conduct an extensive trip, through the wholesale markets for visiting farmers and shippers. A moving picture of the wholesale markets will be run as a part of the daily motion-picture program for those unable to visit the markets. New England States have arranged for an apple packing contest to be staged at the show. Every type of equipment used in a modern packing plant will be operated and the latest methods of packing, including boxed apples, demonstrated.

PROPOSED AMENDMENTS TO NEW YORK STATES' CONSTITUTION

When voters of New York State go to the polls they will find on the ballot, five proposed amendments to the constitution and one proposition. They will be asked to vote "yes" or "no" on each of these.

Amendment Number 1, has to do with the soldiers' bonus, and will read on the ballots as follows:

Shall the proposed amendment to Article 7 of the Constitution empowering the legislature to create a debt or debts not to exceed \$45,000,000 to provide for the payment of bonuses to honorably discharged soldiers, sailors and marines of the World War who were residents of the State when they entered the military service of the United States, be approved?

Amendment Number 2, known as the Home Rule Amendment, makes provision for taking more power from the State Legislature and giving it to the cities. It will appear on the ballot as follows:

Shall the proposed amendment of Article 12 of the Constitution, known as the Home Rule Amendment, authorizing every city to pass local laws in relation to its property, affairs and government; except the public school system, and restricting the legislature, except in emergencies on message from the Governor, to the passage of general laws affecting all cities alike, be approved?

Amendment Number 3, authorizes the State Legislature to use some of the State lands for the development of water power. On the ballot it will read as follows:

Shall the proposed amendment to Section 7 of Article 7 of the Constitution authorizing

the legislature to provide for the use of not more than 3 per cent of the Forest Preserve lands for the development by the State of water power for the public benefit and for the construction and operation thereon of all works and transmission lines necessary therefor and also permitting such water power development by private capital under leases not to exceed fifty years and under supervision of the State but forbidding the use of such power for business purposes on State lands, be approved?

Amendment Number 4, provides that the debt limitation of city or county may not be affected by any exemption of assessed property from taxation. The amendment as it will appear on the ballot reads as follows:

Shall the proposed amendment to Article 8 of the Constitution, providing that the debt limitation of a city or county and the limitation of the amount of annual taxes therein shall not be affected by any change in taxation by which real property is exempted or removed from the assessment rolls and retaining for such debt and tax purposes the valuation of such property as it last appeared on the assessment rolls and authorizing the legislature to confer jurisdiction upon the Appellate Division of the Supreme Court to determine the valuation of such property, be approved?

Amendment Number 5, gives the privilege of voting to inmates of soldiers' and sailors' home. It reads as follows:

Shall the proposed amendment to Section 1A of Article 2 of the Constitution authorizing the legislature to provide for the absent voting at general elections of voters who are inmates of soldiers' and sailors' homes, be approved?

That completes the amendments, but on the ballot also under the heading of "Proposition Number One" the voter will be asked to pass judgment on the question as to whether or not the State shall issue bonds not to exceed \$50,000,000 for the construction of more hospital and charitable institutions in the State. The proposition will read on the ballot as follows:

Shall Chapter 591 of the Laws of 1923, entitled "An Act making provision for issuing bonds to the amount of not to exceed \$50,000,000 for the construction of buildings for certain institutions for the care, support, instruction and training of the wards of the State, and providing for the submission of the same to the people to be voted upon at the general election to be held in the year 1923," be approved?

NEW YORK COUNTY NOTES

There is continued activity among the milk interests of the North Country. Sheffields Milk Company have announced their intention of building a station at Lafargeville to compete with the newly acquired League plant, and are making active preparations. The Dairymen's League have purchased the station at Orleans Four Corners from the Farmers' Cooperative Association that has owned it for a number of years, and are considering the erection of a large plant at Potsdam. The latter would be the center of a large territory, and would probably take care of milk from both St. Lawrence and Franklin Counties. The cooperative plant at Eben which burned a few weeks ago will probably be rebuilt by the League.

The death of John McKenzie of Brownville removes one of the pioneer Dairymen's League members and workers of the North Country. He was widely known in Jefferson, Lewis and St. Lawrence Counties as he had done much to get the original League on its feet during the early days.

Jefferson County Agent W. I. Roe resigned at the last board meeting, to enter other work, after nearly six years of work in the North Country. His successor has not yet been appointed.

Potato digging is under way, but the potatoes are rather green and there is much "barking." The yield indicates an average of about half a normal crop in Jefferson County. The late rains helped out, but at the same time have induced a second set and there are many very small potatoes on the vines. Silos are all filled. The corn was very sappy, and a great deal of leakage has been reported. The usual stories of catching corn juice from the bottom of the silos are going around, but those who have actually tried drinking the liquid wish they hadn't. Fall plowing has started, but there has not been rain enough so far to make the sod easy to turn.

In Lewis County several large farm fires recently have stirred up the people to an extent where they are looking for incendiaries. As most of the farm-

ers were not nearly covered by insurance, they have suffered heavy financial loss.

Franklin Co.—The potato harvest is practically completed. The yield in most fields is not as large as was expected earlier in the season. This was undoubtedly due to the extreme dry conditions during the summer months. Most farmers are inclined to hold their stock as the prices paid at shipping stations are only 62 cents a bushel. Quite a number of farmers from Franklin County attended the Dairy Show at Syracuse last week. Milk in shipping stations has fallen off very rapidly lately. Cows are most all on full feed in the barns. We are having excellent weather for all kinds of fall work. Loose hay is bringing \$16 a ton, new oats 50 cents a bushel, fowls 30 to 35 cents a pound, wheat \$1.25 a bushel, eggs 50 cents.—H. T. J.

In Western New York

Wyoming Co.—Bean thrashing is under way. Reports thus far indicate that the yield of beans will not be heavy. Silos are about all filled. Corn on valley land was badly damaged with frost. Apple growers are having fine weather to harvest their crop. Pickers are scarce and wages are high. Butter 34 to 37 cents, eggs 45 cents, veal calves 12½ cents live weight.—J. H. E.

Chautauqua Co.—We have been having excellent fall weather. We are still in need of some rain. Corn and potatoes in our immediate section are still green the first week in October, when we have had frost all around us. The demand for fresh cows and springers is very good. Also for cattle, sheep and lambs. The apple crop is short. The hay crop is also short.—P. S. S.

In Central New York

Tompkins Co.—Silo filling and corn harvesting are two fall jobs that were pretty well cleaned up by the fifteenth. Corn husking is in full swing. The crop is turning out fairly well. Potatoes are not up to last year by a long way. They are selling for \$1 a bushel. The winter apples are being picked. The crop is not up to last year and many farmers are only picking enough for their own use, as there is no help available to pick the whole crop. Wheat setting was all done on schedule. There was very little second cutting of hay made as fall pastures were very short. Fresh cows are selling at good prices. A carload of Michigan stock sold in Flemington on October 13, from \$120 to \$200 a head. Eggs are bringing 54 cents a dozen and old corn is bringing \$1.20 a bushel.—J. R. F.

Cortland Co.—Silo filling was completed by the fifteenth of this month, in our section. Many farmers were unable to fill their silos completely on account of the short corn crop. Those who have cabbage to sell are receiving \$10 for early varieties and \$13 for the late. The crop is much better than was expected earlier in the season. The potato crop is below average. The farmers are now getting 75 cents a bushel at the car and \$1 when peddled in the city. Eggs are bringing 45 cents. A large number of people from our section attended the Dairy Show at Syracuse.—G. A. B.

In the Hudson Valley

Rensselaer Co.—Silos are all filled. Apple picking is now in full swing. Onions are in the buyers' hands. The crop was light in this section. Cabbage is coming up nicely. The game season has opened and sportsmen are out in full swing. In fact there are more hunters than game, as many boys who have just turned seventeen have taken out licenses. Rabbits are fairly plentiful. Fall calves are in demand, the price ranging from 9 to 15 cents. Sheep and lambs are selling well. Buckwheat didn't head out well at all owing to dry fall. In fact some fields were not worth cutting.—C. H. Y.

"I like this paper best of any farm paper I ever took."—Howard Rathbun, Oswego, N. Y.

With the Youngsters at the Dairy Show

Calf Club and Judging Contest One of the Features of the Exposition

TO some the most interesting of all the attractions at the National Dairy Show in Syracuse were the events featuring the skill of youthful owners of calves and the work of the junior judging teams. Back of them lay hidden many real stories of tremendous human interest. They vindicated Uncle Sam's plan of a new generation trained

By MRS. M. G. FEINT

decisions, crowding close up in a dense circle. One of these times was when he gave the blue ribbon to Gordon Riley of Brunswick, Ohio, for his Holstein yearling, placing second award on an animal entered by Harold Fogg of Bridgeton, New Jersey.

The judge was undoubtedly right and he explained the points in which the Ohio animal excelled.

Young Clinton Stimson, 7 years old, with his chubby face and sparkling eyes and blue ribbon decked Ayrshire calf, was one of the stars of the occasion. The calf, Craigy Burn Spicy, was frisky and Clinton not quite so tall as his championship calf. When asked if he'd like to have a picture taken of himself and his pet, he said, "Well, this might not happen again." He followed the camera man out-

side, bidding him hurry as his father had cautioned him that he needed to watch the rest of the judging. Then began the fun of posing a lively calf and an excited youngster.

Ribbon winners among the boys and girl owners were:

Holstein yearlings: (1) Gordon Riley, Brunswick, Ohio; (2) J. Harold Fogg, Bridgeton, N. J.; (3) Joseph Krog, Plainfield, N. J.; (4) Pearl Walker,

Guernsey yearling heifers: (1) Alida Amoss, Fallston, Md.; (2) Georgia Hadley, New Brunswick, N. J.; (3) Courtney Woodside, Mount Holly, N. J.; (4) Harold W. Smith, Boonton, N. J.; (5) Melva V. Smith, Bound Brook, N. J.

Guernsey calves: (1) William Amoss, Fallston, Md.; (2) Riggs Derby, Boyds, Md.; (3) James Kelly, Towson, Md.; (4) Mary E. Lynch, Stanley, N. Y.

It will be seen that New Jersey juniors got the most awards. Of the 20 States sending young entrants, New Jersey sent the most—a special train load under special supervision, with 60 boys and eyes girls and their calves. New York and Maryland youngsters made a splendid showing, however.

New York was the first to enter a demonstration team. They had been selected as the result of two State-wide contests, held at Cornell and at Batavia. They were in competition with teams of 16 other States on Monday and Tuesday, in demonstrating the "Feeding of the Dairy Cow." Though New York's team stood sixth, they gave a fine demonstration, one in which their State may take real pride.

NEW YORK SCHOOL BOYS WIN JUDGING CONTEST

Another one of the features of the Dairy Show especially arranged for juniors were the judging contests for boys attending vocational training schools. Of the six highest teams, New York had three. Perry, N. Y., won first place with 1168.9 points just nosing out Middletown, Ct., which school had a score of 1168.5. Morrisville, N. Y., came third with 1133.8 points. Belleville, Pa., scored 1127.4, just five

points ahead of Almond, N. Y., which scored 1122.3. Newton, N. J., was sixth with a score of 1102.9.

The members of the winning team from Perry were Floyd Chamberlain, Benson Krause, and Jas. Purcell. These boys constituting the Perry team won the National Dairy Association cup.

A team from Hacketstown, N. J., won a beautiful cow model for judging Jersey cows. The model was donated by the American Jersey Cattle Club. A team representing Troy, Pa., won another cow model, scoring highest on Jersey calves.

The individual dairy association medals were given to three highest scoring individuals. Russel Anderson of Middletown, Ct., won the gold medal, A. Denvenpeck of Cobleskill, N. Y., won the silver medal while the third, bronze, went to Floyd Chamberlain.

The individual dairy association medals were given to three highest scoring individuals. Russel Anderson of Middletown, Ct., won the gold medal, A. Denvenpeck of Cobleskill, N. Y., won the silver medal while the third, bronze, went to Floyd Chamberlain.

This is seven year old Clinton R. Stimson of Spencer, N. Y., and his champion blue ribbon winning Ayrshire heifer Craigy Burn Spicy

in dairying, a generation thoroughly in love with farming and one whose pleasure it will be to provide the milk supply of 20 or 30 years hence.

Started only a few years ago, Uncle Sam's dream has largely come true, and there are thousands of boys and girls calf clubs and youthful judging experts and young demonstrators of right methods of feeding, care and handling of cattle in the country to-day. Eliminations by local, county and state tests had assured to the National event boys and girls who were well able to give a good account of themselves before the thousands of observers.

The big barn which housed the 100 entries of the various calf clubs from all over the country was an interesting and picturesque place to visitors all the week. It was well worth watching to see boys and girls from many States exchanging experiences, brushing and scrubbing away on their calves, clipping them and getting them into the pink of condition.

The great Dairy Show was magnificently housed, with the many gigantic buildings thronged with people. But the Coliseum was the one place where interest never lacked. Scene followed scene with kaleidoscopic interest with the plaudits of the crowds when the judges placed awards on world famous cattle.

There were plenty of people in the thousands who daily sat at ease in the new building erected by New York State, who perhaps knew very little about good dairy cattle, as it was at all times a cosmopolitan crowd. Yet no one tired of the varying spectacles, and when the owners of the hundred calves trooped into the ring and gathered closely around Professor W. W. Yapp of Urbana, Ill., to watch the placing of their treasures, one of the most keenly interested events of the week occurred. The antics of the calves, the quaintness of the young owners, some of whom were too little to hold their capering charges with ease, kept the observers in their seats for hours.

Prof. Yapp found rough going in trying to please all of his young rooters, who in their enthusiasm at times demanded to know why he made certain

New Jersey was outstanding in the boys and girls exhibits. Here are the boys from the Garden State and their exhibits, which took the first prize for State Calf Club exhibits

Gaithersburg, Md.; (5) Grover Walker, Gaithersburg, Md.; (6) Wm. Walker, Gaithersburg, Md.

Jersey heifer calves: (1) Stanley Kagan, Pottersville, N. J.; (2) Fendall Cushing, Street, Md.; (3) Walter Bean, Jr., Sherbourne, N. Y.; (4) Barbara Lucksinger, Onondaga Valley N. Y.; (5) Donald Stubbs, Delta, Pa.; (6) Alfred Kagan, Pottersville, N. J.

Jersey yearling heifers: (1) Ernest Juliano, Medford, N. J.; (2) Mason Wilson, Pylesville, Md.; (3) William G. Rowlinson, Oxford, N. Y.; (4) Peter Lucksinger, Onondaga Valley, N. Y.; (5) Lloyd Fallman, Columbus, N. J.; (6) Harold Ringe, Mouson, Mass.

Jersey two-year olds: (1) Donald Poinsett, Columbus, N. J.; (2) Herbert Harriett, Medford, N. J.

Ayrshire heifers: (1) John Barrows, Forest Hill, Md.

This is Harry Choate of Lancaster, N. Y., and his Holstein heifer, Locust View Evelyn, with which he took fourth prize

A Wise Old Trapper

In the state of Ohio there lived a bunch of boys who had this trapping business down to a science. They each sent for separate price lists every year and then sent all their furs to the house giving the best quotations. After five years they decided they weren't so dreadfully wise because they didn't have enough profits to make their efforts worth while.

One day they met Tom McMillan driving a new car to town. Tom said he made the price of his swell outfit shipping pelts. He told how he got wise to those funny prices and found it was better to deal with Chas. Porter because he always knew in advance just what he was sure of getting. He said that Porter never offered \$5 for a \$3 pelt but he always paid the \$3 which he promised and sometimes just a little better. Chas. Porter now has five wise trappers in that section instead of one.

Don't Take a Chance with your FURS

Send us your name and address. Get our Price Lists, Shipping Tags, and full particulars. Do it right now. This means real dollars to you, so don't put it off. Write today.

Your furs mean real dollars to you. Why sell them to some fellow who offers you \$1.25 when you know blame well you are lucky to get fifty cents. Ask the wise trapper who knows. Once a Chas. Porter shipper and you will always be one. You know in advance that we give a square deal and every shipment brings sure money.

CHARLES S. PORTER, Inc.

Answers to Questions Received From A. A. Readers

Please advise me as to the best method of truing up grindstones that are out of round.—(E. A. G., New York.)

THERE are special tools made which are used in truing up grindstones, but if you have an old file I think you can make it work practically as well with a little patience. If your grindstone is badly out of round, it may take quite a little work to bring it back into shape, and even then it may not give you real satisfaction. A grindstone wears out of round because one side of the stone is softer than the other. Sometimes it may be that the stone is naturally that way, but often they become so from having been left standing out of doors, exposed to sun and rain. The side that is uppermost will wear away the fastest, and of course it does not take very much action to unbalance the wheel.

Now, to true up your stone, take your old file, place it firmly against the frame of the grindstone, and then turn the stone, letting the end of the file scrape off small portions of the wheel. As said above, it may be a tedious and troublesome job, but this method will work.

A PEST OF STORED MEATS

We have had some trouble keeping smoked meat. It keeps all right as far as preserving is concerned and it tastes delicious, but at this time of the year a bug gets in it, eating holes throughout the meat, not in one place but all through it. We are sending you some specimens and wish you would let us know how to overcome the insect. When we put up our meat we weigh it and for each 100 pounds we use 8 pounds of salt, 2 pounds of sugar, 2 ounces saltpetre and soda.—J. J. M., New York.

The insect is known as the larder beetle. The beetle is the adult insect and the grub is the young stage. This insect is a pest of hams, bacon, and other smoked meats. The larvae also attack horns, hoofs, skins, beeswax, feathers, hair, and museum specimens. The insects sometimes become a great pest in places where meats are stored. Where they are present in great numbers it is a pretty sure indication that they have a breeding place in some neglected meats from which the beetles spread to the new supply. The first thing to do is to make a thorough cleaning of the storeroom, getting rid of all possible material on which they can feed and thus stop the breeding of the beetles. After the storeroom has been thoroughly cleaned and washed out with soapsuds it should be sprayed with gasoline or fumigated with either carbon bisulphide or hydrocyanic gas. The latter is deadly poisonous to stock; use care with it. Keep fire away from carbon bisulphide gas. Cheese ground up and poisoned with arsenic and placed in the haunts of the beetles will often kill many of them.

In putting away smoked meats they should be bagged just as soon as they are finished and great care should be taken to make the bags tight, because the beetles will work their way through

FEMALE HELP WANTED

A COMPETENT, RELIABLE WOMAN for family cook, all electric and gas appliances, private room and bath. Excellent opportunity is offered for all-winter employment to right person in very refined home located in center of Herkimer, N. Y., making environment almost ideal. Wages, \$50 per month. If interested, call or write C. H. S., 245 N. Main Street, Herkimer, N. Y.

HELP WANTED

ALL MEN, WOMEN, BOYS, GIRLS—17 to 65, willing to accept Government positions, \$117-\$250, traveling or stationary, write MR. OZMENT, 258, St. Louis, Mo., immediately.

MISCELLANEOUS

SHOES REPAIRED, ½ soles and heels, men's \$1.40, ladies, \$1.20, children's 90c and postage returned C.O.D. parcel post. VAN NESS, Pompton, N. J.

any little hole or crack in the bag. New paper flour sacks are very good to put the hams in. If they are tied tight enough to keep the beetles out, they will give excellent protection, but one must be certain that neither beetles nor eggs are on the hams when they are put in the bags.

MOISTURE IN ENGINE EXHAUST

I have about a 15-foot exhaust pipe on my engine. In freezing weather there forms an icicle on the end of the pipe, keeps freezing until the hole is completely covered with ice. I have to take hot water to keep the passages clear. What is the cause of this, and what will I do to stop it? This plant is run by gasoline.—E. F. M., New York.

Probably most of the moisture which troubles you in the exhaust pipe of your engine is taken in through the air intake of the engine itself, and driven out through the exhaust. Cold air has very high relative humidity, that is, it normally contains much more moisture than does hot air. When cold air is taken in through the intake, and heated in the explosion chamber of the engine, most of this moisture is driven out of the air, and naturally carried out through the exhaust pipe, and upon reaching cold air will naturally freeze.

I do not know of any practical way in which this trouble can be eliminated, except to protect the pipe in some way so that the opening is not exposed to such freezing weather. Would it be possible to arrange the exhaust pipe differently so as to have it more protected? It may be that simply wrapping the pipe with some nonburnable insulating material will keep it so warm through its entire length, that the moisture will not condense on, or in the pipe itself.

REMOVING IMPURITIES FROM SPRING WATER

I have a system of running water on my farm that troubles with particles of sand in it. I tried sinking a barrel about 25 feet from the spring, putting the pipe in one side, part way up, attaching the other one on the other side, thinking that the sand would settle to the bottom. This did not help any. The spring is not large enough to permit the water running a full pipe all the time. It gets below the pipe and lets air in the pipe. Can you tell me of some inexpensive way to remedy this? When we draw water ahead and let it set, the particles soon settle to bottom of pail and are all shapes, some long, some short. The water looks perfectly clear up in the spring.—J. R. J., New York.

Very often water which is taken from springs or near-to-the-surface sources is likely to contain impurities which may be mineral in origin or which may simply be organic material which is carried in the water in suspension. Perhaps if you used a receptacle larger than the barrel and put in baffle-boards so as to retard the flow of the water, it might be held quiescent long enough to allow the impurities to collect and settle. The barrel is rather small to function as settling chamber. Perhaps a series of barrels will overcome the difficulty. Otherwise, try a large chamber, with baffles to check the agitation caused by the inflow. Baffles will help also if a series of barrels were used.

Questions and Answers on the School Bill

(Continued from page 278)

Q. 44. In what respects are the people given greater control?

A. In employment of superintendent and fixation of his salary, in condemnation of buildings, in consolidation of schools, in transportation of children, etc.

Q. 45. What school districts are classed as rural school districts?

A. All districts having less than 4,500 inhabitants.

"I want to say I have been a subscriber to your paper for more than thirty-five years and want to say I believe it to be the best all-around farm paper I have ever read and would not be without it for twice the price of it."—E. Z. Purdy, Lirktown Hts., N. Y.

The Broad Highway—By Jeffery Farnol

THE path sloped up gently before me, with a thick hedge upon my right, and, after crossing a brawling stream, lost itself in the small wood or coppice, that crowned the ascent. Wondering, I hastened forward and then, happening to look through the hedge, which grew very thick and high, I stopped all at once.

On the other side of the hedge was a strip of meadow bounded by the brook I have mentioned; now across this stream was a small rustic bridge, and on this bridge was a man. Midway between this man and myself stood a group of four gentlemen, all talking very earnestly together, to judge by their actions, while somewhat apart from these, his head bent, his hands still thrust deep in his pockets, stood Sir Jasper. And from him, my eyes wandered to the man upon the bridge—a tall, broad-shouldered fellow, in a buff-colored greatcoat, who whistled to himself, swinging his tasseled riding-boot to and fro. All at once, as if in response to some signal, he rose, and unbuttoning his surtout, drew it off and flung it across the handrail of the bridge.

Mr. Chester was on his knees before the oblong box, and I saw the glint of the pistols as he handed them up. The distance had already been paced and marked out, and now each man took his ground—Sir Jasper, still in his greatcoat, his hat over his eyes, his neckerchief loose and dangling, one hand in his pocket, the other grasping his weapon; his antagonist on the contrary, jaunty and debonnaire, a dandy from the crown of his hat to the soles of his shining boots.

Their arms were raised almost together. The man Selby glanced from one to the other, a handkerchief fluttered, fell, and in that instant came the report of a pistol. I saw Sir Jasper reel backward, steady himself, and fire in return; then, while the blue smoke yet hung in the still air, he staggered blindly, and fell.

Mr. Chester, and two or three more, ran forward and knelt beside him, while his opponent shrugged his shoulders, and, taking off his hat, pointed out the bullet hole to his white-faced second.

And in a little while they lifted Sir Jasper in their arms, but seeing how his head hung, a sudden sickness came upon me, for I knew, indeed, that he would go walking back nevermore. Yet his eyes were wide and staring—staring up at the blue heaven.

Then I, too, looked up at the cloudless sky, and round upon the fair earth; and, in that moment, I, for one, remembered his prophecy of an hour ago. And, indeed, the day was glorious.

CHAPTER XI

WHICH RELATES A BRIEF PASSAGE-AT-ARMS AT "THE CHEQUERS" INN

IN due season I came into Tonbridge town, and presently observed a fine inn upon the right-hand side of the way, called "The Chequers."

And presently, as I paused before the inn, there issued from the stable yard one in a striped waistcoat, with top-boots and a red face, who took a straw from behind his ear, and began to chew it meditatively; to whom I now addressed myself.

"A fine day!" said I.

"Oh!" said he, and shifted the straw very dexterously from one corner of his mouth to the other, and stared up the road harder than ever.

"What are you looking at?" I inquired.

"Ill," said he.

"And why do you look at the hill?"

"Mail," said he.

"Is it the London coach?"

"Ah!" said he.

"Does it stop here?"

"Ah!" said he.

"Do you ever say anything much beside 'ah'?"

He stopped chewing the straw, and with his eyes on the distance, seemed to turn this question over in his mind; having done which, he began to chew again.

"Ah!" said he.

"Why, then you can, perhaps, tell me how many miles it is—"

"Five," said he.

"I was about to ask how far it was to—"

"The Wells!" said he.

"Why—yes, to be sure, but how did you know that?"

"They all ask!" said he.

"Who do?"

"Tramps!" said he.

"Oh! so you take me for a tramp?"

"Ah!" said he.

"And you," said I, "put me in mind of a certain Semi-quavering Friar."

"Eh?" said he, frowning a little.

"You've never heard of Rabelais, of course," said I.

"No," said he.

"More 's the pity!" said I, and was about to turn away, when he drew the nearest fist abruptly from his pocket.

"Look at that!" he commanded.

"Rather dirty," I commented, "but otherwise a good, useful member!"

"It's a-goin'," said he, alternately drawing in and shooting out the fist in question, "it's a-goin' to fill your eye up."

"But what for?"

"I are n't a Semmy, nor yet a Quaver, an' as for Friars," said he, very deliberately, "why—Frier yourself, says I."

"Nevertheless," said I, "you are gifted with a certain terse—"

"Joe!" he called out suddenly over his shoulder. "Mail, Joe!"

Lifting my eyes to the brow of the hill, I could see nothing save a faint haze, which, however, gradually grew denser and thicker; and out from this gathering cloud, soft, and faint with distance, stole the silvery notes of a horn. Now I saw the coach itself, and, as I watched it rapidly descending the hill, I longed to be upon it, with the sun above, the smooth road below, and the wind rushing through my hair. On it came at a gallop, rocking and swaying, a good fifteen miles an hour; while clear and high rang the cheery note of the horn. And now, from the cool shadows of the inn yard, there rose a prodigious stamping of hoofs, rattling of chains, and swearing of oaths, and out came four fresh horses, led by two men, each of whom wore top-boots, a striped waistcoat, and chewed upon straws.

And now the coach came thundering down upon "The Chequers," chains jingling, wheels rumbling, horn braying and, with a stamp and ring of hoofs, pulled up before the inn.

And then what a running to and fro! what a prodigious unbuckling and buckling of straps, while the coachman fanned himself with his hat, and swore jovially at the ostlers, and the ostlers swore back at the coachman, and the guard, and the coach, and the horses, individually and collectively; in the midst of which confusion, little by little, I became conscious I was being watched and stared at by some one near by. Shifting my eyes, I cast them swiftly about until they presently met those of one of the four outside passengers—a tall, roughly-clad man who leaned far out from the coach roof, watching me intently; and his face was thin, and very pale, and the eyes which stared into mine glowed beneath a jagged prominence of brow.

BUT now the four fresh horses were bin and harnessed, capering and dancing with an ostler at the head of each; the driver settled his feet against the dashboard, and gathered up the reins.

"All right behind?" sang out the driver, over his shoulder.

"All right!" sang back the guard.

"Then—let 'em go!" cried the driver.

Whereupon the ostlers jumped nimbly back, the horses threw up their heads, and danced for a moment, the long whip cracked, hoofs clattered, sparks flew, and, rumbling and creaking, off went the London Mail with a flourish of the horn. As I turned away, I noticed that there remained but three outside passengers; the pale-faced man had evidently alighted.

Hereupon, being in no mind to undergo the operation of having my eye filled up, I stepped into the "Tap." And there, sure enough, was the Outside Passenger staring moodily out of the window, with an untouched mug of ale at his elbow. Opposite him sat an old

man in a smock frock, talking to a very short, fat man behind the bar, who took my twopence with a smile, smiled as he drew my ale, and, smiling, watched me drink.

"Be you from Lunnon, sir?" inquired the old man, eyeing me beneath his hoary brows as I set down my tankard.

"Yes," said I.

"Well, think o' that now—I've been a-goin' to Lunnon this five an' forty year—started out twice, I did, but I never got no furdur nor Sevenoaks!"

"How was that?" I inquired.

"Why, theer's 'The White Hart' at Sevenoaks, an' they brews fine ale at 'The White Hart,' d'ye see, an' one glass begets another."

"And they sent ye back in the carrier's cart!" said the fat man, smiling broader than ever.

At this juncture the door was thrown noisily open, and two gentlemen entered. The first was a very tall man with black hair that curled beneath his hat-brim, and so luxuriant a growth of whisker that it left little of his florid countenance exposed. The second was more slightly built, with a pale, hairless face, wherein were set small, very bright eyes, separated by a high, thin nose with nostrils that worked and quivered when he spoke, a face whose most potent feature was the mouth, coarse and red, yet supported by a square, determined chin below—a sensual mouth with more than a suspicion of cruelty.

THEY were dressed in that mixture of ultra-fashionable styles peculiar to the "Corinthian," or "Buck" of the period, and there was in their air an overbearing yet lazy insolence that greatly annoyed me.

"Fifteen thousand a year, by gad!" exclaimed the taller of the two, giving a supercilious sniff to the brandy he had just poured out.

"Yes, ha! ha!—and a pretty filly into the bargain!"

"And what of Beverley—poor deyvil?" inquired the first.

"Beverley!" repeated the other; "had he possessed any spirit he would have blown his brains out, like a gentleman; as it was, he preferred merely to disappear," and herewith the speaker shrugged his shoulders.

"And a—pretty filly, you say?"

"Oh, I believe you! Country bred, but devilish well-blooded—trust Beverley for that."

"Egad, yes—Beverley had a true eye for beauty or breed, poor deyvil!" This expression of pity seemed to afford each of them much subtle enjoyment.

All this I heard as they lolled within a yard of me, manifesting a lofty and contemptuous disregard for all, waited upon deferentially by the smiling fat fellow, and stared at by the aged man. But now they leaned their heads together and spoke in lowered tones, but something in the leering eyes of the one, and the smiling lips of the other, told me that it was not of horses that they spoke.

"... Bring her to reason, by gad!" said the slighter of the two, setting down his empty glass with a bang, "oh, trust me to know their pretty, skittish ways."

My ale being finished, I took up my staff, a heavy, knotted affair, and turned to go. Now, as I did so, my foot, by accident, came in contact with the gold-mounted cane, and sent it clattering to the floor. I was on the point of stooping for it, when a rough hand gripped my shoulder from behind, twisting me savagely about, and I thus found myself staring upon two rows of sharp, white teeth.

"Pick it up!" said he, motioning im-

periously to the cane on the floor between us.

"Heaven forbid, sir," said I.

"I told you to pick it up," he repeated, "are you going to do so, or must I make you?"

FOR answer I raised my foot and sent the cane spinning across the room. Somebody laughed, and next moment my hat was knocked from my head. Before he could strike again, however, I raised my staff, but suddenly I altered the direction of the blow, and thrust it strongly into the very middle of his gayly flowered waistcoat.

"Come, come," said I, holding him off on the end of my staff, "be calm now, and let us reason together. I knocked down your cane by accident, and you, my hat by intent; very well then, be so good as to return me my property, from the corner yonder, and we will call 'quits.'"

"No, by gad!" gasped my antagonist, bending almost double, "wait—only wait until I get—my wind—I'll choke—the infernal life out of you—only wait, by gad!"

"Willingly," said I, "but whatever else you do, you will certainly reach me my hat, otherwise, just so soon as you find yourself sufficiently recovered, I shall endeavor to throw you after it." Saying which, I laid aside my staff, and buttoned up my coat.

"Why," he began, "you infernally low, dusty, ditch-trotting blackguard—" But his companion, who had been regarding me very closely, twitched him by the sleeve, and whispered something in his ear. Whatever it was it affected my antagonist, who grew suddenly very red, and then very white, and abruptly turned his back upon me.

"Are you sure, Mostyn?" said he in an undertone.

"Certain."

"Well, I'd fight him were he the devil himself! Pistols perhaps would be—"

"Don't be a fool, Harry," cried the other, and drew him farther away, and, though they lowered their voices, I caught such fragments as "What of George?" "ruin your chances at the start," "dead shot."

"Sir," said I, "my hat."

ALMOST to my surprise, the taller of the two crossed the room, followed by his friend, stooped, picked up my hat, and, while the other stood scowling, approached, and handed it to me with a bow.

"That my friend, Sir Harry Mortimer, lost his temper, is regretted both by him and myself," said he, "but he has been a long time from London, while I labored under a—disadvantage, sir—until your hat was off."

Now, as he spoke, his left eyelid flickered twice in rapid succession.

"I beg you won't mention it," said I, putting on my hat; "but, sir, why do you wink at me?"

"No, no," cried he, laughing and shaking his head, "ha! ha!—deyvilish good! By the way, they tell me George himself is in these parts—incog. of course—"

"George?" said I, staring.

"Cursed rich, on my life and soul!" cried the tall gentleman, shaking his head and laughing again. "Mum's the word, of course, and I swear a shaven face becomes you most deyvilishly!"

Now all at once there recurred to me the memory of Tom Cragg, the Pugilist; of how he too had winked at me, and of his incomprehensible manner afterwards beneath the gibbet on River Hill.

"Sir," said I, "do you happen to know a pugilist, Tom Cragg by name?"

(Continued on page 288)

TO REMIND YOU OF WHAT HAS GONE BEFORE

PETER VIBART, brought up to riches and a scholar's life, is disinherited. His uncle leaves him a fortune if he marries Lady Sophia Sefton, a reigning beauty, while his dissolute cousin Sir Maurice, whom he has never seen, may win it on the same terms. Peter, sooner than meet the lady, takes to the Broad Highway to earn an honest living.

He is robbed by a highwayman, and in a nearby inn is accosted by Tom Cragg, a prize-fighter, who seems to know and fear him. Going on, Peter encounters a group evidently bent on a duel and the name of one, Sir Jasper Trent, sounds familiar. He follows them.

Beautiful Betty Louise

QUEEN OF ALL THE DOLLS

TWO FEET TALL

Yours As a Gift For Only 4 Yearly Subscriptions, New or Renewal

Reward No. 60CM—Betty Louise is just the loveliest doll you ever saw. Her pretty face is made of a fine quality bisque. She is not a stuffed doll, but a big live-looking beauty that will make her the royal favorite of every little girl who receives her.

Betty Louise is quite modest and dislikes to talk, but if she could talk this is what she would say about herself:

"I am about 2 feet high and have bright eyes that open and close. I have a well-made, all jointed composition body, arms and legs. If you want me to sit down, all you have to do is fix me for that position.

"I have three joints in each of my arms, the first one being at my shoulder, the second at my elbow, and the third at my wrist. My hands, dear little girls, are almost like your own. I have four fingers and a thumb on each hand, and the top of each finger is painted to give it the appearance of a finger nail.

"Long, dark brown, silky eyelashes are shown above my big brown eyes that open and close, and I have pretty hand-painted brown eyebrows. Because I am always smiling, you can see three of my pretty white teeth—another thing which most dolls do not have.

"Because I love to have little girls or their mothers fuss around and make clothes to suit me, I come dressed in only a fine quality cambric chemise, and wear a pair of pretty white

canvass slippers with white socks to match. Please make me your companion. I promise to make you happy."

Our Wonderful Gift Offer

For only 4 yearly subscriptions for American Agriculturist at \$1.00 each, we will send you Betty Louise, free, postpaid.

NOTE: If you wish to make clothes for Betty Louise, we will send you a Doll's Pattern Set, which consists of a one-piece slip-on dress, a cape, a tam-o'-shanter hat, envelope chemise and petticoat pattern for only 20 cents extra. Ask for Doll's Pattern Set No. 9821 in size 24 inches.

The American Agriculturist

461 Fourth Avenue

NEW YORK CITY

Be Ready For Emergencies

Then You Won't Be Upset When Company Comes

THE other evening about 4:30 some friends from the city telephoned to say they were coming out for 6 o'clock supper. I had a big ironing to finish and—nothing baked. And I had planned on a cold supper.

I hastily stirred up a jelly roll and prepared a mayonnaise dressing. But the jelly roll wouldn't roll. At last, in despair, I grabbed up the biscuit cutter and cut the roll in small round cakes. Then I prepared an uncooked icing by using two cupfuls powdered sugar, flavored with vanilla, and moistened with just enough milk to make it stiff. I iced the sides, top and bottom of my cakes and they looked very nice. I served cold bean salad, chicken sandwiches, sweet milk and peaches and cakes for supper. And everybody praised the cakes.

On another occasion since, I had made cup cakes for a picnic dinner. They fell in the middle, so I filled each little depression with jelly, then spread the icing over it.

Have you ever made a fruit salad, that looked dark when ready to serve? Just moisten the salad well with lemon juice, and the bananas or apples will hold their natural color. If your mayonnaise dressing persists in curdling, add an unbeaten egg white and beat hard for a few minutes. It will become nice and smooth.

Want to try something new for breakfast or lunch? Here's an experiment of mine which you may like. Take any left-over cereal, if not sweetened, and add salt and pepper, onion juice and bacon fat, together with the yolks of two eggs, well-beaten. Fry in butter, till a delicate brown.

Does your sweet milk sour easily? Add a pinch of salt to it when fresh and it will keep sweet longer.

When making cookies in a hurry, roll the dough up, in one long roll and slice off the cookies, from the end.

If your boiled custard or filling curdles or becomes watery, beat it for a few minutes, with the egg beater. Or you may take a tablespoon of cornstarch blended with a little water to the custard, and return to the double boiler; and cook two or three minutes, but it must be stirred all the time.

When the eggs are scarce and prices high, I use just half the number called for in a cake, and substitute instead one teaspoon baking powder for each egg omitted. I use grated cheese, instead of bread crumbs in breading chops or frying croquettes. The flavor is novel and delicious.

If your cream won't whip, add a tablespoon lemon juice drop by drop. It will whip nicely, and if the cream is just ready to turn, add just a tiny pinch of soda. Impossible, you say. Try my directions and see.—PAULINE CARMEN.

DISCOVER AND ENCOURAGE YOUR CHILD'S TALENT

Dropping in at a friend's the other day, I found her sitting on the floor admiring a wooden aeroplane her small son was making.

"Isn't it splendid?" she smiled, handing to me.

"I'm going to build big aeroplanes and bridges, and houses, and things, when I grow up!" Buddy exclaimed.

"Indeed he is!" the mother declared.

When six year old Buddy had returned to his playing his mother said: "Ever since Buddy was old enough to show any special interest along any line, I've tried to detect his natural gifts. He always loved building things. And I have encouraged this talent to the best of my ability. We have furnished him with plenty of building material. And I'm never too busy to stop, look, and admire."

"You're right," I replied, very much interested. "Plenty of talent has been left to die because of lack of interest on the part of the parent."

"I had a cousin," the mother continued, "who would have been a famous painter, but for his father, who, was always saying: 'No artist son for me. I want a regular boy.' When Joe begged to be sent to an art school, where he could express the beauty hidden away in his soul, the father re-

fused, and packed him off to a military academy. Of course, the boy is a failure. He never accomplished anything. So—I'm trying hard not to be that kind of a parent."

After I left, I thought how wise Buddy's mother is. How much talent has been lost to the world, through the stupidity, carelessness, and thoughtlessness of parents! So let us study our boys and girls, encouraging and developing the talents they possess.—HELEN GREGG GREEN.

"DO YOU KNOW THAT—"

The mica in stoves can be made clear by washing with vinegar slightly diluted? If the black does not come off immediately, allow the mica to remain in the vinegar a short time.

ANOTHER A. A. BABY

When this picture of Mary Elizabeth Pollard was taken, she had reached the advanced age of seventeen months. Mary Elizabeth then weighed twenty-three pounds. She had twelve teeth when a year old, has never been ill and is quite a young adventuress in the matters of walking and talking.

Her father, Ray F. Pollard, manager of the Schoharie County Farm Bureau, says briefly of his offspring. "she is at present more interested in the rubber hose than in silk ones." We warn Mr. Pollard, however, that his day of providing such luxuries won't be long in coming.

The Broad Highway

(Continued from page 287)

"Tom Cragg! well, I should think so; who doesn't, sir?"

"Because," I went on, "he too seems to labor under the delusion that he is acquainted with me, and—"

"Acquainted!" repeated the tall gentleman, and immediately hugged himself in another ecstasy.

"If," said I, "you will have the goodness to tell me for whom you evidently mistake me—"

"Mistake you!" he gasped, throwing himself upon the settle and rocking to and fro, "ha! ha!—mistake you!"

Seeing I did but waste my breath, I turned upon my heel, and made for the door. As I went, my eye, by chance, lighted upon a cheese that stood at the fat landlord's elbow.

"That seems a fine cheese!" said I.

"It is, sir, if I might make so bold, a noble cheese!" he rejoined.

"Then I will take three pennyworth of your noble cheese," said I.

"Cheese!" faintly echoed the gentleman upon the settle, "three pennyworth. Oh, I shall die, positively I shall burst!"

"Also a loaf," said I. And when the landlord had cut a generous portion and had wrapped it into a parcel, I put it, together with the loaf, into my knapsack, and giving him "Good day!" strode to the door.

And when I had gone a little way, chancing to glance back over my shoulder, I saw that the Outside Passenger stood upon the inn steps, and was staring after me.

(To be continued)

Use Wax For Making Art Novelties

Pretty, Inexpensive Gifts — Indoor Plant Growing — New Patterns

If you want something suitable for a gift, for home decorations, or as means of earning a little pin money, it will be hard to find anything better than those little articles which are so quickly fashioned from sealing wax.

Indeed even a schoolgirl can safely undertake the making of these articles. The greatest difficulty lies in the selection of suitable colors. There must be harmony in this work as in anything else in the line of art.

With an eye for color, you can easily choose the most suitable. If you want a set of beads for a blue dress, for instance, select colors which contrast or harmonize well with it. Use a little foundation of the work and as many blue for the decoration or for the contrasting colors as desired, making your beads gay or decorous as you wish.

Beads, pins, buckles, brooches and hatpins are used for personal adornment. Dainty trays, toilet accessories, curtain clips, vases and many other articles are turned into things of beauty by the aid of a little sealing wax.

You will need a hot flame, something like an alcohol lamp, for melting the wax, a small penknife for shaping the flowers, a basin of cold water for cooling the wax, and small sticks of wax in different shades and colors.

Have You Seen the New Curtain Clips?

You might start with a pair of curtain clips, which make a good gift or can be used in your own home. They are also a good article to sell if you are interested in the commercial side. They bring a good profit at thirty cents a pair.

Use the common snap clothespins for the foundation. Paint these a color to harmonize with the room they are intended for. If you are doing the work in large quantities they may be strung on a piece of string and dipped to hurry up the work. The paint should be thinned a trifle with turpentine if you are going to dip them. They must be left until entirely dry before beginning the wax decorations. First drop three large drops of hot wax at regular intervals along the side of the pin. Use a light shade of the color desired for these roses. In center of these put one drop of a darker shade, and with the point of your knife shape these drops

FOR THE GROWING GIRL

A PRETTY dress for best or everyday is No. 1776, which is also very well adapted to a make over. It comes in sizes 6, 8, 10 and 12 years. Size 8 requires 1 3/4 yards, 36-inch material, with 1 1/2 yard contrasting. Price 12c.

Order from Pattern Department, American Agriculturist, 461 4th Avenue, New York City, and be sure name, address and numbers are clearly written.

to form a tiny rose in each place. Use green to make tiny leaves around the roses and your clip is complete.

Yellow roses on blue paint, pink roses on light blue paint, dark red on slate, pink on silver or green, maroon on champagne, or white on blue or black, are some of the many combinations.

Old Hatpins Made New

Hatpin ends are quickly covered. Take a small ball of wax of the color you wish your foundation, and an old hatpin. Soften the wax over the hot flame and place on the head of the pin. Form into any shape desired, and when you have it nice and smooth dip it into the water to cool. If you have any pretty little button, bead or jewel, it may be pressed into the top of the warm wax before it is cooled and will have a perfect setting.

Now take some contrasting colors and after heating a stick, touch lightly at different points on the wax foundation with each color. Warm over the flame and by turning the ball in different directions cause the wax to run around over the ball and form odd patterns. If you wish an oriental pin to match a blue hat, make a blue foundation and touch with silver, gold, jade, amber and bronze. As soon as the colors have run enough to decorate as desired, dip the ball into the cold water and harden.

Other Possibilities for Wax Decorations

If your pin tray is tarnished or old, give it a coat of thin hot wax and some dainty decorations and see how gay your dressing table will look.

Make a pretty string of beads for that dark gown and everyone will wonder where you got them and want you to make them some.

Use an old knitting needle to make beads. Cut off a piece of wax as large as you wish the bead and slip it onto the pin, which has been heated a trifle at the point. Hold the wax over the flame until it becomes soft and then mold into the shape desired.

As soon as the bead is the desired shape it should be plunged into the cold water and hardened. Then decorate the same as for hat pins.

An old brooch and belt buckle might be decorated to match a hatpin and a string of beads, and form an exceptionally pretty and useful gift or make your old dress look like a new outfit.

If you are careful not to get the foundation too warm, you can transfer an old vase into a thing of oriental

A PRETTY EVERYDAY APRON

A N attractive apron design is No. 1905, shown in the picture in figured chintz. It is becoming as well as a protection to the dress beneath. No. 1905, cuts in sizes 36, 40, 44 and 48 inches bust measure. Size 36 requiring 1 1/2 yards 36-inch material with 6 1/4 yards binding. Pattern 12c.

Order from Pattern Department, American Agriculturist, and if you send coins, wrap them carefully. Stamps are safer. Add ten cents if you wish the Fall and Winter Pattern Annual.

beauty, and as cold water is always used for flowers the wax would not become melted.

It is surprising the many things which you will wish to fix up when you start doing waxwork. It is also surprising the number of your friends who will decide to have something of theirs fixed if you are willing to do it at a reasonable profit.

A short advertisement should be inserted in your local paper if you wish to secure orders, or arrangements might be made with a local store to exhibit some samples of your work and take orders for you.—LELAH FOWLER.

WATERING AND FEEDING HOUSEPLANTS

Watering is the most particular job about flower growing, and feeding is not far behind. Lack of an understanding of either of these is likely to cause failure—feeding from too much and watering from either too much or too little.

You cannot grow good plants and water or feed by rule. You have to examine each pot of soil and see whether water is needed. Dousing a

little every day has ruined many a collection. Before feeding be sure the plant is in good health, for a sick plant will be made sicker by more plant food. Neither is it safe to give plant food in solution when the soil in the pot is very dry, for the plant gets an excess of plant food with the extra amount of water it will draw up at once. The soil should be slightly moist at least.

Few plants will stand a sour soil, and this is sure to result if the surface is kept wet by frequent watering even when the ball of soil may be so dry as to prevent root action. The best way is to soak plants up from below, setting the pots in two or three inches of water, just deep enough to make it come up to the soil over the drainage, and not deep enough to fill the soil so full of water that it will wash away as the water drains out. The soil should be soaked by capillary action as in a lamp wick, but this will be very slow if the water does not reach above drainage material, while if the water comes up to the rim, water is forced up into the soil and this is detrimental.

For feeding, many prefer prepared plant food and should follow the directions. Ammonia is a good plant food for making foliage deep colored,

FOR THE LITTLE BOY

A CUNNING little suit for a boy is No. 1123. It has straight trousers and a frilled waist, though the blouse may also be made plain. The pattern cuts in sizes 2, 4, and 6 years. Size 4 taking 1 1/4 yards 36-inch material for waist and 7/8 yard for trousers. Price 12c.

Order from Pattern Department and enclose 10c extra if you wish catalogue.

and nitrate of soda is another as good. Use a teaspoonful of either of these, to three pints of water at first and a quart later. Once a week is often enough and once every ten days at first.—RACHAEL RAE.

Little girls' wash dresses were worn with belts slipped around. My girls continually had the most of the dress toward the front. Now, I am cutting the belts in two and sewing them at the sides, in apron fashion, to keep the gathers back. They can be tied at the side or in the back.

What Is This Dress Worth?

Before you guess I want you to know that the dress sparkles with richest style—a duplicate in design of an expensive Parisian gown at a price you will hardly believe possible!

By Virginia Castleton
Visualize yourself in this beautiful frock of soft, shimmering Egyptian silk Paisley and Navy Blue Longwear Gabardine Serge! See yourself the envy of all in this lovely creation showing the deft touches of gifted French designers. Recreated under my personal direction.

Mannish type collar, tiny vestee (button trimmed) and cuffs of Serge. Soft all around girder with loose tie sash. The beautiful skirt has the newest touch—8-inch knife pleats all around—a feature found on all of the new importations. Waist and skirt both cut full for perfect fitting to all types of figures—a clever feat of tailoring! Even older women may wear it!

And Now for a Pleasant Surprise!

What is my price? Might I ask you \$9 or \$12 or \$77? Is such elegant style not worth it? But, my dear, you shall not pay a single cent additional for the extras in style, because my price is only \$3.89! Yes, that is all. Would you ever dream it possible? But you will not fully believe or appreciate until you see it. Try it entirely at my risk—because my company guarantees you absolute satisfaction! But be quick! This amazing offer can't be open long. And I do so want every woman in America to have one.

SEND NO MONEY

Just write me giving your size. I will then send you this fine dress. Pay the mailman only \$3.89 and postage when it arrives. Try it on and then if you don't think it the most lovely dress you ever saw and the biggest bargain of your life I will return every cent of your money.

NEVER DISAPPOINTS

Reviewing the Latest Eastern Markets and Prices

AFTER THE HORSE IS STOLEN

HERSCHEL H. JONES

THE American Agriculturist has been receiving a large number of complaints from small egg shippers who have been victimized by "fly-by-night" egg dealers, who send out appealing letters promising all sorts of things if the shipper will only consign his eggs to them. One of these firms, D. Lawson & Company, 55 Rutgers street, is an example. This concern sent letters to shippers whose names he obtained from some source, promising empty egg cases free, remittance on the day of arrival, assumption of responsibility for all damages and better prices than the shipper is now receiving. The firm even mentions that they would pay 2c more than the average market.

Why any farmer or egg shipper would accept such statements from a strange concern without any investigation and send their eggs to them is hard to understand. But, nevertheless, apparently dozens or possibly hundreds of people have done this. Several other firms are being investigated by us who have sent out similar letters of appeal.

It is almost impossible to do anything for a shipper after such a concern has received and disposed of his eggs and gone out of business. The important thing is to prevent other people doing the same thing. Locking the barn after the horse is stolen does not help much, but if you have other horses in the stable it may save the others.

Investigate Before You Ship

One important thing that an egg shipper should bear in mind in selecting a receiver to handle his eggs is to investigate before he ships. In the first place, no small shipper should send eggs to an unknown concern that is not licensed and bonded by the State Department of Farms and Markets. No responsible concern that engages in receiving express shipments of eggs will avoid the State law relative to licensed and bonded commission merchants and once you have shipped to such a firm especially if it is clearly understood that it is a commission transaction you have all the protection which the State laws and the Department of Farms and Markets provides, for shippers of farm products. If you ship to unlicensed receivers without any clear understanding as to how your eggs are to be handled, you may remove yourself entirely from its protection.

In addition to finding out whether such a firm is licensed and bonded it would be well to write to the State Department of Farms and Markets, New York City office, 53 Park Place, and find out whether a firm is reliable before shipping, enclosing with your request for information the circular letter sent you. As an extra safeguard it is also well to secure from the receiver, bank references and write to his bank for information as to the credit standing and reliability of the concern.

A Favorite "Stall"

All of these are things that should be done before you ship. Most of the frauds on the part of egg receivers in the New York market are perpetrated against small shippers. The favorite appeal to such shippers is the idea of eliminating the middleman and selling direct to a firm that has a retail outlet. The only conditions under which it is safe for a poultryman to ship direct to a retailer or small dealer is when he knows that dealer personally or is near enough to New York City to investigate personally when anything goes wrong. What the responsible and honest commission house does is to protect your interest and act as your selling agent, and even though the prices so obtained may not be as high as those offered by some small retail concern, the added safety of shipping to licensed commission receivers is to be considered.

APPLE MARKET VERY WEAK

The combination of warm weather and heavy receipts in all the large eastern markets has produced a very depressing effect on the apple market. New York, Philadelphia, Pittsburg, Boston and other markets of the East were all over supplied with apples, espe-

cially of the lower grades last week. A comparatively small percentage of really fancy barreled apples brought good prices but the bulk of the shipments were of ordinary quality including many B grade and unclassified which were hard to move at any prices, even at \$2.50 per barrel. There was little outlet for much of this fruit in the New York market except among pie bakers. Quite generally prices asked at shipping points were higher than prices at which apples were sold in the large markets. Baldwins were moving heavily from Western New York and Hudson Valley last week. Most of them going into cold storage. F.O.B. shipping point prices on Baldwins from Western New York, A Grade, 2½-inch up range from \$3.50 to 4. In Hudson Valley a number of sales were made at \$4.25 per bbl. Some Vermont and other sections offering good A Grade

ranging from \$2.10 to 2.40, per 150-pound sack delivered.

Regardless of the heavy supplies, the trade was good.

BUTTER REACHES HIGH LEVEL

The butter market reached the highest level of the season during the first part of the week under a sharp demand on the part of buyers. Some creamery scoring higher than extras, brought 48½ to 49c, while creamery extras, 92 score sold at 48 cents per pound. Toward the latter part of the week trading was practically at a standstill although prices showed no tendency to recede.

CHEESE DECLINES

The cheese market developed some unsteadiness under the influence of the Federal report, showing this year's storage holdings to be much greater

to have the tax laws equalized. No one can deny that it is unjust to lay a heavy burden of taxation on one dollar and let another dollar escape. But will these organizations which profess such kindly interest in the farmer be willing to simply play fair and give his business a square deal? They will not. Congress will indulge in large draughts of finely filtered hot air and the administrative departments will call some more conferences.

Legislatures will meet even in agricultural States and let corporation attorneys write the tax laws.

Those of us who have been in agricultural organization many years fully understand that agriculture will get a square deal when enough farmers get together to make an organization strong enough to punish unworthy representatives and the hopeful sign is that each Congress shows more people in both houses who are willing to play fair with the tiller of the soil.

The Present Outlook in the Hog Market

(Continued from page 282)

prices can be expected to drop down to a lower level. Judging from the market's recent performance that level should not be a great deal lower than last year for a number of months, at least. But it is not likely to be attractive to growers in view of higher feed costs, and should start the process of readjustment by causing fewer sows to be bred for spring litters than a year ago.

Usually these ups and downs in production go too far and such is likely to be the case, this time. Human nature is a rather constant quantity and the first signs that the process is going too far usually are not discerned by the majority. The evidence is not heeded until it is overwhelming.

Just how much of a reduction is in order, it is impossible to say. Future employment conditions will have a large influence on the amount of pork that can be sold at a profit, but a decrease in production of ten to fifteen per cent would go far toward restoring the balance once more. There is some merit in the argument that production should be reduced to a point where there would be no surplus for export in order to get the formation of hog prices out of the international trade arena where the buying power of a bankrupt Europe is so large a factor. Certainly the position can be defended that production should be reduced to a point where the amount to be sold abroad would be no more than Europe could buy at a price reasonably profitable to the grower.

Hog Production a Good Business

While the prospect for the hog grower is not very rosy for the next year, the condition is a temporary one because of the overdoing which follows undue prosperity in the business. But the business is still a good one. Always there are low cost producers who can weather such periods of low prices as the present without much loss. Barring severe economic changes which would affect other branches of agriculture and industry as well, hog production will get back on a profit-making basis again and if the usual cycle is followed, a mild hog shortage may develop in about two years.

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on October 19:

Eggs, Nearbys (cents per dozen)			
New Jersey hennery whites uncandled, extras...	80 to 84	Buffalo	Phila.
Other hennery whites, extras.....	78 to 82		
Extra firsts.....	68 to 70	58 to 60	43 to 45
Firsts.....	60 to 67		39
Gathered, whites, first to extra firsts.....	60 to 68		
Lower grades.....	42 to 58		
Hennery browns, extras.....	55 to 60		
Gathered browns and mixed colors, extras.....	50 to 54	52 to 55	
Pullets No. 1.....	40 to 53		
Butter (cents per pound)			
Creamery (salted) high score.....	48½ to 49	51 to 52	
Extra (92 score).....	48	49 to 50	49
State dairy (salted), finest.....	46½ to 47½	47 to 48	
Good to prime.....	44 to 45½	40 to 45	
Hay and Straw, Large Bales (per ton)			
Timothy No. 2.....	\$27 to 28	\$17 to 18	\$26 to 26.50
Timothy No. 3.....	25 to 26		22 to 23
Timothy Sample.....	17 to 20		
Fancy light clover mixed.....	29		26 to 26.50
Alfalfa, second cutting.....	31 to 32		
Oat straw No. 1.....	11 to 12		
Live Poultry, Express Lots (cents per lb.)			
Fowls, colored fancy, heavy.....	27 to 28	23 to 25	29 to 30
Fowls, leghorns and poor.....	19	16 to 19	20 to 24
Chickens, colored fancy.....	21 to 22	21	28
Broilers, leghorn.....	24 to 25	19	27
Live Stock (cents per pound)			
Calves, good to medium.....	11 to 13		
Bulls, common to good.....	3½ to 4		
Lambs, medium to good.....	10 to 12		
Sheep, common to good ewes.....	3 to 4½		
Hogs, Yorkers.....	8¼ to 8½		

2½-inch Baldwins at \$3.75. There was little market for B Grade Baldwins at shipping points.

Interest is very active in Greenings owing to scarcity. There are not many available for shipment now except what is in storage. Market not firmly established on Spys or other varieties now being picked in New York State. West Virginia Stayman Winesaps sold at \$4 per barrel f.o.b. shipping point. The total shipments of apples up to October 16 this season were 42,075 carloads compared with 39,381 carloads, to same date last year.

CABBAGE WEAK

Cabbage prices have been gradually going lower for some time and last week the carlot buyers in New York City bought early varieties for kraut as low as \$11 a ton loaded in the country. Some reported that they were able to buy medium Danish for \$12.

HAY MARKET WEAKER

The hay market was weaker during the past week the market being overstocked with Canadian heavy pressed hay. Prices, however, showed practically no change.

POTATOES FIRM

Potatoes were arriving in the New York Market last week from Long Island, Maine, New York and Michigan. The cooler weather helped to improve the demand. Long Islands were sold in carlots at \$3.15 to 3.25 per 150-pound sack f.o.b. loading point; bulk, \$1.10 to 1.30 bu. loaded. Maine's, mostly Green Mountains, sold for \$1.60 to 1.75 cwt bulk delivered; \$2.65 to 2.75 per 150-pound sack.

States sold in bulk for \$1.40 to 1.60 cwt delivered; 150-pound sacks \$2.40 to 2.70 delivered.

Michigan potatoes arrived at prices

than last year. The price of cheese likewise is still at a high level compared with that of butter. State Flats dropped ½c per pound and Wisconsin markets are reported lower. There seemed to be a tendency for State Flats to strengthen slightly toward the end of the week.

FANCY EGG PRICES SOAR

Prices of fancy eggs showed additional advances the last week. On October 18, New Jersey hennery whites closely selected extras sold at 80 to 84c, compared with 74 to 76c the previous week, and other nearby selected eggs 78 to 82c, compared with 72 to 75c. The decrease in consumption from such high prices is beginning to be felt by dealers. There was a slight reduction in supplies of medium grade eggs, but the market still remained dull.

LIVE POULTRY MARKET ACTIVE

Geese were wanted on the wholesale markets this week. Ducks likewise met a good demand. Prices of geese in express shipments ranged from 21 to 22c, and of express shipped ducks, 22 to 28c. Long Island ducks which supply a good portion of the New York trade had a fine sale during the week, bringing 27c per pound. Express colored fowls and chickens are meeting an active demand and prices tended upward.

The Real Trouble With Agriculture

(Continued from page 279)

missed by the assessor, but stocks, bonds, mortgages and all forms of intangible property are escaping taxation and the tangibles are required to carry the load.

It would help agriculture immensely

Does a Small Flock Pay?

Figures That Decide the Question

By H. E. COX

ON January 1, 1922, our little flock of Grade Rocks numbered sixty hens and pullets. They had comfortable quarters through the winter, with plenty of straw over the dirt floor where their grain rations were scattered. The roosts were up from the ground about forty-two inches, and were on a level. The dropping board or floor is about six inches below the roosting poles or rather flat strips of boards. This dropping board is treated each morning to a good dusting with sifted hard coal ashes. The droppings are all cleaned off weekly and stored for use as high-grade fertilizer.

There is never any trouble from lice and there is never any loss from odor of ammonia in their roosts, even after they are removed and stored. During the winter they have some cabbage or beets; in fact, anything in that line that they will eat. The first of April they are shut in a large yard, for

Ninety cents was a liberal allowance for the grain feed and we knew just what the scrap and shells cost. As no dog is kept, all the table scraps go to the poultry, and as there is a large family this is quite an item. One of the good features of the farm is, that where poultry and pigs are kept there is, or should be no waste either from the field, orchard, or table. There is no charge here for the labor, for this was a pleasure, and really required little time. A year or two ago I could not have given as good a report. A little extra attention has brought results.

STARTING WITH FIFTEEN HENS

KATHERINE PAUL

In May, 1921, we bought a setting hen, and in June hatched "Buff Orpington chickens." The last of July, we took over a small place near Boston, and

One of the points in favor of the small flock is that it turns table and garden waste into a profit, replacing expensive grains

I have found that poultry and gardening do not thrive together on the same plot of ground.

Through the summer they have an abundance of green stuff from the gardens, beginning with lettuce and spinach; later the bottom beans and softer heads of the cabbage. I also cut the tops off the beets and carrots and other root crops, not cutting too close. These soon grow up again and appear all the better for the treatment. The chard also furnished a great quantity of green feed.

The grain feed is a mixture of corn, wheat, oats, and barley. The feeding of scrap began about October 1. Very little water was used as drink as there was an abundance of it in milk for that purpose; in fact, the flock was pretty well looked after. In November, after crops were gathered, they again had the run of orchard and fields, but not the garden and lawns. A daily record was kept of the eggs produced. The grain feed was estimated.

January 1 past, I did a little figuring and there appeared to be a credit of between two and three dollars for each bird. My son said: "Why, Father, that can't be right. There must be some mistake in your figures." My reply was: "Well, Harry, perhaps I have. But there is the egg record and there certainly is no mistake in that, and you know about the prices of grains and other feed that they have had. Just do a little figuring and see what you make it." The result of his figures was not materially different from my own. They were as follows:

6,819 eggs at 3½c....	\$238.66
Six quarts grain per day equals 69 bushel at 90c a bushel.....	\$62.10
Scrap and other feed at 10c per day.....	36.50
	98.60
	\$140.06

Dividing this sum by 60 equals \$2.33 per hen.

received with it 15 hens and a White Rock rooster. All the hens were Barred Rocks.

We began to keep an egg-record on the first of August. The Orpingtons laid practically none until New Years, 1922. During the last of 1921, the average laying flock was rather less than 15 through the death of one or two. As the Orpingtons began to lay, others of the old flock were disposed of, so that the average in the laying house for the entire year, from August to August, was about 16 hens.

From this small flock we secured 2,351 eggs during that time. Of these 1,982 were sold for \$92.81. Of the remaining 369 eggs, 254 were used in the house, 18 were lost in the hen-house, 25 were given away, and 72 were used for setting. The value of these 369 is estimated at \$16.65 making the total value of eggs \$109.50. The fowls that were sold brought \$14.50. The feed cost in round numbers was \$75.00, which leaves a margin of approximately \$50.00 on a flock averaging 16 hens. This does not take into consideration, however, the labor cost on the one side, nor certain intangible profits on the other.

Several fowls were consumed in the house during the year; and a flock of young chicks, which, at the close of the egg year numbered 64, were raised for several months on the feed mentioned.

April proved to be the month of maximum production, with 341 eggs; and June the minimum, with 142 produced. In May and June, many of the hens were sitting, or hovering chicks. On one day in March and two days in April there was 100 per cent production.

"I want to congratulate you upon the great improvement which has taken place in the American Agriculturist. Enclosed please find check in the amount of one (\$1) dollar for subscription. I want to have access to it regularly."—Mr. Harold N. Humphrey, Jamestown, N. Y.

CATTLE BREEDERS

HUNT FARM JERSEYS

I offer three very choice heifers, whose Gr. dam produced in three years 46,300 lbs. milk, 2,281 lbs. fat, winning three gold, one silver and one bronze medals. Her best year's work was 18,050 lbs. milk, 938 lbs. fat and 1,126 lbs. butter. Their dams are some of my best cows. Hunt Farm Jerseys are bred for business.

Stretches five times its length!

Why live, elastic rubber
gives "U. S." Boots
longer wear

CUT a strip of rubber half an inch wide from a "U. S." Boot—and you'd find it would stretch five times its length without breaking!

Into U. S. Boots is put rubber as live as an elastic band.

Here's why this rubber means longer wear.

Every step you take, your boots bend and wrinkle. Thousands of times each day—the same strains in the same spots.

It's these strains that make ordinary rubber crack and break.

The live, tough rubber of U. S. Boots has the flexibility to stand constant bending. It stays strong and pliable—resists strain and prevents breaking.

Backed by reinforcements

Anchored in this solid rubber is layer on layer of tough fabric reinforcements. In the places where the hard strains come there are from 7 to 11 separate plies of rubber and fabric in U. S. Boots.

Reinforcements that give rugged strength—rubber that stays tough and resisting—these are the reasons why U. S. Boots mean longer wear and better service.

If you're not wearing "U. S." now—ask for a pair next time. *Get the longest wear a boot can give you.*

You'll find every type of footwear in the big U. S. line. There's the U. S. Walrus—the famous all-rubber overshoe; the U. S. Bootee, a lace rubber workshoe for spring and fall; U. S. Rubbers and Arctics—all styles and sizes for the whole family. Look for the "U. S." trademark whenever you buy.

MARKETING FRUIT IS A GROWER'S PROBLEM—By M. C. Burritt

Trail Blazers
 ALL over the Great West is written the record of the pioneers who blazed the first trails that guided civilization in its westward march.
 As settlers followed, Montgomery Ward and George R. Thorne blazed a new trail to them, being first to fill their wants direct by mail and in the complete spirit of the Golden Rule.
 Trail Blazers—Business Pioneers we were, and are. Fifty-one years have but given us experience. We stand today more alert, forward looking, searching out new methods in manufacture and trade to secure for you better goods and bigger values and greater savings.
 Trail Blazers of over fifty years ago, Montgomery Ward & Co. still cling to this spirit of leadership—we are the Oldest Mail Order House and Today the Most Progressive.

Christmas Is Just Around the Corner. So start today choosing your Christmas Gifts

20 Complete Christmas Stores in Your Montgomery Ward Catalogue

Twenty complete Christmas stores, hundreds and hundreds of gifts, everything suitable for Christmas is pictured in your Montgomery Ward Catalogue.

Toys, games, books, jewelry, all the season's novelties, all kinds of practical presents—everything to please Man, Woman, Child or Infant is offered in this complete catalogue.

If you do not know what to give, your catalogue will make you a hundred suggestions. It will be your best aid to choosing the right gift for every friend and relative.

And in this great Christmas Catalogue everything is ready now. You do not need to wait until Christmas is at hand to make your selections. You have before you now in your Ward Catalogue everything you will want to buy for Christmas.

Start Today Selecting Your Gifts for Christmas

The weeks before Christmas pass by quickly. So start today looking through your Catalogue and select your gifts carefully. There is an increased pleasure both in giving and receiving a carefully selected and appropriate gift.

There are no "Christmas Profits" in Montgomery Ward Prices

There are no Holiday prices, no "Christmas profits." You pay the lowest price of the year for every Christmas gift. You buy from Ward's Catalogue at the normal, every day price.

Your saving in buying from Ward's is, therefore, greatly increased at Christmas time. So study your Catalogue. See for yourself the saving. See for yourself how much farther your money goes, how many more presents you can buy. No one need to be omitted from your Christmas list if you let Ward's Catalogue be your Christmas guide, your Christmas store.

Order Your Christmas Gifts Early. Christmas is just around the corner

We are ready now to handle all Christmas orders. Our stocks of Christmas goods are now complete. Everything is ready. So order now.

Get out your Ward Catalogue today. Don't put it off till Christmas time. Don't wait till some things are gone.

Start today making up your Christmas list. Order early.

Marketing Fruit Is a Grower's Problem

We Grow the Fruit—Why Not Market It As Well?

IN spite of the enormous increase in fruit acreage and production in the great Northwest, especially in Oregon and Washington, and in the Southern Appalachians, notably in the Shenandoah Valley of the Virginias, New York still remains the empire fruit growing State.

In 1922, New York produced and shipped 29,993 cars of apples which was more than 26 per cent of all United States commercial apple shipments, and nearly 45 per cent of all barreled apple shipments. In addition to this it shipped 6,862 cars of peaches, or 18 per cent of the total shipments; 5,454 cars of pears, or nearly 27 per cent of the total shipments; and 863 cars of plums and prunes, or 17 per cent of the total shipments of this fruit in the country as a whole. In other words, of 175,879 cars of these four fruits shipped in the United States in 1922, New York State alone shipped 43,172 cars, or 24.5 per cent of the country's total production. It is probable that nearly three-quarters of these enormous commercial shipments originated in eight or ten counties lying along the southern shore of Lake Ontario and around the Finger Lakes area to the south, as well as the counties of the Hudson Valley which are also a great factor in eastern fruit production. The importance of this area as a fruit growing region can hardly be over-estimated. Its crop more than that of any other single State in the Union influences markets and prices.

New Yorkers Can Grow the Fruit

New York is also one of the oldest and most stable fruit growing States in the Union. Many growers here have become very proficient in the production of fine quality fruit. Clean cultivation nowadays usually with tractors, spraying with from ten to twelve thousand spray rigs by skillful and intelligent men, are the chief factors in the production of these great commercial crops. There is no more independent or substantial class of citizens than these New York growers, most of whom own their farms which usually pass from father to son, to be found anywhere in the United States.

Strangely enough when it comes to packing and marketing of these enormous crops of fruit, the growers have in the main turned over their crops to speculative buyers, usually operating through local dealers, to pack and market. While the grower has a great interest in price, he makes little or no effort to get it beyond dickering with various local representatives of the buyers. It would probably not be true to say that he is satis-

By M. C. BURRITT

fied with these arrangements, but he has certainly not been sufficiently dissatisfied with them, at least until very recently, to take any positive steps to improve them.

This fact is of fundamental importance in any marketing program which is to remedy the situation. New York fruit notoriously lacks standardization. Even though New York has a reasonably good packing law, this law has not been very effective in improving the grades of New York apples, in fact,

way to do it. He must realize that improvement in fruit marketing methods lies with him and with him alone. His interest is in savings in the marketing process, in the elimination of wastefulness, and better distribution of his product; in short, in a standardized, properly graded, sized, and branded product. The grower cannot accomplish these ends except through cooperative organization.

This is the fundamental problem which must be solved before the marketing of New York State fruit can be greatly improved.

The buyer must have confidence in what he is buying. He must be able to get it in quantity. He must be able to buy the grade and size that he wants when he wants it. In order to be sure of what he is buying and that he can continue to get it, he naturally prefers to buy it under the guaranteed brand of reliable growers' organizations.

But standardization, grading, sizing and branding costs money. It calls for an organization with the necessary overhead to give an adequate inspection service for an investment in grading and sizing machinery to insure a product which can be guaranteed, for supervision, and for accounting with hundreds of comparatively small growers by whom fruit is produced.

These essentials cannot be provided without volume. Unless there is an adequate vol-

ume, the costs of supplying these services are too high to warrant their provision, and there is too little of the product to make the impression on the market necessary to offset the great volume of unstandardized stuff which is consigned to the market in competition with this high quality fruit.

Cooperative Marketing Started Ten Years Ago

All of the above facts have been recognized by many growers in western New York during the last decade, and steps have been taken to deal with the problem. It is ten years since the first cooperative marketing associations were organized in Niagara County. These were developed and brought together in a loose county association under the leadership of the Niagara County Farm Bureau and its manager, Nelson R. Peet, from 1914 to 1919. This experience and history has already been recorded in the *American Agriculturist* and need not be repeated. For four years now a central organization, known as the western New York Fruit Growers' Cooperative Packing Association, Inc., has been operating with headquarters at Rochester. For three years, or since 1921, this organization has been selling under definite contracts with its mem-

(Continued on page 303)

The chief purpose of cooperation, is orderly marketing to prevent market gluts. This picture was taken in front of Pier 17, North River, New York City. It is typical of the way apples pile up on the Hudson River docks and at the railroad terminals

many growers have declined to use it as since the law was passed, more and more growers have apparently preferred to sell their fruit to buyers "tree run," turning over to the buyers the responsibility for grading and packing. It is hardly probable that any substantial improvement in marketing methods can be looked for through the medium of the local dealer or the buyer because their interests are primarily in the profits from their transaction. Their whole object is to buy from the growers as low as they can and sell to other buyers, speculators, jobbers and wholesalers as high as they can. They are not primarily interested in the improvement of the grade of the fruit or in the marketing system. It is futile to look to the present handlers of our fruits for the necessary improvement in the marketing situation.

Up to Growers to Pack and Grade

Packing and grading quality fruit under his own brand is the grower's problem. The sooner he realizes this and takes hold of it vigorously, the sooner will the improvement come. The grower is vitally interested in improvement. He knows that the situation is bad. He wants it remedied. He is not clear and therefore not agreed as to the best

The Man and His Orchard

"I DON'T think any dairyman could think more of his cows than I do of my trees," said a western New York apple grower recently.

We have often heard familiar statements from our friends among the fruit growers. Why not? Certainly no dairyman could watch the growth of a prize herd with any more jealous care than these men care for their fruit trees. It takes a long time to grow a cow, a time of much work, of great skill and long patience; but it takes a still longer time to bring an apple tree into bearing, a longer period of work, constant attention, expense and patience. Those who succeed best among either the dairymen or the orchard men are the ones naturally who give the most of themselves to their dairy or orchard.

But how the orchard that is well cared for through the years does in the end justify the faith! Last spring at blossom time, we rode for many miles through the intensive orchard section of western New York, probably the finest fruit-growing region in the world. Last week, in the midst of harvest, we went back into the same country. Most of our farm experience has been with dairy cows and from that experience we have had a thorough understanding of all the ups and downs of raising and maintaining a good herd and producing milk. But after living for sometime in, and traveling through the apple country and seeing the hundreds of acres of beautifully cared-for orchards, we can understand, too, just why the fruit grower thinks so much of his trees.

Announcement

AMERICAN Agriculturist has made arrangements to print some fact articles about some of our cooperative associations. The first one is the feature article in this issue, written by M. C. Burritt on "Marketing Fruit is a Grower's Problem."

This will be followed by one or two more on this same association. These discussions will not be onesided for not even our coop-

erative organizations are 100 per cent perfect. No one expects that all mistakes will be avoided. There has been a perfectly natural tendency to emphasize only the successes in cooperation because of the belief that farmers cannot face facts and will lose confidence if mistakes are discussed. This is a dangerous policy. Often more progress is to be gained from studying mistakes—than successes. When things do not go well with the cooperatives, the farmer members of course know it, and nothing makes them more likely to lose confidence in the organization than not to know exactly what the trouble is.

The cooperative movement has made tremendous progress in the last few years. In this movement, eastern farmers are well in the lead, and the eastern cooperatives have now been going long enough so as to acquire a considerable amount of experience. We are going to attempt to analyze this experience in several of the different organizations, discussing both the mistakes and the successes, believing that out of these discussions farmers will get some help to aid them in making even more progress in solving their marketing problems. We would be glad to have some short letters discussing your cooperative experience frankly, but fairly. Mere destructive criticism will not be printed, American Agriculturist believes the marketing problem must be solved by farmers themselves, working together.

Charles B. Coleman

WE are saddened to know of the death of Charles B. Coleman, who was killed in an elevator accident in the Dairymen's League Cooperative Association New York office on October 22.

Mr. Coleman's home was in Goshen, Orange County, New York, where he has always lived and where he farmed it before joining the employ of the Dairymen's League.

We worked with Charlie for years and knew him well. He was a faithful and conscientious worker, a good team-mate, and a loyal friend. May his spirit forever travel the pleasant places.

An Unofficial Envoy

YOU will be much interested in the following editorial taken from the October 23 issue of the New York "Times." Mr. Morgenthau has been a regular contributor to American Agriculturist on the European situation. Probably it is safe to say that no one in America has a better or more intimate understanding of the European chaos, particularly in southeastern Europe than does Mr. Morgenthau.

AN UNOFFICIAL ENVOY.

Former Ambassador Morgenthau goes to-day on a mission which is comparable in importance with that of an official diplomat. He sails for Greece to take the active Chairmanship of the commission under the League of Nations for the settlement of refugees from Anatolia in Western Thrace and Macedonia. There are 600,000 of these exiles who, having fled from Anatolia, where their ancestors lived for generations, are now given shelter by the Greek Government and the Greek people. More than a million acres of land (vacant lands and crown lands) have been deeded by the Greek Government to this use. The Greeks have undertaken to attempt to raise among themselves £1,000,000. The British have made a temporary loan of £1,000,000. And it is hoped to sell long-term bonds in the total amount of £6,000,000 for the constructive work of setting up these refugees in agriculture and elementary industries. This great public enterprise is to be carried forward under the direction of a committee of four members, named by the League of Nations, Mr. Morgenthau being the designated Chairman.

The United States Government is in no way obligated to help forward this beneficent enterprise Mr. Morgenthau goes in a private capacity. But he will have back of him the good-will of a great body of citizens who feel that we should cooperate in every possible practical way to help a people who

have, with all their mistakes, behaved most hospitably and generously toward others in distress. While the Red Cross and the Near East Relief and some other organizations have given a helpful hand since the great Smyrna disaster, the Greeks themselves have given far more than all outside agencies—as two to one—in providing for these exiles, some of whom have no more claim upon the hospitality of Greece than upon that of the rest of Europe or of America.

It is a work of rehabilitation which ought to succeed, not only for the sake of those who will be directly aided but also because of the wholesome general influence which such a successful effort would have. What is needed is not another Deucalion and Pyrrha incident in Greece, for she is overpopulated. Ceres needs to be propitiated with seed, plows and harrows and other agricultural implements. The very valley in which Alexander the Great was born needs to be conquered by agricultural industry. If this is accomplished the flight of the refugees to Greece may turn out to be a blessing for that disturbed, historic land.

Watch Out!

THE Protective Service Bureau of American Agriculturist has been besieged lately with letters from our subscribers asking help in the collection of money due for eggs and other produce shipped to unreliable commission men. Last week we called particular attention to this on our Market Page.

There seems to be a regular flood of shysters who open a place of business for a few weeks and advertise to farmers that they give great returns for produce shipped to them. They operate for two or three weeks, receive a lot of produce, fail to make returns on it and then disappear, perhaps to open another place of business under a different name later.

Therefore, *Under no conditions should farmers ship produce of any kind to commission men who are not regularly licensed and bonded by the New York State Department of Farms and Markets.* A list of such commission men will be furnished by American Agriculturist upon request or by the New York State Department of Farms and Markets.

A Wedding in the Family

WE are pleased to announce the wedding of Mr. Birge Kinne, Advertising Manager of American Agriculturist, to Miss Margaret Covell, on October 27.

Mrs. Kinne is the daughter of the dean of the College of Engineering of the Oregon Agricultural College. The hundreds of friends of the young couple will join with us in wishing them all possible happiness in life's finest relationship.

Eastman's Chestnuts

BOTH men who figure in the following story will deny it vigorously, but the more emphatic their denials, the more certain you may be of its truth.

Rush Lewis, who is known in dairy sections as the "Billy Sunday" of the Dairymen's League, was traveling one night on a sleeping car from New York to Utica. On the same car was H. J. Kershaw, director of the League from Chenango County, also known from one end of League territory to the other as a faithful fighter for the farmers' best interests.

The two men were in the little smoking compartment having a visit before retiring. Present also was the negro porter in charge of the car. Presently, Mr. Lewis interrupted his conversation with Mr. Kershaw to say to the porter: "My feet are asleep. I wonder if you would mind if I took my shoes off?"

"No, suh; no, suh," said the porter. "Go right ahead, boss."

So Mr. Lewis removed his shoes.

Shortly after, the men noticed that the porter was showing signs of great discomfort.

Finally he said to Rush: "Pardon me, boss, but dem feet ain't asleep; dey's dead!"

Thrills in the Dairy Business

Saving a Baby's Life Was One of Them—A Wednesday Evening Radio Talk

THE dairy business looks very commonplace to the outsider, and its exacting daily demands upon the time and attention do certainly tend to grind out the enthusiasm of those engaged in the business—be it on a lonely farm back in the hills or in a pasteurizing plant in a great city.

But there are some thrilling moments even in a dairyman's life, and some exalting ones, too. I shall never forget the first time that I fully realized how very, very closely connected with the health—yes, with the very life—of our children is the cow in some far-away pasture.

I was managing a large farm in Chester County, Pa., producing a special grade of milk for the Philadelphia market. A son of a neighboring farmer had settled in a little suburban town between us and the city.

He called me on the phone one night and begged me to send him daily some bottles of milk from our herd. His first-born was deathly sick and the doctor had found that the local milk supply was not of such a quality that the baby could assimilate it. We sent the milk in a special iced case and my thrill came later when the proud parents called on us to show us their flourishing offspring and to give the milk from our farm all credit for the result. Yes, folks, there was satisfaction in that moment sufficient to pay for all the care and toil that our family had put into our business, day after day and year after year.

All this, of course, happened many years ago. The baby is a full-grown man. To-day, thanks to the prompt application of scientific discoveries to the milk business in all our cities and towns, we can get plenty of good, nourishing milk for our babies and ourselves from any reputable milk dealer or milk company. But the thrill remains with me. It stands out in my memory even above my first pair of trousers. It is more satisfactory even than when, as a seven year old, I proudly displayed about a pint of milk that I had wrung from the reluctant teats of a patient old brindle, to whose tender mercies I was intrusted that I might "learn to milk."

But the milk thrill which I will remember longest came this fall when the Dairy Council, with which I have been connected for three years, acted as host for one day to the World's Dairy Congress during its visit to Philadelphia.

What is the Dairy Council? Organized, financed, managed and operated in a cooperative way, the Dairy Council furnishes a medium through which to extend a knowledge of the food importance of milk and milk products, and through which there can be an interchange of viewpoints on the part of producer, distributor and consumer.

The Dairy Councils in the United States operate as national health agencies, with branches and local group affiliations in all parts of the country. The councils derive their funds from subscriptions by the various dairy interests. They cooperate in

By **R. W. BALDERSTON**
Secretary, Philadelphia Inter-State Dairy Council

health education, local and national, and institute and stimulate many new movements, placing particular emphasis, quite naturally, on proper nutrition.

Their educational platform covers the eight "health rules," but for the sake of efficiency they specialize in methods of teaching children and adults proper food selection.

Because of this broad platform of the Dairy Councils, their work has the support and cooperation of national and local health organizations throughout the land.

In June, 1923, the Dairy Councils had 102 selected and specially trained workers in carrying out their program. These were

Jennie, a pale listless girl, when weighed was 17 pounds or 15½ per cent underweight. She entered a nutrition class in the spring. After ten weeks she had gained only one pound, but that was the start. She gained slowly, but steadily from then until school closed. Her mother "carried on" with her during the summer and in September when she returned to school she not only had put on 17 pounds, but had become an active, alert, happy girl.

Health plays are utilized through the Dramatic Department to arouse interest in and to stimulate enthusiasm for health practices. Many permanent health projects have resulted from these performances. The wide distribution of milk lunches in the schools can be traced in many cases to health plays.

In Atlantic City, after the "Milk Fairies" play, the consumption of milk by school children doubled in one week.

In addition to performances in schools, health plays have also been given in department stores, industrial plants, with Girl Scouts, Y. W. C. A., Y. M. C. A., and nutrition camps.

So, you see, October 4, 1923, was a red-letter day for the dairy industry—particularly the fluid milk part of it, of Philadelphia and the vicinity. On that date literally the whole world, in the person of delegates to the World's Dairy Congress, came to our old city to see the work of the Dairy Council and particularly of the Philadelphia Inter-State Dairy Council, the local unit of the National Dairy Council movement. Every

minute of that day—from 7 A. M. to 11 P. M.—was taken up by the actual demonstration of some phase of the work. The morning session in the large auditorium of the Furness School showed the healthwork of the Dairy Council with school children and the intimate connection of milk and child health. Miss Sally Lucas Jean of the American Child Health Association, came over from New York and explained why the Dairy Council is, as it should be, a recognized health agency, and various council workers explained details of methods and the results of three years of work—measured in terms of improved child health, adult efficiency and a fuller realization of the necessity of people consuming enough of milk and its products.

In the evening you may have heard broadcast the speeches given by Governor Pinchot and others at the international dinner to 1,000 delegates and their families and friends from all over the world.

That was a thrilling day for the milk producers and milk distributors of Philadelphia, for it proved to them that they had exercised sound judgment when at the suggestion of the Inter-State Milk Producers' Association, a local Dairy Council had been formed. Their pioneer work had borne fruit.

"I consider the American Agriculturist the best farm paper I can take."—ARCHIE C. STEPHENS, Greenwood, N. Y.

No use talking, the older generation could spell and cipher better than the present. Emphasizing the importance of spelling by bringing back the old-fashioned spelling bee, is to be highly commended

operating in the following well defined fields of activity:

1. Nutrition Department, conducting demonstrations of milk dishes, lectures and talks, poster and recipe contests, and special classes of undernourished children.

2. Quality Control Department, engaged in educational work with the milk producer and dealer to improve the quality of our dairy products.

3. The Department of Health Dramatics, specializing in plays, stories and talks which emphasize the use of milk and the other health rules.

4. Publicity Department furnishing magazine and newspaper articles and directing advertising work with posters, billboards, newspapers and motion pictures.

The Dairy Council is now recognized by all branches of the dairy industry as the one educational organization through which the interests of all identified with the industry are promoted.

It is impossible to estimate adequately the results of Dairy Council work at the end of a three year period, since its methods are such that the effect of its efforts are continuous and cumulative, but we can, however, point out a few incidents which portray the results of some of our activities. Nutrition classes particularly emphasize results in improvement of health in the individual child. One example out of many thousands will be given here:

Feeding the June Way at Juneway Farms

They don't have June all year 'round up at White Bear, Minn., where Juneway Farms is located. But they do the next best thing—they approximate June pastures as nearly as possible by mixing up a ration which contains June-pasture nutrients. And they feed it all year 'round. This is what resulted, last year, among the Juneway Holsteins:

Cascade Pauline Mercedes made herself World's Champion senior 4-year-old, 305-day class, with 25177 pounds milk, 1024.94 pounds fat.

Heilo Oak Korndyke became World's Champion 2½-year-old butter cow, 305-day class, with 719.82 pounds fat.

Beauty Madrigal Butter Maid produced over 20,000 pounds milk in 305 days.

All three carried calves during their tests.

BUFFALO CORN GLUTEN FEED is a substantial part of the ration fed to these cows. **BUFFALO** furnished most of the milk-making protein that helped make the above records.

Mix up your ration with **BUFFALO** if you want consistently high production without sacrifice of good health.

A Chat on Apple Varieties

For the Man Who Has an Acre or So, or Less

MANY of our fruits, and more of our

vegetables are strictly modern (the tomato, for instance which is both, has been really commercialized only two generations). But the apple has been in circulation ever since passing one at the wrong time broke up the party in the Garden of Eden.

A half-dozen quarters of old Earth claim to be the original territory. Several varieties of wild apples are still growing on the Tartar Steppes of Central Asia, and there are at least two distinct botanical types indigenous to North America.

The coming New York Fruit Show is bound not only to make a lot of stir, but to yield a crop of new enthusiasts over apple growing, and this is well. There is no safer money crop for the careful agriculturist than a "special" in fruits, and no fruit more reliable than the apple. Finally, the apple is not being over-planted despite assertions to the contrary from alarmed orchardists already in the game up to their elbows.

If the people of the United States could get good apples the year round (as they are entitled to them) at fair prices (which they are also entitled to) many a one would eat four where now they eat but one—I had almost said fourteen.

Heavy Plantings Looked For

It is certain that this fall and next spring that there will be more new apple plantings than in any twelve months since 1913—ten years ago. This discussion following is intended to help the average farmer, running an acre or so, the amateur just starting in, and the suburbanist who more than all others is necessarily hungry for advice. It is not directly intended as information for commercial growers. Any commercial grower of apples so headstrong as to accept advice of one person or one periodical as to what varieties to plant, is riding for a hard fall, if not for a cropper.

The commercial grower should visit other orchards, conversing with their managers. He should seek the counsel of his State college authorities, and finally take into his full confidence his county agent. With these various informations gathered and well digested he should then go ahead upon his own best judgment, although what follows will interest him so far as he is maintaining an experimental corner somewhere as every orchardist should.

North of Latitude 42.—The territory lying above the northern bounds of Pennsylvania and Connecticut is ideal for most of our winter stand-bys, and several fall apples of great value. On the other hand some of these, both fall and winter, will not do well even as far south as forty (Central New Jersey, Philadelphia, and so forth) while others that are almost never successful in the colder belt do very well indeed around the fortieth parallel.

Of course these parallels are irregular, really extending in a direction somewhat paralleling the coast. Apples that thrive in New York State should also thrive in the mountains of western Maryland, while Long Island, New Jersey and Lancaster County fruit does equally well in eastern Maryland. The State of Pennsylvania, in its various counties, will grow both lists.

With these isothermal parallels in mind then, let us venture to actually name for each season.

The Standard Varieties

North of 42.—Yellow Transparent, Duchess, Wealthy, McIntosh, Wagener, R. I. Greening, Baldwin, Spy.

Supplementing these the following have been very successful in certain localities, especially under the highest culture, but they are not as safe to plant in commercial quantities as are the above: Red Astrachan, Williams, Gravenstein, Fall Pippin, Palmer Greening, Delicious, Sutton, King, Bailey's Sweet, Hubbardson, Wolf River, Stark, Red Canada, Roxbury, Russet and Swaar.

Between 42 and 40.—As a rule any of the above-named do equally well to fairly well down to about the fortieth

parallel with certain notable exceptions such as the Gravenstein, Red Canada and Spy.

However, even the best of them—the McIntosh, Baldwin and Greening become fall apples in the lower latitudes especially when also on low altitudes—as Long Island and New Jersey.

South of 40.—Here we begin to have a permanent change, the Jonathan, Grimes, Stayman Winesap, the Newtown Pippin, York and Rome (and for summer, Rambo and Smokehouse) being standard and leading although many of the winter varieties indicated above, as suitable for the middle belt, succeed nearly as well below forty.

Special Varieties

For the experimenter and the careful gardener, especially if he be an enthusiast, the above lists may be greatly enlarged. In fact, with two or three notable exceptions such as the Gravenstein, Baldwin, Swaar and Winesap, I have so far named few or no apples of highest dessert quality, leaving it to the reader to pick them out for himself, below:

Yellow Transparent.—Early, tender, difficult to ship, seldom a commercial success.

Astrachan.—Tree very tender (canker and collar-rot) does not bear early. Brings top price. Best jelly apple.

Williams.—Poor grower, bears only alternate years and not heavily until twenty years old. No good for cooking.

Duchess.—Very, very sturdy, bears young, resists insects. An O. K. filler. Excellent shipper.

Gravenstein.—Requires high culture, best in quality, matures over long period, but gets mealy immediately after prime, should be harvested daily by jarring off onto deep mulch like Williams. Tree very tender—should be top worked.

Wealthy.—Bears young and heavily. Makes fine filler.

McIntosh.—Very vigorous grower, early persistent bearer. Only faults, too tender, scabs easy and drops.

Wagener.—High quality, but fruit knotty. Bears young. Good filler.

Swaar.—The very highest grade in quality—and the homeliest.

Stark.—Consistent bearer, fine keeper, quality only fair.

Delicious.—Disappointing, in size and color. Susceptible to scab. Requires high culture, and warm latitude.

Baldwin.—There is no (commercial) substitute in sight. It is still "the best bet" in the middle belt, but freezes out at 44 or even 43.

PROGRAM OF THE AMERICAN POMOLOGICAL SOCIETY'S MEET- ING AT THE APPLE SHOW

The annual convention of the American Pomological Society is being held in conjunction with the Eastern Apple Exposition and Fruit Show. Members on arriving should register at the 47th street entrance of Grand Central Palace.

Tuesday, November 6

10:30 A. M.—Address of Welcome—Charles S. Wilson, President New York State Horticultural Society.

Address of Presiding Officer—Dr. L. H. Bailey, New York, or Paul C. Stark, Missouri.

Report of Secretary-Treasurer—R. B. Cruickshank, Ohio.

11:00 A. M.—Breeding Fruits—Dr. U. P. Hedrick, New York.

1:00 P. M.—The Wilder Medal After Fifty Years—C. P. Close, U. S. D. A.

2:00 P. M.—The Trend in Fruit Growing in the United States—H. P. Gould, U. S. D. A.

3:00 P. M.—Developments in Fruit Growing in the Southeast—C. D. Matthews, North Carolina.

4:00 P. M.—Reports of Standing Committees.

Wednesday, November 7

10:00 A. M.—Spraying and Dusting—Prof. F. C. Sears, Massachusetts.

10:30 A. M.—Dry-mix Lime-sulphur—A. J. Farley, New Jersey.

11:15 A. M.—Lubricating Oil Emulsion—E. H. Siegler, U. S. D. A.

Spray Service That Counts

Wayne Growers Improve Quality 50% In One Year

FIVE years ago the spray information service was inaugurated by the Wayne County (New York) Farm Bureau. During the first year less than 200 fruit growers made use of this service. During the past year nearly 700 growers were on the roll. This is fairly conclusive evidence that the fruit growers of Wayne County have come to realize the value of this service that aids them in their spraying program.

Years ago, the fruit growers of Wayne County depended primarily on evaporators to handle the apple crop of the county; but during the last few years the tendency is to sell more and more of the crop in barrels. When the men were selling through evaporators there was not the incentive to produce extra fine quality fruit, but during the last few years, and especially since the apple packing law came into effect, there has been an effort on the part of every fruit grower to produce better quality fruit year by year.

Where Cooperation is Necessary

The Farm Bureau, realizing that they could be of service, has aided in this work by putting on a special fruit man who is posted on the control of insects and diseases. This special fruit man keeps the growers posted in regard to time to spray, materials to use, etc.

This system is so planned that the 675 growers can be reached within two or three hours. The plan is as follows: The county is divided into zones which takes into consideration the development of the fruit buds in that zone. Every member who applies for the service is grouped according to his telephone central and regrouped according to the zone in which he lives. A week previous to the time that a given spray goes out, a letter is sent to every member giving him detailed information in regard to the prevalence of the disease or insects and the best known method of controlling it. The bureau also cooperates with the United States Weather Bureau and Plant Pathology and Entomology Departments of the State College, so that when a notice of a storm period is coming, and it is time for a spray to go on, the notice is sent out. One man is called up in each telephone central, and he in turn calls three more, and these three—three more apiece; relaying it on until every man in that central has been reached. Immediately following this telephone message, a follow-up postal card is sent out notifying the members that the telephone message has been sent. This checks up any failure to pass the message on because of the telephone being out of order, etc.

Does It Pay?

So much for the operation of the spray service. The question on most people's mind is: "Does it pay and is it worth while." We can only go by the results that we get. In each zone, two men, one on the east side and one on the west side of the county, put on a spray on a section of their orchard each time a notice is sent from the Farm Bureau Office. We get the results from these orchards. This year, in the five orchards that have already been checked up, Mr. Irving Granger, Wolcott, N. Y., produced 89.3 per cent perfect apples in his Greening block. Hendricks Brothers of Huron produced 90 per cent perfect apples. Mr. William Hawley, Red Creek, produced 81.6 per cent perfect. Mr. Perry Shear, North Rose, produced 86 per cent perfect on his Hubbards. Hendricks Bros. on their Baldwin block produced 85.1 per cent perfect. William Hawley—81.2 per cent perfect; and Perry Shear—80 per cent on Baldwins. Mr. Charles Lembke, Lyons, produced 91 per cent A-grade of Greenings.

The above results show what results some of the men are getting. The other demonstrational orchards will run just about the same.

Each year, about the middle of August, a fruit tour is made to several of the orchards that are under supervision. These tours, during the last few years, have been very successful. This year,

By E. R. WAGNER

70 cars and 215 people took a trip of 45 miles in the county and visited eight orchards. After going around and seeing the results secured, the men follow the service more closely. This has been the case during the last three or four years. The production of good apples is absolutely dependent upon thorough spraying and spraying at the proper time. This is shown by the results secured on some of the check trees in the demonstrational orchards that received no spray whatever during the season. One of these check trees produced 97 perfect apples out of eight bushels. Another—24 perfect apples out of three bushels; a third produced only 40 perfect apples out of ten bushels; and still another produced 15 apples out of five bushels.

More Thorough Spraying Every Year

Fruit growers are doing more spraying and more thorough spraying each year; and it is adding dollars to their pockets. Last year, the Western New York Cooperative Packing Association found by careful analysis that the man, who received the spray service as issued by the fruit counties of the State, and who used it throughout the season, received 85 cents per barrel more for his Greenings and 97 cents a barrel more for his Baldwins than the man who produced apples where no spray service was given in the county.

The quality of the pack through the packing association in Wayne County this year is 50 per cent better in some cases than it was last year—due to more careful and more timely spraying on the part of the producers.

While headway has been made in Wayne County in the production of better fruit during the past few years, there is still room for improvement. There are many careless sprayers, and also growers who spray without any regard to the development of the insects and diseases. A special man who spends his entire time keeping track of insects and diseases is in a position to supply information to the growers.

The results secured during the last five years, and the increase in the number who are signing up for the service, indicates that very rapid strides are being made in producing better quality fruit.

MULCHING THE STRAWBERRY BED

Will you kindly tell me, why it is recommended that a cover of straw or some similar matter be placed on strawberry beds and what is the best material for that purpose?—J. M. C., New York.

There are many benefits resulting from mulching the strawberry bed. One of the main benefits is that a mulch protects the plants from the destructive work of alternate freezing and thawing. Furthermore, the mulch improves the physical condition of the soil. It adds plant food, smothers weeds in the early spring and protects the fruit from dirt at picking time.

The kind of material to be used for mulching depends entirely on the cost and availability. Horse manure containing a large percent of straw is perhaps one of the best materials. It is especially desirable if not too costly. It has excellent fertilizing value, and with a large proportion of straw in it, it makes a splendid mat. It is less likely to blow off as such materials as bean vines. Bean vines, cornstalks, straw marsh, hay and swale grass are all excellent materials. Very fine material, such as sawdust, is not recommended, for it will undoubtedly smother the plants.

The value of the mulch in preventing freezing and thawing is very great. It should not be understood that the mulch prevents the freezing of the plants. In fact, the plants are better off if the ground freezes early and remains frozen. The damage is done when there is first a freeze and then a thaw. As the soil freezes it expands and forces the plants from the ground. Naturally there is nothing to pull it back when the ground thaws and the roots are left exposed and are winter-killed. When there is a mulch the ground will not thaw so readily.

Kodak on the Farm

Story-telling pictures—such as Grandpa cracking butternuts—are the sort you'll always hold precious. That's sentiment. Selling pictures of your cattle, horses, sheep, or hogs; recording pictures of the comparative growth of crops from year-to-year—are the kind you want for practical use on the farm. And that's business.

Kodak gives you pictures the easiest way—as your dealer can show you—and by means of the autographic attachment, each negative is complete even to date and title. You'll be quick to put to purpose this exclusively Eastman feature.

Autographic Kodaks \$6.50 up

Eastman Kodak Company, Rochester, N. Y.

no!
It does not pay to mix your own feed!

HOME mixed feeds may be a little cheaper at the start—but they never produce anywhere near the maximum flow of milk. Add up the time lost in mixing—the lower production—and it is apparent that home-mixing does not pay!

Don't forget—it isn't the price of a pound of feed that counts; it's the cost of making a pound of milk!

Bull Brand forces the cows to the limit of their production—three and one-half to four pounds of milk for every pound of Bull Brand—which means that Bull Brand is, by far and away, the lowest cost feed you can use.

OUR GUARANTEE
Feed three or more cows on **BULL BRAND DAIRY RATION** in accordance with our directions. If the results do not prove satisfactory to you, upon application to us or any of our dealers the money paid for the feed used will be refunded.

Fair rates and good service

This country has enjoyed railroad transportation on practically a cheaper basis than any other civilized country.—*Report of the Congressional Joint Commission on Agriculture.*

Shippers of farm products on the New York Central Lines know from experience that the quality of railroad service is of greater importance than the price.

Inadequate, inefficient freight service is dear at any price. Rates that leave no margin of earnings on railroad investment dry up the sources of new capital, without which the carriers cannot provide the new equipment and facilities their shippers must have.

This necessary margin of receipts above expenditures, so vital to the life of the railroads, is a small fraction of railroad rates. In 1922 the railroads earned the largest net income in five years, a return of 4.14% on their property investment. But a reduction of 16% in the rates charged in 1922 would have taken all this net.

The Congressional Joint Commission of Agricultural Inquiry estimated that the average proportion of freight rates to the value of goods carried was 6%. If this were reduced to 5%, a reduction so small that the consuming public would detect no difference in living costs, most of our railroads would starve.

Living rates for the railroads—insuring healthy growth of railroad facilities—are vital to agricultural prosperity.

League Announces Prices—Apple Show Program

THE Dairymen's League Cooperative Association, Inc., has announced the price for November Milk. Class 1 milk entering into fluid consumption has been increased to \$3.45 a hundred for 3% milk in the basic zone of 210-210 miles from New York City. This is considerable in contrast to the price announced for the first week in October, which was \$2.98 and which was increased later on, the 16th of October, to \$3.25.

Class 2 milk, which goes into the manufacture of cream, the price remains the same as in October, which was \$2.05 per hundred pounds. The regular differentials of from 20 to 35c per hundred are in vogue depending upon the disposal of the skim milk.

Class 3 milk, which enters into the manufacture of powdered, condensed and evaporated milk, as well as hard cheeses, the price has been placed at \$2.20 per hundred pounds. Class 4 milk, which enters into the manufacture of butter and cheese, will be determined as previously, by the quotations of those commodities on the New York market.

THE PROGRAM OF EVENTS AT THE APPLE SHOW

The Eastern Apple Exposition and Fruit Show which opens on November 3rd, will be the largest apple exposition ever held in the East. It is given by the growers of Maine, New Hampshire, Vermont, Massachusetts, Connecticut, New York, Pennsylvania, and Maryland.

SATURDAY, NOVEMBER 3

Home Economics Day

Demonstrations and lectures at 2:30 and 8:30 P. M. by Miss Anna Barrows, under the auspices of the Home Economics Department, Teachers' College, Columbia University, New York City. These lectures and demonstrations will be repeated daily.

MONDAY, NOVEMBER 5

Fruit Dealers' Day

8:30 P. M.—Address, "How the Eastern Apple Grower Should Pack to Meet the Requirements of the Retail Trade." Mr. Buyer for the Great Atlantic and Pacific Tea Company.

Consumers' Day—City Federation of Women's Clubs Day

Address by Mrs. Thomas Slack, President, at 3:30 P. M.

TUESDAY, NOVEMBER 6

Teachers' and School Children's Day

Hotel Men's Day

Maple Products Day

2:30 P. M.—Conference in charge of Amos J. Eaton, President, the Vermont Maple Products Exchange and F. B. Robertson, manager, Maple Products Cooperative Association of New York.

Address, C. H. Jones, Chief Chemist, Vermont Agricultural Experiment Station, Burlington.

8:30 P. M.—Address (illustrated) on Nut Growing, Dr. Robert T. Morris, Stamford, Conn.

American Pomological Society Convention opens.

WEDNESDAY, NOVEMBER 7

New England Day

Farm Bureau Day

Apple Judging and Packing Contests by State agricultural college teams at 10:30 A. M. and 1 P. M. Contests in charge of Prof. B. D. Drain, of Massachusetts Agricultural College, Amherst. Dr. U. P. Hedrick, of Geneva, N. Y., will place the 15 classes used in the judging contest. Prizes offered by the American Pomological Society and the International Apple Shippers' Association. The contests will be filmed.

2:30 P. M.—Conference of Farm Bureau officials and workers of the Eastern States, in charge of Enos Lee, President of the New York State Farm Bureau Federation.

3:30 P. M.—Address, "The Relation of Transportation to the Apple Indus-

try," H. H. Pratt, Special Agent, Erie Railroad.

12 Midnight—A special trip through Chinatown and to the wholesale markets of New York City will be arranged. Price, \$1.25 each. (Make reservations Wednesday morning at Information Booth.)

THURSDAY, NOVEMBER 8

New York State Day

Honey Day

11:00 A. M.—Bee Keepers' Conference in charge of Prof. R. B. Willson, Extension Bee Specialist, N. Y. State College of Agriculture, Ithaca.

Addresses by Dr. E. F. Phillips, U. S. D. A.; E. R. Root, Medina, Ohio; Prof. F. H. Wilson, University of Wisconsin; J. H. Kelley, Advertising Expert.

Transportation Day

3:30 P. M.—Transportation Conference in charge of the Committee on Public Relations of the Eastern Railroads.

Address on the "Relation of Transportation to the Apple Growing Industry," Robert S. Binkerd, Vice-Chairman of the Committee on Public Relations of the Eastern Railroads.

8:30 P. M.—Address by R. E. N. Cowie, Vice-President, American Railway Express Company.

FRIDAY, NOVEMBER 9

Marketing Day

11:30 A. M.—Marketing Conference, Chairman, A. L. Clark, Chief, Bureau of Markets, New Jersey Department of Agriculture. Program will include a general discussion on the most important problems relating to fruit marketing and distribution.

Agricultural Department Day

2:30 P. M.—Conference of State Agricultural Department officials of the Eastern States in charge of Hon. Berne E. Pyrke, New York State Commissioner of Farms and Markets.

Addresses by Hon. Henry C. Wallace, U. S. Secretary of Agriculture, and Secretaries of Agriculture and Commissioners of Farms and Markets of the Eastern States.

8:30 P. M.—Address on the "Relation of Transportation to the Apple Industry," P. H. Burnett, Industrial Commissioner, Lehigh Valley Railroad.

SATURDAY, NOVEMBER 10

3:30 P. M.—Address on "The Relation of Transportation to the Apple Industry," A. S. Merchant, Agriculturist, D. L. & W. R. R.

On this day all apples exhibited that are for sale may be purchased for delivery on Monday, Nov. 12th.

Movies Every Day

Moving pictures showing the Fruit Industry in its many phases will be shown morning, afternoon, and evening during the Exposition. Among the films to be shown are:

"Apples and the County Agent," "King Apple's Enemies," "Connecticut Orchard Scenes," "Bees—How They Live and Work," "Power Farming," "Dusting Orchards and Low-Growing Crops for Insects and Fungi, and the Difficulties of Liquid Spraying."

NEW YORK COUNTY NOTES

St. Lawrence Co.—Pastures are good. Very little frost thus far. Corn is all cut and in the silos. The potato crop is very uneven. Some farmers report good yields, while others will hardly have enough for their own use. Cows are holding up well. Some farmers are putting more effort into their poultry business as shipping eggs are bringing excellent prices. It is too early to make a quotation on turkeys.—H. S. H.

Steuben Co.—On account of the excellent weather, farmers have been able to get their fall work cleared up in good shape. Potatoes are about all dug. The crop is very uneven, perhaps a little better than expected. The price offered at shipping stations at present is about 60 cents. Up to the 20th of October, the dry spell has become very serious.

A new way to shave

Quicker—simpler
more comfortable

Thousands of farmers everywhere are enthusiastic about this new way of shaving. They declare they now get in 78 seconds at home the same fine shave as in town at their favorite barber's.

And now they shave every day—it's so simple, quick and easy. No after-shave-smart—no irritations.

A wonderful razor

Men find this new way of shaving combines the very best points of straight razors (the sharp straight edge and the strop) with the speed and protection of a safety razor. All the pleasure is there and none of the old-time draw backs.

Once you adopt this quicker, simpler, more comfortable method, you'll never go back to old ways.

Razor and stropper in one

We have made a safety razor that you never have to take apart. From start to finish the blade stays in the razor.

Our strop works as part of the razor. Now you shave and strop without removing the blade. No trouble, no bother. It's simple and quick.

We spent 3 years and a fortune to produce a super-keen blade. We have processed upon it a barber's edge, the keenest cutting edge known.

Now you can enjoy at home for a tenth of a cent the same comfortable shave your favorite barber gives.

With this super-keen blade you run easily, smoothly over your face—just *one* time. Whether you use a fresh blade, or the automatic stropping device you enjoy the world's fastest shave—78 seconds from lather to towel—as millions of men have proved.

Try it, men

Buy a Valet AutoStrop Razor today—for sale everywhere—\$1 to \$25, according to finish, case and number of blades. See how this new way of shaving not only saves time, but protects the skin—a wonderful combination of speed and comfort.

Strops itself

A Year's Experience Testing Grape Varieties

GEORGE T. HUGHES

NOW that the grape season is over it may be well to review the matter of varieties. We have around five hundred vines on our farm and twenty-nine or thirty different kinds. The catalogues of the nurseries either give only the good points of each variety or our experience is an exception. At any rate there are some kinds we shall never plant again. For all around purposes the Worden is our favorite. It has all the good points of the Concord except shipping and keeping quality and that is not important with us as all our grapes are disposed of locally. On the other hand the Worden is ten days earlier than the Concord, the berries are larger and the quality is much better while productiveness is just as high. We shall never plant any more Concord. I am aware that this is contrary to the experience of many growers but under our conditions the Worden is the better grade.

We have tested quite a number of other black varieties. Barry and Herbert are very good but hardly enough better to pay on a commercial scale. August Giant is one of the best. The name is a misnomer for it does not mature in August and "the Giant" part applies to the vine and not to the fruit. It has, however, a rich meaty flavor. We shall give it a further trial.

Among the Red Varieties

Among the red varieties we have quite a number of Brighton which is so highly rated by the connoisseurs. It bears well always provided a self-fertile variety is planted near it and is one of the earliest kinds in the vineyard. It is reasonably productive but we do not find the quality grown under our conditions especially high. The flavor is rather insipid. Salem is a reasonable success although here the flavor is so peculiar that some people do not care for it. Delaware is, of course, of the highest quality but with us it is an uncertain bearer. This year we had very good Delawares, but this year was unusual. At any rate we shall not plant any more. Catawba ripens well within the frost limits and there is no better keeper as is well known. We are inclined to extend our plantings of Catawbas. Of the other red grapes Lindley has done the best for us. Iona is one of the best of all grapes but not productive enough for extensive planting. Other red varieties we have tested include Ulster Prolific, Vergennes and Lucile. The first two are high in quality but unproductive. Lucile bears abundantly but is low in quality. Jefferson we have been unable to ripen.

Niagara the Outstanding White

Niagara is still the best white grape for commercial purposes. In quality, however, it has many superiors, one of them, Pocklington which we rate very highly. It bears well with us. Two other good varieties are Martha and Empire State. To my own personal taste Diamond is the best of all white grapes but it has many serious faults. It ripens very unevenly and rots badly. It is entirely unsuited for market and we shall plant no more notwithstanding the high quality. Dutchess is another failure with us. The fruit is so subject to disease that we rarely get a good cluster.

Summing it all up for market we should plant only Worden among the black, Salem and Catawba among the reds and Niagara and Pocklington among the white varieties. It is very interesting, however, to experiment both with new kinds and with the older kinds which have been generally discarded. Once in awhile you will pick up a variety which under your particular conditions well repays the experiment.

HORTICULTURAL SOCIETY ANNOUNCES WINTER MEETINGS

The New York State Horticultural Society announces through its secretary, R. P. McPherson, that the annual winter meeting will be held at Rochester on January 15, 16, 17 and 18, 1924. The meeting will open at noon on the 15th.

The eastern meeting of the Society will be held at Poughkeepsie on February 20, 21, and 22, 1924.

WOLVERINE

Cordovan Horsehide Shoes

Wear 1000 Miles—Always Stay Soft

March 13, 1923

Please send me your catalog as advertised in Pacific Rural Press.

Would like also to know the prices of the different styles of shoes. There are two dealers in Modesto that handle your shoes but the number of different styles is limited.

I am wearing my first pair of Wolverine shoes and am finding them in many ways the most satisfactory shoes I ever wore.

I never had a pair that wore like these and these are as comfortable as when new. I want to have another pair ready when these wear out—if they ever do—and I want the high shoes next time.

Yours very truly,
W. L. BOWRON,
Route A, Box 52 Modesto, Calif.

The Planter

For winter wear, underneath an overshoe or arctic, here is the shoe. Its higher top is both comfortable and snug, and after the spring plowing is done, it is just the shoe that's needed. Ideal for planting, cultivating and haying.

Ask for
The Planter

Stays Soft in Any Weather

A 1,000-Mile Shoe—
From Tanners to You

Every man knows what it is to dry out wet shoes. The leather dries out stiff as a board, hard and uncomfortable.

Now this discomfort is ended. For, thanks to our exclusive, secret, double-tanning process the Wolverine shoe dries out after every soaking as soft as new buckskin. *This amazing shoe stays soft.* No other shoe made like it!

We tan the leather in our own tannery.

Wolverine Comfort Shoe

Tender feet welcome these shoes. They're soft and flexible as a moccasin, yet wear like iron. And so light and easy, you'll never know they're on duty. For tender feet or where you do not encounter wet weather, wear this comfort shoe.

We take selected horsehide of the superfine quality, formerly used for expensive Cordovan shoes and Cossack saddles—the toughest, longest-wearing leather known. Yet by our secret tanning process we give this wear-resisting leather the softness and pliability of buckskin. It never loses its softness—and it wears and wears and wears. For we even increase its natural durability.

Unusual Economy. Work Shoes for All Purposes

We operate our own tannery and our shoe factory as one organization. This effects very large economies. So every Wolverine shoe is very low priced when you consider the quality.

There is a Wolverine for every use. For field and shop, for lumbering and hunting, for the mines and the oil

fields. The model shown in the picture is ideal to wear under arctics. The ever-soft leather in every model assures perfect comfort always. This new-day shoe is the one all men want.

If your dealer cannot supply you we will see that you are supplied.

Hen Troubles

Curing the Egg Eater — Questions About Diseases

DO your hens eat eggs? Do you know why they eat eggs? I will answer the second one of these important questions. Your hens eat eggs for any one or all of the following reasons: They are confined too closely or are overcrowded and can't get green food; they are not fed enough oyster shell, grit, charcoal, and other shell-making materials; their nests are made of fine, scratchable material, which invites scratching and consequent egg breaking, and then egg eating; there may be too few nests, when fighting for possession will result in broken eggs; the hens may be too old and lay soft-shelled eggs; and the ration may be unbalanced.

Someone may say, "My hens eat eggs in spite of all these things. They are not overcrowded; they are fed a balanced feed with all the different shell-making materials; they are young and have the range of the entire farm. They just eat them. That's all."

Yes, I agree with such a person but, nevertheless, some one thing must have taught such hens the habit. Maybe, shells from the table and incubator, thrown uncrushed to the hens, may have started them. From our own flock, I know that the hens eat eggs sometimes when they get the chance at a broken egg on the floor or ground, or when they find an egg without a shell anywhere, but our hens are not egg eaters. More often than not, broken eggs and undeveloped eggs remain in the nests uneaten by our hens.

To make the story short, try my trick to cure the hens of this exasperating habit. Place a china egg in every nest and scatter a dozen or two promiscuously about the floor and yard. At first, change the position of those china eggs not in the nests so that the hens will not recognize them as being the same ones. Watch how those egg-eating hens pick at the china eggs. They pick and follow them as they roll about, only to give up in disgust and pass along until they come to another egg. Here the picking performance is repeated. After several days, the most persistent egg eater will have learned that the eggs cannot be eaten. But by no means remove those eggs. Leave them lie. Now, later, should an egg be laid upon the house floor or outside by any foolish hen who miscalculated her time, the chances are that it will lie unmolested. Try it. Keep them thrifty by caring for them as I have suggested, crush all eggshells fed to them fine, and I believe that your hens will become as mine are, that have the range of the farm. These, I already have admitted, occasionally eat an egg which they find where it has no business to be, but they are by no means in the egg-eating class.—R. I. WEIGLEY.

HENS AFFECTED WITH GOUT

I have a flock of hens that have been sick all winter. At first they had a cough and sneezed, but it did not seem to amount to anything. Then they began to droop around and their feet and legs would swell until they were three times the natural size. If they lived twelve hours with their feet like that, they would get along and eat more than any hens I have and would not lay. Sometimes ten or twelve would die in two or three hours. Could you tell me the cause and a cure?—N. M. R., New York.

The symptoms as you describe them would suggest a very severe case of gout. Birds of low vitality are more subject to this disease than are strong, vigorous healthy hens, well-reared stock. Gout is usually caused by a combination of improper feeding and bad housing conditions; the trouble may be started by feeding garbage, mouldy feeds or rations containing too high a percentage of protein, especially if the mash is fed moist, in which case the hens do not take sufficient exercise and usually consume too much mash and not enough grain, the mash usually containing more protein and less fats and carbohydrates than the grain.

Dark, damp or drafty houses with dirt floors are very little or no better. Where the hens stand around or huddle on the perches, coupled with improper feeding, is the cause of nearly all poultry troubles. Hens should be kept busy under comfortable conditions.

Vigorous stock, comfortably housed and properly fed, is rarely subject to troubles of this kind, in fact, troubles of any kind. A comfortable home means one that is clean, dry, free from drafts, has plenty of sunlight and is reasonably warm, with sufficient ventilation and the hens made to work in a deep, dry litter for their grain.

Give a Dose of Epsom Salts

Hens badly affected with gout should be removed from the flock and disposed of. The balance of the fowls could be given one pound of epsom salts dissolved in six or eight quarts of water for each 100 birds; no other water to be allowed them until they drink all of this. Feed liberally of a good grain mixture both morning and night; also give them all the green food they will consume at noon. Sprouted oats would be best under these conditions, and plenty of skim milk or buttermilk would also be beneficial. If one could give them all they would drink of this, the mash could be taken away entirely until the hens could run out and secure green food, then the dry mash could be resumed. If milk is not available, feed only a small amount of the dry mash at noon, keeping it before them only a few hours, then make the housing conditions more comfortable. The poultry department of your State College will furnish free on application bulletins on poultry feeding and management.—W. G. K.

LOOKS LIKE POULTRY CHOLERA

Our chickens have a disease that I do not know how to treat. Their head feathers all rise up and their combs turn black. They start with diarrhea. They seem to be hungry, but when they have eaten they droop and some die within twelve hours. The birds have clean airy houses facing the south, plenty of ventilation and no drafts. I have been feeding corn on the cob, dry bran with meat scrap and boiled potatoes. They have plenty of fresh clean water, slightly warm. They are free from lice and mites.—A. C. L., Ly-sander, N. Y.

From the symptoms you mention there seems to be two possibilities. Either the birds are suffering with pneumonia, cholera or liver trouble. In fact, we are led to believe that it is cholera. The first remedial step is to isolate the diseased birds or at least those birds showing suspicious symptoms. It is believed that there is no absolute cure for genuine cases of cholera.

If you are contemplating bringing new birds in your flock, by all means keep them separated from the diseased flock. Destroy the bodies of the dead birds, preferably burning them or burying them in lime. If your flock was seriously infected with the disease, it would be most preferable for you to move the birds to temporary quarters, thoroughly disinfecting them as well as liming the soil and turning it over.

Birds that are affected with cholera, if they do not die, will become more or less useless in the flock and a danger to new birds that may be added. It is best to destroy them immediately. It is a case of which is cheaper, infecting new birds or killing sick ones.

It is noticeable that you do not mention green food as being a part of the ration. This may be a responsible factor if omitted.

HENS HAVE ABNORMAL THIRST

I am having trouble and losing my hens. They seem to have a thirst that cannot be satisfied, for they drink water continually, get sick and in a few days fall dead. I can see no evidences of bowel trouble. Can you offer any suggestions?—G. A. C., Pennsylvania.

Abnormal thirst in fowls is due to internal fever. There are various causes for such a condition, among these is the eating of mouldy or damaged feed, garbage, poison, or poisonous weeds, or a ration containing too large a proportion of corn or corn meal.

Give one pound of epsom salts dissolved in about eight quarts of water. Do not allow access to any other water until this is used up. Feed a good balanced ration of clean wholesome feeds, and keep surroundings in a sanitary condition.

From GRASS to DRY FEED

Now, the pasture field and range must give way—to the stall and manger, the feed lot and self-feeder, the barnyard and fodder rack.

Include

DR. HESS STOCK TONIC

in the ration

You have often noticed stocking of the legs, roughness in the hair, highly colored urine—all on account of the change from grass to dry feed.

Not so where Dr. Hess Stock Tonic is fed. The Tonics, the Laxatives, the Diuretics, take care of all that. No worms; the Vermifuges settle them.

Then you are all set for heavy feeding, a good yield of flesh and milk throughout the winter.

Tell your dealer what stock you have. He has a package to suit. GUARANTEED.

Marketing Fruit Is a Grower's Problem

(Continued from page 295)

ber locals—some forty in number. As with most other cooperative organizations, which are blazing a trail and undertaking new systems of marketing with growers inexperienced in this phase of their business, many difficulties have been encountered. Some of these have already been overcome. The organization is in process of dealing with others, but there are still many unsolved problems which must be worked out.

Handling too Many Varieties For Efficiency

Not the least of the problems which this marketing organization has had to deal with is the enormous number of varieties of fruit, most of which are of small importance, but which have to be handled by someone. In 1922, this association marketed approximately 340,000 barrels of apples which included 140 varieties. Sixteen of these varieties, or the principal ones, represented 88 per cent of the shipments, while the other 124 constituted but 12 per cent.

In many respects, the bookkeeping, pooling and accounting was practically as much for the small varieties as it was for the large. Can this great number of varieties be marketed efficiently by any organization? Is it necessary or worth while to attempt it? Would it not be better to graft all the less valuable sorts to other more useful kinds, cut up the trees for fire wood, or sell the apples by the hundred weight for drying stock or ciders? Would not the association be warranted in offering contracts to its members to market their sixteen standard varieties only and leaving members to dispose of these odd, or more or less worthless sorts, himself, as the most efficient and economical way of handling them? Already the association has made progress in this problem by eliminating certain varieties in the locals and by grouping all varieties of similar sorts and values in one pool. But this does not solve the whole problem. What shall be done?

Standard Grades and Brand Adopted

The association has adopted the State grades, but has raised the standard for these grades by adopting the policy of the sizing all A-grade fruit in 1/4-inch sizes and selling it under one brand—Cataract, which has become well enough known in the principal markets so that it brings a premium over ordinary A-grade fruit. But because as yet this premium is often not large enough to much more than cover the cost of making the brands. The problem is to simplify the grading and sizing and so organize packing houses and the inspection and supervision that Cataract Brand will be made with a maximum of efficiency and at the lowest possible cost, and yet with such accuracy and dependability that it will command a constantly increasing premium in the markets. It is relatively simple to understand the need, but most difficult to put the remedies into effect with so many packing houses and so many individual growers hauling their fruit to these houses. A great deal of progress has been made by the association in solving this problem, although much still remains to be done.

The Problem of Pooling

As with many other cooperative associations, the problem of pooling is a troublesome one. There is always the question as to whether pooling should be local or central. The association has adopted central pooling as necessary to steady equal shipments and as the most equitable and satisfactory system, but there are some objections to it. This problem of pooling is particularly acute in western New York because of the large number of varieties. It is practically necessary to make at least three sizes of each variety of fruit if it is to be quarter inch sized. In addition to this, there is the B grade or domestic brand and the culls to be handled, making four or five different classifications for each variety. Since each grade and size is pooled separately, this means from three to five pools for each of the varieties, whether they are commercially important or unimportant.

Save \$4 to \$6 a ton

On Your Dairy Feed Cost and Get Equally Good Results

Dr. J. L. Hills, Director of the Vermont Agricultural Experiment Station, has recently published Bulletin No. 225, entitled—"The Protein Requirements of Dairy Cows," which is a result of 13 years' feeding experiments using an entire dairy herd. This Bulletin will interest every farmer in that it proves

Excessive Protein Feeding is Costly and Often Harmful

The Vermont Station's long series of experiments, proves the old idea that a ration must have 26% protein is all wrong. Also that high protein feeding is costly and wasteful—then, why go on paying \$4 to \$6 a ton more for excessive protein feed when you can keep this money in your pocket?

SUGARED SCHUMACHER FEED

mixed equal parts with Boss Dairy Ration or Gluten Feed or mix 3 parts of Sugared Schumacher with one part of Cottonseed Meal will give you Dairy Rations carrying from 16% to 19% protein. When fed with the usual hay and ensilage these rations carry sufficient protein for heavy, long time, safe milk production. Sugared Schumacher Feed will keep your cows strong, healthy and in just the right condition for highly profitable milk production.

Ask your dealer about Sugared Schumacher Feed and protein concentrates. This is well worth looking into. A saving of \$4.00 to \$6.00 a ton on your feed costs should not be overlooked.

(D9)

The Quaker Oats Company 1651 Ry. Exchange Bldg.
Address, Chicago, U. S. A.

It is not necessary to say more about the enormous amount of bookkeeping involved in such pooling and the details incident thereto. There are many details to be worked out before this system will be entirely satisfactory. Yet in essence it seems to be sound and right, because it gives to the grower a reward for his fruit in accordance with the quality produced.

Sales, Distribution and Finances

Any association has the option of creating its own sales agency or using an established agency. Since creating a sales agency is a long time and expensive process, warranted only by large and assured volume, and since the Western New York Association has itself helped to create a national cooperative marketing agency "grower owned and grower controlled"—the Federated Fruit and Vegetable Growers—it has chosen to sell and distribute its fruit through this channel. This means that it has at its disposal its own marketing agents paid on salary in eighteen of the principal markets of the country in which 60 per cent of its output is disposed of, and contract brokers in 122 other markets, and that a wide distribution of its shipments is secured. However, the large number of varieties which involves mixed or "drug store" cars, which must be sold usually as "rollers," the impersonal marketing system whereby the sales agents seldom ever see the fruit they are selling, the cost of this great overhead sales system, and the lack of volume have in part been responsible for net returns to the growers which have not in all cases been satisfactory. This problem continues to cause the association much thoughtful study. The question of a satisfactory sales system is by no means simple and will always be one which must have the closest attention and supervision.

It is obvious that the grading, siz-

Questions and Answers About Investments

Financial Department:—Would you be in a position to let me have some information in regards to the Lewis Oil Corporation, general offices, 165 Broadway, New York City? Furthermore I had purchased stock from International Oil and Gas Corporation and this company merged over its stock into the above company, also several other companies, so I was asked to turn my shares over to the Lewis Oil Corporation and pay 25 per cent of the total value of my shares. Do you know anything about the Revere Oil Company of Fort Worth, Texas, in regards to its present developments and its standing? V. Y., Pennsylvania.

If you have already put more money into this oil enterprise, no advice we can give is likely to be of any use. If you are only considering the additional payment in the hope of saving something on your original speculation, our advice is to charge the first cost to experience and keep your new money. Leave all oil stocks alone.

Financial Department.—Can you give me information on the following as investment securities: Gulf Realty Co., San Antonio, Tex.; Famous Players-Lasky Corp. New York; Rainbow Oil & Gas Co., Syracuse, N. Y.; Sour Lake Texas Oil Co., St. Louis, Mo.; Plain Facts Realty & Lease Pool, Fort Worth, Tex.—E. B., New York.

We have no specific information about any of the oil companies you name and we know of no oil stock we recommend for investment. For every legitimate oil company there are a hundred illegitimate oil promotions, the only object of which is to separate you from your money. Famous Players-Lasky Corporation is a legitimate corporation, the stock of which is listed on the New York Stock Exchange. It reports good earnings. Still it is not the kind of an investment we recommend. There are too many uncertain factors in the amusement business.

Capacity!

Every man who milks cows for a living knows that Capacity and the ability to profitably utilize feed mean the difference between profit and loss.

CAPACITY ENABLES HOLSTEINS --

to subsist very largely on home-grown feeds; to convert most economically large amounts of cheap roughage into milk and butter-fat; to respond readily to additional grain feed with increased production. In short, to utilize most profitably all feed fit for a cow.

Let Us Tell You the Story of the Holstein Cow.

Concrete on the Farm

Mixing the Batch—Hand vs. Machine

THIS is the third of the series of articles by Mr. Behrends on the use of concrete on the farm. In the last article Mr. Behrends discussed the subject of concrete mixtures and the adaptability of various mixtures to different purposes. This article covers the subject of mixing the batch. Success in the use of concrete depends a great deal upon how the material is mixed and placed. The subject of placing the concrete will be taken up in the next and last of the series.

By F. G. BEHREND

measured quantity of sand.

To determine the number of cubic feet of sand and gravel and the number of sacks of cement necessary for any job when using a mixture of known proportions, the accompanying table may be used, which is taken from "Concrete, Plain and Reinforced" by Taylor and Thompson.

First determine the number of cubic feet of concrete that are to be placed. Reduce all the dimensions to feet or fractions of feet so that the result will be in cubic feet.

Suppose it is desired to place a 1-2-4 mixture for a one course walk 60 feet long, 4 feet wide and 4 inches thick. The volume of concrete would be 60 feet times 4 feet times 1/3 of a foot (60x4x1/3) or 80 cubic feet. In the table under 1-2-4 mix, it is given that for one cubic foot of concrete, .22 of a sack of cement, .44 of a cubic foot of sand and .89 of a cubic foot of gravel

dump the required amount of cement and distribute it evenly over the sand. Turn the cement and sand over thoroughly with square pointed shovels enough times to produce a mass of uniform color, free from streaks of brown and gray. Such streaks indicate that the sand and cement have not been thoroughly mixed. Measure the required quantity of pebbles or broken stone and spread them in a layer on top of the cement-sand mixture. Again mix all of the materials by turning with shovels until the pebbles have been uniformly distributed throughout the mixed cement and sand. At least three turnings are desirable. Make a depression or hollow in the center of the pile and add water slowly while turning the materials. Continue the turning until the cement, sand and pebbles have been thoroughly and uniformly combined and the desired consistency or wetness obtained throughout the mixture.

Consistency a Vital Factor

Although it is impossible to state the exact amount of water that should be used since the sand contains varying amounts of moisture, it will be found that about one gallon of water will be

QUANTITIES OF MATERIAL REQUIRED FOR VARIOUS MIXTURES OF CONCRETE

Mixture Materials for One Bag Batch				Resulting Volume	Quantities of Materials Required for one cubic foot of concrete		
	Cement in Sacks	Sand Cubic Feet	Pebbles Cubic Feet	Concrete Cubic Feet	Cement in Sacks	Sand Cubic Feet	Pebbles Cubic Feet
1:1:1 1/2	1	1.	1.5	2.3	.44	.44	.66
1:2:3	1	2.	3.	3.9	.26	.52	.78
1:2:4	1	2.	4.	4.5	.22	.44	.89
1:2 1/2:4	1	2.5	4.	4.8	.21	.52	.83
1:2 1/2:5	1	2.5	5.	5.4	.19	.46	.92
1:3:6	1	3.	6.	6.4	.16	.47	.94

will be required. For 80 cubic feet, multiply these figures by eighty. The amount of materials required for this walk are therefore 17.6 sacks of cement, 35.2 cubic feet of sand and 71.2 cubic feet of gravel. The quantity should be increased by 5 per cent to allow for loss in mixing and handling the concrete, due to the light condition of cement.

Hand vs. Machine Mixing

Concrete may be mixed either by hand or by machine. With a machine, thorough mixing is easier to obtain and all batches will be more uniform. First-class concrete, however, can be mixed by hand. Regardless of which way mixing is done it should continue until every pebble or stone is completely coated with a thoroughly mixed mortar of sand and cement.

Although mixing concrete is a simple operation it often does not receive the attention it should for many failures are due to poor mixing. Regardless of what method is used in mixing it is important that a uniform mixture be obtained.

To obtain good concrete, it is essential that all materials be accurately measured. This can be done easily if a measuring box is used. Such a box should be made to hold exactly 1 cubic foot, 2 cubic feet or any other volume desired. To measure the materials the box is placed on the mixing platform or floor and filled. When the required amount of material has been placed in it, the box is lifted off and since the box has no bottom, the material remains on the platform. Cement need not be measured because one sack can be considered as 1 cubic foot in volume.

Although not recommendable, a pail or shovel might also be used in proportioning aggregates. For example, a 1:2:4 batch of concrete would be measured by taking 1 pail or shovel of Portland cement, 2 pails or shovels of sand and 4 pails or shovels of pebbles or stone. The objection to using a shovel or pail is that when the cement is emptied preparatory to measuring it fluffs up considerably thereby throwing out the proportion of cement to aggregate. The usual procedure in mixing concrete by hand is as follows: Spread out evenly on the mixing platform the

required for each cubic foot of concrete mixed. After the required quantity of water is determined for the first batch, it will be found advantageous to measure it out thereafter.

It is very important that no more water be used than necessary, as too much will reduce the strength of the concrete. Too little water will also reduce the strength and make it porous. For general use, concrete, after thorough mixing, should be wet enough to form a *quaky, mushy* consistency.

Machine mixing of concrete is of course preferable to hand mixing as a more uniform mixture is obtained. A batch should be left in the machine for at least one minute. A machine is not practical where only a small quantity of concrete is to be mixed, but if a considerable quantity is to be mixed it would be well to investigate at least a barrel mixer. Machine mixers operated by hand or by power may be obtained. A mixer must not be run so fast that the materials tend to cling to the inner surface, for to become thoroughly mixed they must be free to tumble around in the barrel.

A DOUBLE RAM INSTALLATION

Will installing a new ram beside one now in operation, and branched into present supply pipe with a "Y," give me double the water at buildings that one alone would do? Of course a separate feed pipe would be laid to each ram, but only one pipe from rams to buildings.—E. H. F., New York.

I see no reason why the plan for installing the second ram as you outline it would not work very well. The only suggestion that I would make would be to put a check-valve between each ram and the union of the second delivery pipes. The purpose of this is to prevent the first ram from causing any back pressure upon the other one. The checks should be installed so that they will prevent any water from flowing back toward the rams.

Don't forget to tune in on WEA every day except Monday and Saturday for the farm market service which is furnished by American Agriculturist and the New York State Department of Farms and Markets.

Fatter pigs & fatter profits

HOGS need animal food to build flesh and bone. Dold-Quality Digestor Tankage is 60% animal protein. Mix with grain or feed separately in hoppers or slops. Gives better results than grain alone; saves one-third cost. Tankage-fed hogs show more pounds when marketed—and more profit per pound. Experience proves it.

Only \$1,500 needed. A. B. CRUTE, 95 Chenango St., Binghamton, N. Y.

The Broad Highway—By Jeffery Farnol

CHAPTER XII

THE ONE-LEGGED SOLDIER

FOLLOWING the high road, I came, in a little, to where the ways divided, the one leading straight before me, the other turning to the left.

And at the parting of the ways was a finger-post with the words: "TO LONDON. TO TONBRIDGE WELLS. TO PEMBRY." Now as I stood debating which road I should take, I was aware of the sound of wheels, and, glancing about, saw a carrier's cart approaching. The driver was a fine, tall, ruddy-faced fellow, who held himself with shoulders squared and bolt upright, and who shouted a cheery greeting to me.

"If so be you are for Pembry, or thereabouts, sir," said he, bringing his horses to a standstill, "why, jump up, sir—that is, if you be so minded."

"Thanks!" said I.

So I climbed upon the seat beside him, and then I saw that he had a wooden leg, and straightway understood his smart bearing.

"You have been a soldier?" said I.

"And my name's Tom, and I could tell you a sight about them Spaniards, and Frenchies—that is, if—you be so minded?"

"I am so minded; fire away, Tom."

"Well," he began, fixing his eyes on the "wheeler's" ears, "Frenchies ain't so bad as is thought, though they do eat frogs, but what I say is—if they be so minded, why frogs let it be!"

"And where did you lose your leg, Tom?"

"Vittoria—I appened to be carrying my off'cer, Ensign Standish his name, barely eighteen year old. Shot through the lung he were, the fire being uncommonly 'ot there, you 'll understand, sir, and he were trying to tell me to drop him and run for it, when all at once I feels a sort of a shock, and there I was on my back and him atop o' me; and when I went to get up—there was my leg gone below the knee."

"And afterward?"

"Arterwards," he repeated. "Why, that were the end o' my sojerin', ye see; we lay in the same 'ospital, side by side, and he swore as I'd saved his life—which I 'ad n't and likewise swore as he 'd never forget it. And he never 'as either, for here am I wi' my own horse and cart, Tom Price by name, carrier by trade, an' very much at your service, sir, I 'm sure."

Thus we climbed the hill of Pembry, by tree and hedge, and lonely cottage, by rolling meadow, and twilit wood, Tom the Soldier and I.

Much he told me of lonely night watches, of long, weary marches, and stricken fields, of the bloody doings of the Spanish Guerrillas. And in my ears was the roar of guns, and before my eyes the gleam and twinkle of bayonets. By the side of Tom the Soldier I waited the thunderous charge of French Dragoons, saw their stern, set faces, and the flash of their brandished steel as they swept down upon our devoted square, swept down to break in red confusion before our bristling bayonets. By the side of Tom the Soldier I stormed through many a reeking breach, swept by fire, and slippery with blood; and all for love of it, the munificent sum of eightpence per day, and that which we call "Glory." Bravo, Tom the Soldier!

AND presently I became aware that he had stopped his horses, and was regarding me smilingly.

"Tom," said I, "you are a wonderful talker!"

"And you, sir," said he, "are a better listener, and, look you, a good listener is mighty hard to come by. Howsom-ever, here's the end o' my journey, more's the pity, but if you—"

"Tom," said I suddenly, "you never heard of Tom Cragg, did you?"

"Can't say as I have," he answered, stroking his chin thoughtfully.

"And you don't know who 'George' is, of course?" I continued musingly.

"Why, I've knowed a many Georges in my time," said he, "and then there 's George, Prince o' Wales, the Prince Regent, as they calls him now."

"George, Prince of Wales!" said I, staring; "by heavens, Tom, I believe you've hit it!" And, with the word, I sprang down from the cart.

"My cottage is near by, sir, and I should be proud for you to eat supper wi' me—that is—if you be so minded?"

"Many thanks," said I, "but I am not so minded, and so, good-by, Tom!" And, with the words, I wrung the soldier's honest hand in mine, and went upon my way.

"George, Prince of Wales!" said I to myself; "Then who had they supposed me?" Hereupon, as I walked, I fell into a profound meditation, in which I presently remembered how that Tom

Cragg had also mentioned the Prince, giving me to understand that his Highness had actually ordered him (Tom Cragg) to leave London; and why? "Arter that theer kidnappin', an' me 'avin' laid out Sir Jarsper Trent—acordin' to yer order."

Sir Jasper Trent! I stopped stock still in the road. Sir Jasper Trent! At last I remembered the name that had eluded me so persistently.

According to my orders, or rather, the orders of the man for whom he (in common with the two gentlemen at "The Chequers") had mistaken me. Put who was that man? Of him I knew, that he was much like me in person, and had formerly worn, or possibly still wore, whiskers. And beyond these two facts I could get no farther, so I presently shrugged my shoulders, and banishing it from my thoughts for the time being, set forward at a good pace.

CHAPTER XIII

IN WHICH I FIND AN ANSWER TO MY RIDDLE

THE sun was already westering when I came to a pump beside the way; and seizing the handle I worked it vigorously, then, drank and pumped, alternately, until I had quenched my thirst. I now found myself prodigiously hungry, and remembering the bread and cheese in my knapsack, looked about for an inviting spot.

On one side of the road was a thick hedge, and, beneath this hedge, a deep dry, grassy ditch; and here, I sat down, took out the loaf and the cheese, and opening my clasp-knife, prepared to fall to.

At this moment I was interrupted in a rather singular fashion, for hearing a rustling close by, I looked up, and into a face that was protruded through a gap in the hedge above me.

It needed but a glance at the battered hat with its jaunty brim, and great silver buckle, and the haggard, devil-may-care face below, to recognize the individual whom I had seen thrown out of the tavern the morning before.

It was a very thin face, as I have said, pale and hollow-eyed and framed in black curly hair, whose very blackness did but accentuate the extreme pallor of the skin. Yet, as I looked at this face, in the glance of the hollow eyes, in the line of the clean-cut mouth I saw that mysterious something which marks a man, what we call for want of a better word, a gentleman.

"Good evening!" said he, and lifted the battered hat.

"Good evening!" I returned.

"Pardon me," said he, "but I was saluting the bread and cheese."

"Indeed!" said I.

"Indeed!" he rejoined, "it is the first edible I have been on speaking terms with, so to speak, for rather more than three days, sir."

"Then, if you care to eat with me in the ditch here, you are heartily welcome," said I.

"With all the pleasure in life!" said he, vaulting very nimbly through the hedge; "you shall not ask me twice! Believe me, I—"

Here he stopped, very suddenly, and stood looking at me. "Ah!" said he gently, and with a rising inflection, letting the ejaculation escape in a long-drawn breath.

"Well?" I inquired. Now as I looked up at him, the whole aspect of the man, from the toes of his broken boots to the crown of the battered hat, seemed to undergo a change, as though a sudden, fierce anger had leapt into life.

"On my life and soul, now!" said he, falling back a step, and eyeing me with a vaguely unpleasant smile, "this is a most unexpected—a most unlooked for pleasure; it is—I vow it is."

"You flatter me," said I.

"No, sir, no; to meet you again—some day—somewhere—alone—quite alone, sir, is a pleasure I have frequently dwelt upon, but never hoped to realize. As it is, sir, having no chance of procuring better weapons than my fists, allow me to suggest that they are entirely at your service; do me the infinite kindness to stand up."

"Sir," I answered, cutting a slice from the loaf, "you are the third person within the last forty-eight hours who has mistaken me for another; it really gets quite wearisome."

"Come, come," said he, advancing upon me threateningly, "enough of this foolery!"

"By all means," said I, "sit down, like a sensible fellow, and tell me for whom you mistake me."

"Sir, with all the pleasure in life!" said he, clenching his fists. "I take you for the greatest rogue, the most gentlemanly rascal but one, in all England!"

"Yes," said I, "and my name?"

"Sir Maurice Vibart!"

"Sir Maurice Vibart?" I sprang to my feet, staring at him in amazement. "Sir Maurice Vibart is my cousin," said I.

And so we stood, for a long minute, immobile and silent, eyeing each other above the bread and cheese.

CHAPTER XIV

FURTHER CONCERNING THE GENTLEMAN IN THE BATTERED HAT

"SIR," said my companion at last, lifting the battered hat, "I tender you my apology, and I shall be delighted to eat with you in the ditch, if you are in the same mind about it?"

"Then you believe me?"

"Indubitably, sir," he answered with a faint smile; "had you indeed been Sir Maurice, either he or I, and most probably I, would be lying flat in the road, by this."

So, without more ado, we sat down in the ditch together, side by side, and began to eat. And now I noticed that when he thought my eye was upon him, my companion ate with due deliberation, and when he thought it was off, with a voracity that was painful to witness. And after we had eaten a while in silence, he turned to me with a sigh.

"This is very excellent cheese!" said he. "I never tasted one of a finer flavor!"

"Hunger is a fine sauce," said I, "and you are probably hungry?"

"Hungry!" he repeated, bolting a mouthful. "Egad, Mr. Vibart! so would you be—so would any man be who has lived on an occasional meal of turnips—in the digging of which I am become astonishingly expert—and unripe blackberries, which latter I have proved to be a very trying diet in many ways."

And after a while, when there nothing remained of loaf or cheese save a few scattered crumbs, my companion leaned back, and gave another sigh.

"Sir," said he, with an airy wave of the hand, "in me you behold a highly promising young gentleman ruined by

a most implacable enemy—himself, sir. In the first place you must know my name is Beverley—"

"Beverley!" I repeated.

"Beverley," he nodded, "Peregrine Beverley late of Beverley Place, Surrey, now of Nowhere-in-Particular."

"Beverley," said I again, "I have heard that name before."

"It is highly probable, Mr. Vibart; a fool of that name lost houses, land, and money in a single night's play. I am that fool, sir, though you have doubtless heard particulars ere now?"

"Not a word!" said I. Mr. Beverley glanced at me with a faint mingling of pity and surprise. "My life," I explained, "has been altogether a studious one, with the result that I also am bound for Nowhere-in-Particular with just eight shillings and sixpence in my pocket."

AND mine, as I tell you," said he, "has been an altogether riotous one. Thus, each of us, though by widely separate roads—you by the narrow and difficult path of Virtue, and I by the broad and easy road of Folly—have managed to find our way into Destitution. Then how does your path of virtue better my road of evil?"

"For my own achievements, hitherto," I continued, "I have won the High Jump, and Throwing the Hammer, also translated the works of Quintilian, and the Life, and Memoirs of the Seigneur de Brantôme, which last, as you are probably aware, has never before been done into the English."

"Ha!" exclaimed Mr. Beverley, sitting up suddenly, with his ill-used hat very much over one eye, "there we have it! Who ever heard of Old Quin—What's-his-name, or cared, except, perhaps, a few bald-headed bookworms? While you were dreaming of life, I was living it. In my career, brief though it was, I have met and talked with all the wits, and celebrated men, have drunk good wine, and worshipped beautiful women, Mr. Vibart."

"And what has it all taught you?" said I.

"That there are an infernal number of rogues and rascals in the world, for one thing—and that is worth knowing."

"Yes," said I.

"That, though money can buy anything, from the love of a woman to the death of an enemy, it can only be spent once—and that is worth knowing also."

"Yes," said I.

"And that I am a most preposterous ass!—and that last, look you, is more valuable than all the others. Solomon, I think, says something about a wise man being truly wise who knoweth himself a fool, doesn't he?"

"Something of the sort."

"Then," said he, flinging his hat down upon the grass beside him, "what argument can you advance in favor of your 'Narrow and Thorny'?"

"The sum of eight shillings and sixpence, a loaf of bread, and a slice of noble cheese, now no more," said I.

"Egad!" said he, "the argument is unanswerable, more especially the cheese part." Having remarked which, he lay flat on his back again, staring up at the leaves, while I filled my pipe and forthwith began to smoke.

And, presently, as I sat alternately watching the blue wreaths of my pipe and the bedraggled figure extended beside me, he suddenly rolled over on his arm, and so lay, watching me.

"On my soul!" he exclaimed at length, "it is positively marvellous."

(Continued on page 308)

THE STORY AS IT HAS PROGRESSED SO FAR

AFTER seeing a penniless young gentleman thrown from a tavern, after encountering a prize-fighter, Tom Cragg, who seems strangely afraid of him, and after witnessing a duel in which one Sir Jasper Trent is killed, Peter Vibart stops at an Inn to rest. Here an accidental encounter with two "dandies" almost leads to a quarrel until they, too, seem to recognize in Peter someone whom they greatly fear.

After buying some food, he takes again to the Broad Highway pondering on the resemblance they all seem to see, on a mysterious "George" they mention, and on his own ill fortune in being disinherited by his uncle's will, unless he marries Lady Sophia Sefton, whom he has never seen.

Brown's Beach Jacket

Keeps You Warm and Comfortable

Reg. U. S. Pat. Off.

During the war a customer said, "Brown, for Heaven's sake, how have you kept up your quality?" "Close personal supervision," was the answer.

Get the OLD RELIABLE, Brown's Beach Jacket. It wears like iron, can be washed and keeps out the cold. Three styles—coat with or without collar, and vest.

OIL LIGHT BEATS ELECTRIC OR GAS

BURNS 94% AIR

A new oil lamp that gives an amazingly brilliant, soft, white light; even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

The "Nellie" Yoke

With Lace to Match For an Edge or Trimming

USING No. 60 (or any size desired) crochet cotton, chain 94 stitches.

First Row—8 sp. 1 bl. 13 sp. 1 bl. 8 sp.

Second Row—7 sp. 1 bl. 1 sp. 1 bl. 11 sp. 1 bl. 1 sp. 1 bl. 7 sp.

Third Row—6 sp. 1 bl. (1 sp. 1 bl.) twice, 9 sp. 1 bl. (1 sp. 1 bl.) twice, 6 sp.

Fourth Row—5 sp. 1 bl. (sp. 1 bl.) 3 times 5 sp.

Fifth Row—4 sp. 1 bl. (1 sp. 1 bl.) 4 times 5 sp. 1 bl. (1 sp. 1 bl.) 4 times 4 sp.

Sixth Row—3 sp. 1 bl. (1 sp. 1 bl.) 5 times 3 sp. 1 bl. (1 sp. 1 bl.) 5 times 3 sp.

Seventh Row—2 sp. 1 bl. (1 sp. 1 bl.) 13 times 2 sp.

Eighth Row—(1 sp. 1 bl.) 15 times 1 sp.

Ninth Row—Like seventh row.

Tenth Row—Like sixth row.

Eleventh Row—Like fifth row.

Twelfth Row—Like fourth row.

Thirteenth Row—Like third row.

Fourteenth Row—Like second row.

Fifteenth Row—Like first row.

Repeat from second row. There are six of the motifs in front of yoke, which fits sizes 36 and 38.

After making sixth motif, slipstitch down 14 spaces from top of yoke, and make one underarm section as follows:

First Row—7 sp. 1 bl. 1 sp. 1 bl. 7 sp.

Second Row—6 sp. 1 bl. (1 sp. 1 bl.) twice, 6 sp.

Third Row—5 sp. 1 bl. (1 sp. 1 bl.) 3 times 5 sp.

Fourth Row—4 sp. 1 bl. (1 sp. 1 bl.) 4 times 4 sp.

Fifth Row—3 sp. 1 bl. (1 sp. 1 bl.) 5 times 3 sp.

Sixth Row—2 sp. 1 bl. (1 sp. 1 bl.) 6 times 2 sp.

Seventh Row—(1 sp. 1 bl.) 8 times 1 sp.

Eighth Row—Like sixth row.

Ninth Row—Like fifth row.

Tenth Row—Like fourth row.

Eleventh Row—Like third row.

Twelfth Row—Like second row.

Thirteenth Row—Like first row.

Fourteenth Row—8 sp. 1 bl. 8 sp.

Repeat from first row. There are two of the diamond motifs in underarm section. After thirteenth row of second motif is completed, chain 43, and repeat from first row of front, making six more large motifs for back, and two small ones for other underarm section. Join neatly. Fasten thread in at one corner of top of yoke front, and proceed as follows:

First Row—7 sp. 1 bl. 7 sp.

Second Row—6 sp. 1 bl. 1 sp. 1 bl. 6 sp.

Third Row—5 sp. 1 bl. (1 sp. 1 bl.) twice, 5 sp.

Fourth Row—4 sp. 1 bl. (1 sp. 1 bl.) 3 times 4 sp.

Fifth Row—3 sp. 1 bl. (1 sp. 1 bl.) 4 times 3 sp.

Sixth Row—2 sp. 1 bl. (1 sp. 1 bl.) 5 times 2 sp.

Seventh Row—(1 sp. 1 bl.) 7 times 1 sp.

Eighth Row—Like sixth row.

Ninth Row—Like fifth row.

Tenth Row—Like fourth row.

Eleventh Row—Like third row.

Twelfth Row—Like second row.

Thirteenth Row—Like first row.

Fourteenth Row—8 sp. 1 bl. 8 sp.

Repeat from first row. There are two of the diamond motifs in underarm section. After thirteenth row of second motif is completed, chain 43, and repeat from first row of front, making six more large motifs for back, and two small ones for other underarm section. Join neatly. Fasten thread in at one corner of top of yoke front, and proceed as follows:

First Row—7 sp. 1 bl. 7 sp.

Second Row—6 sp. 1 bl. 1 sp. 1 bl. 6 sp.

Third Row—5 sp. 1 bl. (1 sp. 1 bl.) twice, 5 sp.

Seventh Row—(1 sp. 1 bl.) 7 times 1 sp.

Eighth Row—Like sixth row.

Ninth Row—Like fifth row.

Tenth Row—Like fourth row.

Eleventh Row—Like third row.

Twelfth Row—Like second row.

Thirteenth Row—Like first row.

Fourteenth Row—8 sp. 1 bl. 8 sp.

Repeat from first row. There are two of the diamond motifs in underarm section. After thirteenth row of second motif is completed, chain 43, and repeat from first row of front, making six more large motifs for back, and two small ones for other underarm section. Join neatly. Fasten thread in at one corner of top of yoke front, and proceed as follows:

First Row—7 sp. 1 bl. 7 sp.

Second Row—6 sp. 1 bl. 1 sp. 1 bl. 6 sp.

Third Row—5 sp. 1 bl. (1 sp. 1 bl.) twice, 5 sp.

Fourth Row—4 sp. 1 bl. (1 sp. 1 bl.) 3 times 4 sp.

Fifth Row—3 sp. 1 bl. (1 sp. 1 bl.) 4 times 3 sp.

Sixth Row—2 sp. 1 bl. (1 sp. 1 bl.) 5 times 2 sp.

Seventh Row—(1 sp. 1 bl.) 7 times 1 sp.

Eighth Row—Like sixth row.

Ninth Row—Like fifth row.

Tenth Row—Like fourth row.

Eleventh Row—Like third row.

Twelfth Row—Like second row.

Thirteenth Row—Like first row.

Fourteenth Row—8 sp. 1 bl. 8 sp.

Repeat from first row. There are two of the diamond motifs in underarm section. After thirteenth row of second motif is completed, chain 43, and repeat from first row of front, making six more large motifs for back, and two small ones for other underarm section. Join neatly. Fasten thread in at one corner of top of yoke front, and proceed as follows:

First Row—7 sp. 1 bl. 7 sp.

Second Row—6 sp. 1 bl. 1 sp. 1 bl. 6 sp.

Third Row—5 sp. 1 bl. (1 sp. 1 bl.) twice, 5 sp.

motifs for shoulder strap. Make second strap same way. Add any simple beading and scallops to neck and armholes.

Lace Matching "Nellie" Yoke

Chain 34.

First Row—5 sp. 1 bl. 5 sp.

Second Row—4 sp. 1 bl. 1 sp. 1 bl. 4 sp.

Third Row—3 sp. 1 bl. (1 sp. 1 bl.) twice 3 sp.

Fourth Row—2 sp. 1 bl. (1 sp. 1 bl.) 3 times 2 sp.

Fifth Row—(1 sp. 1 bl.) 5 times 1 sp.

The "Nellie" Yoke for Nightgown or Camisole

Sixth Row—Like fourth row.

Seventh Row—Like third row.

Eighth Row—Like second row.

Ninth Row—Like first row.

Repeat from second row to length wanted. Make scallops to match those of yoke, beading along one edge of lace.

Single crochet along upper edge of lace and lower edge of yoke to make edges stronger for sewing to garment.—

MABELLE ROBERT.

PHILIPSBORN'S DEPARTMENT-501-CHICAGO-

3 REMARKABLE BOOKS for Only \$1.98

Send No Money!

FICTION clean, thrilling, romantic, amusing. The newest books within the reach of every farm family.

THE SCOUT SAYS GOOD-BYE

The American Agriculturist has combed the book markets to get you these amazing bargains. They were published to sell at an average price of \$1.75 each.

3 X \$1.75 = \$5.25
WE SEND YOU
3 Books C.O.D. for \$1.98
(plus a few cents postage on delivery to you)

How's that for saving money? Make your choice from the list below—choose any three; order by number and *order now*.

For bargains like these are soon snapped up. You will notice that many numbers have already disappeared—stocks are low on others. Moral: The early bookworm gets the prize!

A Virginia Scout is a book for the whole family.

When Sonny comes home from school he is buried in it before he says "hello." When mother wants the chores done, she has to get it away from him and threaten to throw it in the fire.

Then she peeks inside; and some time later father stamps in and says "what about some dinner for a hungry man?"

And while mother's washing dishes, father gets it and when Sonny looks for it all over the place, father says severely "sit down and do your home work—that ought to keep you busy all evening."

In other words, **A Virginia Scout** is a book that has everything all the members of the family like—Indians, fighting, brave pioneers, a "different" heroine, and an ending with which no one could quarrel. Ambushes, capture, danger and escape—and the distant rumble of revolution—this story of early Virginia is an exciting romance and also authentic history.

(It is understood that if any of the books I check are sold out, you will substitute ones of the same type and equal value).

Here are the Books!

(Take your choice; 3 for \$1.98, extra copies, 75c)

- (3) **IN THE FAVOUR OF THE KING** Daniel Hawthorne
The lure of gold in old Mexico
- (5) **"WITH THE HELP OF GOD AND A FEW MARINES"** Brig. Gen. A. W. Catlin
History by one who was there
- (9) **THE LION'S MOUSE** C. N. & A. M. Williamson
Mystery, doubt and the test of love
- (12) **A VIRGINIA SCOUT** Hugh Pendexter
American in the making and the makers
- (13) **KINGS OF THE MISSOURI** Hugh Pendexter
The romance of the old fur traffic
- (16) **THE FIRST CHRISTMAS** Lew Wallace
The most beautiful part of Ben Hur
- (20) **BROKEN TO THE PLOW** Charles Caldwell Dobie
Tragedy which brings out a man's soul
- (21) **MY TRIP ABROAD** Charlie Chaplin
Custard pies in Europe
- (23) **ROLLING ACRES** Bessie R. Hoover
A sympathetic novel of rural life, with real people for its characters, humor, pathos and a love story at once entertaining and touching. The joys and sorrows of the Lybrook family, the difficulties of Viola who had "a superior fetching-up," and the outcome of her tangled romance all make delightful reading. An unusually fine book
- (24) **PIGGIE** Elinor Gates
A humorous tale of farm life seen through the eyes of a little pig who became a small boy's pet. Such adventures as Piggie has! But he finally cries "wee! wee! wee! all the way home"
- (25) **THE ADVENTUROUS LADY** J. C. Snaith
When a beautiful, imperious daughter of an impecunious Earl changes places with a frightened little governess who has had small chance for romance, things begin to happen. An amusing tale from start to finish
- (26) **THE COUNCIL OF SEVEN** J. C. Snaith
Too much power in the hands of the newspapers! An exciting story of how a brave young man challenged the head of the newspaper trust, won a girl from the enemy's stronghold and freed the country from a dangerous organization
- (27) **OLD FIGHTING DAYS** E. R. Punston
A corking story of adventure that brings back the best days of the prize ring in "Merrie England." A country boy wins name and fortune and, with the threat of Napoleon in the air, saves England in her moment of dire need
- (28) **TEAM PLAY** George C. Sweimore
Boarding school boys—full of strange tricks and devious ways, but laughable, and, in a pinch, dependable. The clan makes things fly in Sweetwater, and any live boy would want to be one of them
- (29) **A KING IN BABYLON** Burton E. Stevenson
Recent discoveries in Egypt add interest to this story of a motion picture company, which journeys to the mysterious country of the Nile and meets much more excitement than they bargained for
- (30) **THE BOY'S BOOK OF SUBMARINES** A. Frederick Collins
Mr. Collins knows his subjects and knows how to extract the thrill which boys love. In the first work he tells how a real submarine is made and works and how to make a workable model. The up-to-date romance of the oil fields is woven into an exciting story in the second. Both fully illustrated
- (31) **JACK EATON, OIL PROSPECTOR**

NOTE: These are all clothbound, high-class books from standard publishers. Almost all are illustrated, some in color.

No Paper or other cheap bindings. Never offered before in any cut rate or combination offer.

Planning For Christmas

Looking Ahead Saves Work and Worry Later

HAVE you made plans for Christmas yet? It's not too early to start. Even a busy farm woman can make many fancy things in her spare time.

I am already preparing fancy aprons and caps for Christmas purposes. Crocheted articles are always welcomed, and the girl who can crochet can earn quite a bit of pin money by making and selling articles for and at Christmas.

I begin to make my Christmas plans in June and by December the first, I have practically all my gifts prepared, except the candy. For years, I have made my own candy and besides being less expensive, we all of us prefer it to the "boughten" kind as the children say. A box of home candy is another always welcome gift, whether for man or maid, old or young.

A friend of mine started in after last Christmas saving up all her surplus pennies, nickels and dimes. These were put away each week. She cut out all pet extravagances, put away every nickel and dime that she had been in the habit of spending, and started out to save a little money toward a spring suit. On May the first, she had saved \$40. She purchased her suit and began to save up for Christmas money. The idea appealed to me so I am trying it.

My aprons and caps are made of plain gingham or percale and the pattern is always a fancy one; but yet not too fancy. Crocheted night-gown yokes, camisoles, caps, fancy aprons, books, handkerchiefs, powder, tooth-paste, gloves, powder puffs, stationery, silk stockings, cameras and jewelry are always sensible gifts for a woman.

For a man, I suggest gloves, ties, scarf-pins, handkerchiefs, stationery, fountain pens, books, carpet slippers, comb, cigarette or cigar holder and hose. Let me give you a little hint in regard to selecting a tie for a gentleman. Select if possible, one that is washable. They may not be quite as fancy, or as costly, but they will wear. —PAULINE CARMEN.

The Broad Highway

(Continued from page 306)

"What is?" I inquired.

"The resemblance between you and your famous cousin."

"It would appear so," said I, shrugging my shoulders, "though, personally, I was unaware of this fact up till now."

"Do I understand that you have never seen Sir Maurice Vibart, never seen 'Buck' Vibart?"

"Never!" said I.

"Too much occupied in keeping to the Narrow and Thorny, I suppose? Your cousin's is the Broad and Flowery, with a vengeance."

"So I understand," said I.

"Nevertheless, the resemblance between you, both in face and figure, is positively astounding! With the sole exception that he wears hair upon his face, and is of a ruddy complexion, while you are pale, and smooth-cheeked as—as a boy—"

"Or yourself!" said I.

"Ah—exactly!" he answered, and passed his fingers across his chin tentatively, and fell again to staring lazily up into the sky.

And herewith, lying upon his back, he told mad tales of a reckless Prince, of the placid Brummel, of the "Dashing" Vibart, the brilliant Sheridan, and many others, whose names are now a byword one way or the other. He recounted a story of wild prodigality, of midnight orgies, of days and nights over the cards, of wine, women, and horses. But, lastly and very reverently, he spoke of a woman, of her love, and faith, and deathless trust. "Of course," he ended, "I might have starved very comfortably, and much quicker, in London, but when my time comes, I prefer to do my dying beneath some green hedge, with the cool, clean wind upon my face. Besides— She loved the country."

"Then there are some women who can't be bought?" said I, looking at his glistening eyes.

"Mr. Vibart," said he, "so far as I know, there are two—the Lady Helen Dunstan and the 'Glorious' Sefton."

(To be continued)

A GOOD FRUIT CAKE RECIPE

2 pounds raisins; 2 pounds currants; 1 pound brown sugar; $\frac{3}{8}$ pound citron; 4 level teaspoons baking powder; $\frac{1}{4}$ pound butter; 3 eggs; $\frac{1}{2}$ cup molasses; 1 cup milk; 4 cups flour; $\frac{1}{2}$ nutmeg grated; $\frac{1}{2}$ teaspoon allspice. Cream butter, sugar and eggs, add molasses and milk and last two cups of flour. Mix fruit with one cup of flour, and add spices, and last add cup of flour well sifted with baking powder. Bake in slow oven.

FOR THE WOMAN WHO SEWS AT HOME

No. 1765 is a dress designed for the woman of ample proportions. It has long lines and a graceful touch of side drapery, yet is easy to make and economical of material. Patterns come in sizes 36, 38, 40, 42, 44, 46 and 48 inches bust measure. The 36 inch size will require $3\frac{3}{4}$ yards 42-inch material with $1\frac{1}{2}$ yards contrasting. Price 12c.

No. 1898 is the ideal pattern for a child's dress. It is perfectly simple, yet with pretty material and trimming looks adorable on a plump youngster. No. 1898 cuts in sizes 2, 4, 6, and 8 years; size 4 takes $1\frac{1}{2}$ yards 40-inch material with $\frac{3}{4}$ yard contrasting. Price 12c.

No. 1837 shows the fashionable tie-blouse in two materials. Worn with the plainest skirt, it adds a smart touch to the costume. No. 1837 cuts in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 takes $2\frac{3}{4}$ yards 40-inch material with $\frac{3}{4}$ yard contrasting. Price 12c.

To Order: Write name, address, pattern numbers and sizes very clearly; enclose proper remittance in stamps or coin (wrap coins carefully; stamps are safer) and mail to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York, N. Y.

What 10c Will Buy: A copy of our big Fall and Winter Fashion Book. More than a pattern catalogue, it is really a dictionary of style. You need one to consult for dozens of dressmaking purposes. It is only 10 cents a copy—add the amount to your order.

Apples In Tempting Form

Recipes That Bring the Plates Back For More

"I CAN safely say that I use five times as many apples as I used to."

It was at the close of a lecture at the State College Farmers' Week last winter and one woman was overheard speaking to her neighbor as they went out together.

"Well, our family can't quite equal that," said the other, "but I'm always looking for new recipes to use them. Let's compare notes and see if we can't exchange some ways of cooking them."

So they did and here are some of the results:

Glazed Apples

Pare and quarter tart apples. Arrange in shallow baking pan; sprinkle with 1 cup of sugar and ½ teaspoon of cinnamon; dot with small pieces of butter, bake until transparent. Serve with roast pork or as dessert with cream.

Dutch Apple Cake

2 cups of pastry flour; 4 teaspoonfuls of baking powder; 1 teaspoonful of salt; 2 tablespoons of sugar; 2 sour apples; 2 tablespoons butter or half lard; 1 egg; ½ cup of milk; 1 tablespoonful of sugar and 1 teaspoonful of cinnamon mixed.

Mix ingredients as for baking powder biscuits, mixing sugar with dry ingredients; egg beaten very light and mixed with milk, then with dry ingredients. Pour mixture into buttered shallow tins. Cut pared apples into small sections, press sharp edge into batter and sprinkle with mixed sugar and cinnamon. Bake in a hot oven 20 to 30 minutes. Serve as a breakfast bread or as a dessert with hot brown sugar sauce.

Apple Dumpling

2 cups of flour; 3½ teaspoonfuls of baking powder; ½ teaspoonful of salt; 3 tablespoonfuls of shortening; 2/3 of a cup of milk; 6 apples.

Mix dough as for biscuits, pat or roll into sheet ¼ inch thick. Cut dough into pieces large enough to cover apple. Pare and core apple, fill center with raisins, jelly, or sugar with lemon juice and spices; place apple in middle of dough and press edges together. Place on floured tin and bake in moderate oven until apples are tender. Serve hot with creamy sauce.

Brown Betty

1 cup light brown sugar; ½ teaspoonful of cinnamon; 2 tablespoonfuls of lemon juice; grated rind of lemon; ½ cup of butter; 1½ cups of bread crumbs from center of loaf; 4 cups of sliced apples; ¼ teaspoon of salt; ½ cup of water; 1 cup of seedless raisins.

Arrange crumbs and apples in layers in a buttered baking dish having crumbs on top layer. Sprinkle each layer with sugar, cinnamon, raisins and dot with butter; add lemon rind and water just before sprinkling on last layer. Bake in a slow oven 1 hour.

Apple Sauce Cake

1 cup of sugar; ½ cup of butter; 1½ cups of apple sauce; 2 teaspoonfuls of soda; 1 teaspoonful of cinnamon; 1 teaspoonful of nutmeg; ½ teaspoonful of cloves; 1 cup of seedless raisins; 2 cups of flour.

Cream butter and sugar, add apple sauce, then dry ingredients that have been mixed and sifted together; lastly raisins that have been floured. Bake 45 minutes in a moderate oven.

Apple Fritters

1 cup of flour; 2 tablespoonfuls sugar; ½ teaspoon salt; 2 eggs; ½ cup milk; 6 apples.

Mix and sift the dry ingredients; add beaten yolks and milk. Beat; cut and fold in the beaten whites of eggs. Core and pare apples, cut in round slices. Mix ¼ cup of sugar and 4 tablespoonfuls of lemon juice and let apples stand in this mixture for 1 hour. Dip in batter, fry in hot fat, drain on brown paper and serve with syrup.

Then of course, there's apple tapioca, which takes 4 apples to a half cup pearl tapioca and 4 cups boiling water, and the always popular baked apple, which some like with sugar and butter in the place where the core used to be, while others hold out for raisins and plenty

of them. Waldorf salad is delicious, for celery and walnuts seem to combine perfectly with diced apples. And who would leave out apple pie? (That's what's known as a rhetorical question, for the answer is "no one!") Perhaps the following filling may be a little different from the one you use:

Apple Pie

Pastry—1½ cups of flour; ¾ teaspoon salt; 6 tablespoons lard or lard substitute; cold water.

Have everything as cold as possible. Sift flour and salt together. Work in shortening. Add water a little at a time until moist enough to roll. Roll on floured board to right size.

Filling—4 or 5 tart apples; 1 cup sugar; ½ teaspoon cinnamon or nutmeg; 1 teaspoon butter; 1 tablespoon flour; few grains salt.

Line medium sized pie tin with pastry. Slice apples into same and sprinkle with sugar, cinnamon, flour and salt that have been mixed together. Dot with butter. Moisten edge of crust with water and cover with top crust, press edges together. Bake 35 to 40 minutes; in a hot oven 20 minutes and balance in a moderate oven.

THE QUILT GOES TRAVELING

The Mother Goose Quiltie is going to New Zealand! One of our readers, in ordering a second set of transfer patterns, wrote us:

"I want to tell you about the Mother Goose Quiltie. I think you should have a number of calls for the transfer patterns. I outlined mine in pale blue, put it together with a lovely baby-blue gingham, tufted with blue floss. I put sachet in the filling and it is really very sweet. I wish you could see it. There are a number of my relatives living in New Zealand and I think it will go there. I embroidered it on fine unbleached muslin. Oh, it's just dear! I thank you for being able to have purchased the pattern from you.—MRS. J. S., N. Y.

PRAISE FROM OUR FRIENDS

"I want to say that I think the pattern No. 1620 is the nicest thing of its kind. I sent for one some little time ago and have used several dresses made from it which have been much admired. I want this one to give a friend."—MRS. F. J. S., Pa.

(No. 1620 is the "two-in-one" dress, with detachable apron, really two patterns for the price of one. We can still supply it at twelve cents for the combination pattern.)

"Thank you ever so much for your great accommodation in furnishing me with a good program for Floral Day. If everything goes well, we shall have a most interesting evening."—MRS. J. S., N. Y.

Aspirin

Say "Bayer" and Insist!

Unless you see the name "Bayer" on package or on tablets you are not getting the genuine Bayer product prescribed by physicians over twenty-two years and proved safe by millions for

Colds	Headache
Toothache	Lumbago
Earache	Rheumatism
Neuralgia	Pain, Pain

Accept "Bayer Tablets of Aspirin" only. Each unbroken package contains proper directions. Handy boxes of twelve tablets cost few cents. Druggists also sell bottles of 24 and 100. Aspirin is the trade mark of Bayer Manufacture of Monoaceticacidester of Salicylic acid.

A Modern Bathroom, \$60

Just one of our wonderful bargains. Set comprises a 4, 4½ or 5 foot iron enameled roll rim bath tub, one 19 inch roll rim enameled flat-back lavatory, and a syphon action, wash-down water closet with porcelain tank and oak post hinge seat; all china index faucets, nickel-plated traps, and all nickel-plated heavy fittings. J. M. SEIDENBERG CO., Inc. 254 W. 34 St. Bet. 7th and 8th Aves. N. Y. C.

Reviewing the Latest Eastern Markets and Prices

WHAT RESTAURANT OWNERS SAY ABOUT EASTERN APPLES

HERSCHEL H. JONES

AN official invitation to the United Restaurant Owners' Association of New York City which includes a large number of chain restaurant organizations to participate in the eastern Apple Exposition and Fruit Show, recently brought forth a reply that may be of interest to you. We print it with the approval of the writer, C. W. Klein, as follows:

Our membership was not strongly represented at a meeting held to-day and so could not obtain desirable members to participate in this show, but it was the consensus of opinion of all those present to convey the message to the Apple Shippers that better facilities for shipment of graded apples ought to be inaugurated and these are the recommendations:

Boxes instead of barrels should be used. Graded apples should contain only that grade specified on the container.

The members were especially bitter in their complaints of the condition in which they receive these apples and we believe these conditions should be brought to the attention

of the proper authorities to correct them immediately.

We will appreciate your making an issue of this with the shippers to our mutual benefit.

Very truly yours,
CALVIN W. KLEIN,
Executive Secretary.

Here is something for our apple growers to think about, as this organization represents one of their largest market outlets in New York City.

One of the things that the restaurant owners will learn at the Eastern Apple Exposition and Fruit Show, however, will be that there are already in the Eastern States a considerable number of progressive, wide-awake apple growers who are packing apples in a way to meet the requirements of such buyers. Among them are those fellows over in Massachusetts who have made the slogan of their pack "APPLES THAT CAN BE EATEN IN THE DARK."

EASTERN APPLE MARKETS DULL

The market for barreled apples at New York, Boston, Philadelphia and other eastern cities continued dull last week, although the colder weather made the situation look a little more hopeful. The heaviest movement in New York State last week was probably of Baldwins which sold generally f.o.b. shipping point at between \$3.25 to 4 per barrel for A-Grade 2½ inch up. Some Hudson Valley Baldwins sold at \$4.25 per barrel.

The New York wholesale market quotations for October 25, on apples from nearby States are as follows: barrels, New York State A-Grade 2½ inch: ALEXANDER, \$3.50 to 4, BALDWIN, \$3.50 to 4; fancy, \$4.25 to 4.50, GREENINGS, best, \$5.50 to 6; fancy, \$6.25 to 6.50; ordinary, \$4.50 to 5, JONATHAN, best, \$4 to 4.50; fancy, \$5; ordinary, \$3 to 3.50; KINGS, \$3.50 to 4; fancy, \$4.25 to 4.50, FALL PIPPINS, \$5 to 6, MCINTOSH, best, \$7.50 to 8; fancy, \$8.50, NORTHERN SPYS, best, \$5.50 to 6; few \$6.25 to 6.50, PEWAUKEE \$2.50 to 3, SUTTON BEAUTY, \$3 to 3.50, SNOW, best, \$5 to 6, ROME BEAUTY, \$3 to 4, TWENTY OUNCE, \$3.50 to 4.25, WEALTHY, best, \$5 to 5.50; fancy, \$5.75 to 6, STAYMAN, \$3 to 4; WOLF RIVER, \$3.50 to 4; fancy, \$4.25 to 4.50, SPITZENBURG, \$4 to 4.50, STARK and WAGNER, \$3 to 3.50.

POTATO MARKET STEADY

The demand for potatoes in the New York City Market has been limited. With colder weather the consumption increases and the dealers then expect better prices, if the supplies are not unusually heavy.

Long Islands advanced last week due to the big storm that tied up potato movements. Sacks of 150 pounds jumped from \$3.20 f.o.b. loading point to \$3.50. Most of the stock is out of the fields and many believe prices will hold steady. "States" in bulk were offered

in carlots at \$1.65 to 1.75 cwt. delivered; in 150-pound sacks \$2.70 to 2.80 New York City. Growers overpaid from 60c to 70c bushel.

CABBAGE MARKET DULL

Danish cabbage carlots were sold at \$17 f.o.b. loading point last week; some at \$16. Kraut, large stock at \$11; a few buyers paid \$12.

GOOD DEMAND FOR POULTRY

Generally there was a good demand for live poultry last week. Colored fowls sold as high as 30 cents and chickens 25 cents per pound on express shipments.

GLOOMY PROSPECT FOR TURKEYS

The recent report of the Federal Bureau shows holdings of 6,337,000 pounds. This is over twice as large as last year and three times greater than the five-year average.

The nominal prices for turkeys on the New York Market now are 50 cents per pound but there are scarcely any arrivals.

MIXED EGGS HARD TO SELL

Fancy nearby eggs continued to meet a sharp demand and prices advanced slightly. Dealers and commission men holding mixed eggs which are in large supply had difficulty in disposing of them at 28 to 33c per dozen, most of the distributors turning to storage eggs for immediate use.

BUTTER MARKET STEADY

The butter market held steady during the past week. Extras on October 26 were selling readily at 48 cents per pound. There were sharp reductions in the storage holdings of butter and only a moderate reported decrease in the make of butter. On the whole the national butter market appears on a sound satisfactory basis.

CHEESE MARKET UNSETTLED

The New York market continued in a very unsettled condition. Offerings of 24½ cents for New York State average run flats brought no bids on October 25.

HAY MARKET WEAKER

The hay market in New York City during the week slightly weakened, but better weather and light stocks indicated a better market at the close.

Color Your Butter

"Dandelion Butter Color" Gives that Golden June Shade and Costs Really Nothing

Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade to bring you top prices. "Dandelion Butter Color" costs nothing because each ounce used adds ounce of weight to butter. Large bottles cost only 35 cents at drug or grocery stores. Purely vegetable, harmless, meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Tasteless.

Wells & Richardson Co., Burlington, Vt.

Marketing Fruit Is a Grower's Problem

(Continued from page 303)

ing and branding of so many varieties of fruit in the local associations, the inspection, supervision, and selling of these through a central association and a national sales agency, involves not only a high type of efficient business organization and management, but considerable inevitable delay in making returns. Since all the fruit that is to go into a pool must be sold, and since all the charges including allowances, losses, storage costs, etc. must be secured and deducted before a pool can be closed, it is obvious that no one can be paid until all these items are brought together. On the other hand, many growers have to have money to pay for packing, packages, and in some cases spray material as soon as the fruit is ready to market. This involves borrowing both by the locals and by the central, often without collateral security. These borrowings run into thousands of dollars. Further demands have to be met before many of the pools can finally be closed. These further borrowings are usually on warehouse receipts. The ability to finance all these operations adequately and securely and to pay obligations promptly and fully is of fundamental importance in the whole cooperative marketing problem.

Assured Volume of Business and Contracts Essential

No one who has studied the problem of marketing any commodity can fail to appreciate the vital importance of volume of business. Without volume, overhead costs are likely to become prohibitive. Without long term contract, volume, reputation for grades and brands cannot be obtained in the markets, steady shipments maintained, and an assured business built up. Volume is of the utmost importance in reducing percentage of overhead costs and in influencing the market price. Without adequate volume in the markets, even the highest quality of goods are unable to obtain the necessary premium in the face of heavy shipments or consignments of similar fruits, even though they be of inferior quality. This common practice of consigning to markets and taking a speculative chance on obtaining a fair price is the primary cause of alternate famines and gluts in the markets. This of course affects the association's business in a very vital way.

Some way must be found to make the majority of growers see that their interests are all bound up together in the solution of these problems and that members must trust their association (themselves) with their assured business over a series of years. The association directors and management have a great deal to learn before they will become efficient marketing agents. They must not only know all that the skillful and experienced dealers, speculators and jobbers know, but they must become better informed and more skillful in order to deal successfully with these newer and larger aspects of marketing problems. This means specialization; it means mutual confidence. But in the end it will also mean a measure of control in the markets and a reasonably assured fair profit to the growers for their products.

Every Grower's Job

The solution of the problems involved in the successful marketing of fruit is the grower's job just as much as the successful growing of the fruit is a grower's job. Neither are these marketing problems the special responsibility of any selected number of growers any more than of every other group of growers. Successful cooperative marketing depends absolutely upon a majority of the growers pooling their interests together for volume and a measure of necessary control, and upon mutual confidence in one another and especially in the ability of their leaders and officers to work out the problems. It is a common interest and a common job. The problems are not insuperable; in fact, given this volume of business and confidence, any reasonably competent board of directors ought to be able to build up efficient marketing machinery. This is the job that lies before the fruit growers of New York State.

LET US TAN YOUR HIDE.

Horse or Cow hide, Calf or otherskins with hair or fur on, and make them into coats (for men and women), robes, rugs or gloves when so ordered; or we can make your hides into Oak Tanned Harness or Slaughter Sole or Belt Leather; your calfskins into Shoe Leather. Colors, Gun Metal, Mahogany, Russet or lighter shade. Calfskins tanned in the lighter shades of shoe leather, also make elegant stand and table covers; great for birthday, wedding and holiday gifts.

LET US FIX YOUR WORN FURS

freshen, repair and reshape them if needed. Furs are very light weight, therefore it would cost but little to send them in to us by Parcel Post and get our estimate of cost; then we will hold them aside awaiting your decision. If you say "go ahead," very well; we will do so and hold them free of storage until you want them. If you say "no," we will return them post-paid.

Our illustrated catalog and style book combined gives a lot of useful information. It tells how to take off and care for hides. About our safe dyeing process on cow and horse hides, calf and fur skins. About dressing fine fur skins and making them into neckpieces, muffs and garments. About taxidermy and head mounting.

The Crosby Frisian Fur Company,
571 Lyell Ave., Rochester, N. Y.

My Engine Will Do the Work of 6

Try This Remarkable Engine FREE

There is no other farm engine like it. Simple in construction and easy to operate. It is only one engine, yet it takes the place of six engines. It will give from 1 1/2 to 6 H. P., yet it is so light that two men can carry it easily. Set it anywhere and put it to work.

Change Power as Needed

It is a 6 H. P. when you need 6, or 1 1/2 H. P. when you need only 1 1/2, or any power in between. Fuel consumption in proportion to power used and remarkably low at all times. Adjustment from one power to another is instantaneous.

Burns Kerosene

Operates with kerosene or gasoline. Easy starting, no cranking. The greatest gas engine

value on the market. And you can prove all of these statements to your own satisfaction.

What Users Say

Ivan L. Blake, of Hamibal, New York, says: "Only engine economical for all jobs. I run a 28-inch cord wood saw, a 24-inch rip saw, a washer, a pump, and a grinder, and it sure runs them fine. It has perfect run-in balance, and it sets quiet anywhere."

Clarence Rutledge, of Manitoulin Island, Ontario, says: "Have given my Edwards four years' steady work and like it fine. It uses very little fuel. I run a 28-inch cord wood saw, also a rip saw, 8-inch g. ider, ensilage cutter, line shaft for shop, churn, washer, separator and pump. Have had ten other engines and the Edwards beats them all."

Frank Foell, of Cologne, New Jersey, says: "It's a great pleasure to own an Edwards engine. I run a wood saw, cement mixer,

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."
—A. Y. EDWARDS

Order

There are big days, and happy days when your family and your friends sit down to your fine big dinners. Picture your pleasure in having for such occasions a Dinner Set like this; pure, gleaming, flawless white, edged with a smooth, bright, shining gold line, gold handles, and a dainty lower band of colorful orange. Then think of the added satisfaction of this distinctive feature: **Your Own Initial on Each and Every Piece.** Each initial set in an artistic wreath which is backed by a charming scroll of roses in beautiful colors. This illustration does not begin to do it justice.

**Martha Washington
Colonial Shape Initial Dinner Set**

110
Pieces

No picture, no description can do justice to this exceedingly beautiful dinner set. I want you to see it on your own table. I want you to know the Attractiveness of its Aristocratic Martha Washington Colonial Shape, the Beauty of its Gold Border. I want you to see with your own eyes how the big, wide, gorgeously brilliant gold handles enliven, enrich and beautify the set. Then I want you to know the Pride of Possessing a big, fine, high-class dinner set that has your initial on each and every piece. So, I will gladly send you the entire set, 110 Pieces, on 30 days' Free Trial.

The picture above shows, in reduced size, the attractive initial design. This design is in 7 harmoniously blended colors and gold.

SUPREME QUALITY. Only the very best materials are used in the manufacture of these dishes. Extreme care is taken in all of the different operations. Everything that high class materials, manufacturing skill, art and design can do, has been done to make this beautiful Dinnerware a Remarkable Bargain. All of the decorations; the initial, the wreath, the scroll of roses in natural colors, the gold edge, and the inner line of orange, are absolutely put on to stay. We guarantee against breakage in shipment. Each piece is wrapped separately in tissue paper.

What Is Wrong With the Cooperatives? — By E. R. Eastman

Dollar Makers

Send In Some More—A Dollar Will Be Paid For Acceptable Short Letters

TWO years ago we began shipping our eggs to New York, first to a commission house, but the last year to a retailer. At first we did not make much as we had to learn a lot, but now our eggs are graded as near-by hennerly whites. During August, we made after deducting all expenses \$69.30 more than if we had sold them at home, which we think are dollars easy made, after having done the work of producing them, just putting them on the market at the right place.

Now if I don't get one of your extra dollars, if this will help some other farmer to make some extra dollars, I feel well repaid.

We have a farm of sixty acres, keep seven cows. My wife and I do all the work so we don't spend all our time with the chickens.—C. R. B., Pa.

* * *

TURN AND MATCH UP

Work gloves and children's mittens "rights" worn out? Plenty of lefts? Turn half the lefts and match up.

Starch with thin starch garments that are to be badly soiled, or just dip in the collars and wristbands and they will wash easier and wear longer. Try it with the children's play clothes even if you do not intend to iron them.

When work-shirt collars and french cuffs on sport shirts begin to show wear rip off and stitch on reversed. This only takes a few minutes and adds a third to the respectable wearing life of the shirt.—MRS. S. H. P., Massachusetts.

* * *

NEW COAT FROM AN OLD ONE

I am so well pleased at the success I just recently had at saving not only one dollar but several that I simply must try to pass it on to other mothers.

Two year old daughter had to have a new coat for winter, a neighbor who has a grown daughter offered me the coat of a cast-off blue serge suit. This was ripped apart, cleaned and pressed, both outside material and satin lining. Then with the aid of a good pattern and by much careful planning, little daughter's coat was cut from the old, with the only piecing being at the waistline where a belt would hide it. Fifty cents' worth of outing flannel made the inner lining, giving more warmth, and the finished article is one both mother and daughter can feel proud of.—MRS. H. J. L., New York.

* * *

TEN LITTLE PIGS—AND THEN THERE WERE NINE

Our old pig died twenty-four hours after giving birth to ten little pigs, and I undertook the task of bringing them up. I brought them in the house to keep warm, I then diluted Jersey cows' milk and sweetened with a little sugar and fed them just five drops every two hours the first day, then gradually increased the amount until they were drinking out of a saucer by holding my finger in the milk to teach them to drink.

Every one told me I could not bring up little pigs on sweet milk, but they grew plump

and gained flesh wonderfully fast. I only lost one by getting chilled. This was a night as well as a day job for little pigs as well as little babies need food through the night and they were always ready for their regular feeding.—J. B. D., New York.

* * *

MONEY IN HOME GARDENING

I consider the one-half acre annually cultivated in gardening makes, and also saves, more money for me than any other sideline scheme I ever tried. It furnishes at least one-half the living, and decidedly the best half, too, and pays best part of the grocery and family wash bills. Again, good fresh

extra penny for so many needed things around a home.

Your opportunity to help us to earn another dollar is most welcome. My sister who teaches, gives me a dollar each week for doing her laundry and the necessary mending. I also can do outside sewing on plain things for which I get a dollar a day and it is a great help and so many of our neighbors all over are glad to get a little help which they find easy to pay for and we glad to earn.

A great many people might find girls who are away from home who would be only too glad to get their laundry and mending done where there is no danger of eyes and half the care used in fine things.—MRS. R. L. C., New York.

* * *

HOME-MIXED DAIRY RATIONS

I save at least \$2 to \$4 on every ton of feed by home-mixing my ration for the dairy, instead of buying ready-mixed feed. I follow Professor Savage's formula for different seasons. At present I mix 100 pounds each of Bran, Hominy, Grain, Oats, Gluten and Oil Meal. I vary ration as he suggests.—W. D. A., New York

* * *

SELLS HOMEMADE COTTAGE CHEESE

I take my sour milk and make it up into cottage cheese and sell it to my neighbors. I make it into balls and often have more than a dollar easy, I say. It also gives me a chance to call on neighbors, which I might not do otherwise.—MRS. C. W. C., New York.

* * *

BOILS CULL POTATOES FOR HOGS

The potatoes that are too small for seed or to sell, I boil and mix them for the pigs with hominy and it certainly fattens them and then it does not take so much feed to get them ready for killing.—MRS. C. S., New York.

* * *

A DOLLAR SAVED IS A DOLLAR MADE

I have saved many dollars by making all my dish towels from sugar and flour sacks, by using grain bags for kitchen towels, making mittens and holders from stocking legs, and by fashioning warm house slippers from old heavy coats with soles cut from discarded felt hats.

This year I have raised my own sage in the garden, and when I get an extra supply, I will sell that to earn an extra dollar.—MRS. F. C., New York.

* * *

SKIN MONEY

I trap and catch muskrats and skunks.—H. S., New York.

* * *

HATCHES AND SELLS BABY CHICKS

Last spring I hatched, with incubators, baby chicks for sale, some from my own eggs and some from eggs the customers brought. I very much prefer to hatch my eggs from my own flock as they hatch better, for any old egg will not hatch in an incubator.—MRS. E. H. B., New York.

The Wrong Idea of "Dollar Making"

vegetables are healthy, which means less doctor bills to pay.

A few years ago we sold over \$100 worth of vegetables from this half acre, had an ample supply to use all along for table use from early spring to early winter, and besides, had plenty to can for winter use.—W. H. H., Virginia.

* * *

COUNTY FAIR PRIZE MONEY

There are many ways that a farmer can make extra money during the year if he will plan to do so. I have a small farm and I always try to have something worth while to show at the County Fair. The premiums that I get bring me considerable extra revenue for the season's work. Sometimes I plan to show the different kinds of grains and vegetables that I raise on the farm. I make it a point to exhibit farm produce at six or more County Fairs in the State. During the past two months, we earned \$121 in this way at six County Fairs. This is not a large sum but it helps out when taxes come due.—A. C. VAN L., New York.

What Is Wrong With the Cooperatives?

Those That Fail to Profit By Experience Will Be Weeded Out

By E. R. EASTMAN

FOR many years after this country was settled the farmers had no real marketing problems. Every farm was a complete production plant where nearly everything that the family needed to eat and wear was grown, and every kitchen was a laboratory where food products were prepared and preserved, and rude clothes were manufactured. Each man's farm was his kingdom where it was pretty nearly true that the farmer was "monarch of all he surveyed," and where he was more nearly independent than he has ever been since or ever will be again.

But times changed, as they have a habit of doing, especially in progressive America. As the changing times began to bring more population and new problems, the farmer began to lose some of his independence and to depend more and more upon agencies outside of his farm. A marketing problem therefore developed. It was necessary to buy more and more supplies for the farm and in order to get the money to buy them, the farmer found that he had to sell more surplus products. Because his sold products were surplus, more or less unimportant at first, he paid little attention to selling them properly, and when he did wake up at last to the fact that he was getting the bad end of the deal, both going and coming, in the markets, he found it too late to do anything with the situation as an individual. The middle men had the market business pretty well sewed up and moreover, they intended to keep it so.

As the cities began to grow, and to bring their food from longer distances, the problem constantly became more complicated and the farmer found it increasingly difficult to get anything like fair prices for what he had to sell. For two generations or longer the farmers bitterly complained about market conditions when they met each other on the road or at the milk stations, but their dissatisfaction was usually limited to merely finding fault. Sometimes individual farmers became indignant and tried to take some action, or small groups got together, but without success. A few larger groups of farmers who tried to buck the dealers, always failed because they could not stick together.

Finally, about the beginning of the World War, conditions became so intolerable on the farms that there was a general uprising of farmers from one end of the country to the other. Absolute necessity forced them to organize and they proceeded to do so in nearly every farm community and with nearly every farm product in America. The past ten years will go down in American history as the age of the great agrarian uprising, which may well be called the Cooperative Era.

Cooperative associations have been organized by the hundreds. There are at least twenty large milk sales cooperatives in the country, and in New York State alone there are twelve large farmers' organizations for buying or selling farm supplies or products, besides something like 1,224 small ones organized in the counties and communities. Without the least doubt, cooperative organizing has been overdone. Much that has been done was not well done. Any movement, however good, always goes too far. Cooperation has been preached as a fetish, almost as a religion. It has been advocated as a

very slow to organize. Perhaps the advantages of organization had to be over-emphasized. Anyway, the organizers were successful, or partially so, for the farmers joined up by thousands, and the cooperatives began to perfect their machinery, to set up their offices, and to get busy.

For a time, practically all of them succeeded, or appeared to do so. Most of them were organized during the war; prices were on the up-grade, and the newly organized cooperatives got the credit for all the increase. They were certainly entitled to some of it. Had it not been for organization, the dealer and not the farmer would have received most of the benefit of the increased prices.

During the first years of cooperation, there was much loyalty and enthusiasm. Many of the milk organizations pulled off successful strikes. This increased the enthusiasm and support, and the dealers who "had first come to sneer at cooperation remained to pray."

But finally the good times came to an end. The European war markets ceased, and the farmer, who had been the last to realize any benefits from those prices, was the first and the worst to get caught when they went down. He began to look around for something to kick and the first thing he found was his cooperative organization. And kick it he did! He could not understand why, when he had been told so much about the wonderful efficiency of his organization, that it could not

save him from declining prices.

The cooperatives began to realize that a friend in need is a friend indeed. They found that the enthusiasm of many of their member supporters depended upon the organization getting good prices. Many members, finding that cooperation was not the panacea for all of their troubles, dropped out; others constantly threatened to. Having been told by the organizers of the great profits between the producers and the consumers, the members constantly asked and are still asking why their organization did not bring those profits back to the producers.

The cooperative management on their part found, too, that many of the ideals and objects upon which the cooperative movement had been organized were all wrong. They found that there was a really tremendous service which had to be performed in taking the products from the farms and putting them into the consumers' hands; they found that this service cost money, and they found, too, that the only hope or excuse for the existence of their organization was in being able to render this service cheaper and better than the distributors already on the job. But this was not a glowing fact upon which to build the farmers' enthusiasm for cooperation. It was just a plain, cold matter of

(Continued on page 321)

Coming

WHAT salaries should cooperative associations pay their officers? What kind of officers and directors should be elected to run the cooperatives? Why does a nonmember get more money for his product in many cases than a member? Are the overhead expenses of a cooperative too high? Is there politics in the management of the cooperatives; if so, how much damage does it do? Should the farmers' organizations be managed largely through central control or local control? What about the contracts with members, should they have teeth in them and should they be for a long or short period? What is the future of the cooperative movement?

These and other intensively interesting topics will be frankly discussed in coming numbers of American Agriculturist. Watch for them, for you will be sorry if you miss them. The first one is on this page.—The Editors.

cure-all for all marketing evils; many of its advocates and supporters take the attitude that nothing can be wrong if done under the name of "cooperation"; they insist that the cooperative associations are perfect. Its enemies, on the other hand, go to the other extreme and will not admit the good points and the successes. There have been organizations for organization sake; there have been organizations to give the organizers jobs; mistakes have been made and hushed up; and successes have been over-emphasized.

In order to get men to join, promises have been eloquently made that have never had a chance to be realized. The great difference between the farmers' prices and the consumers' prices have been pointed out by the organizers, and the farmers told that cooperation and cooperation alone would wipe out all the difference, and all he had to do to bring about immediate success to his business was to sign on the dotted line.

Perhaps there was no other way to get the farmer to join, for he is not naturally a "joiner." He and his ancestors had lived too long on the lonesome pioneer farms and worked out too many problems alone to realize that the marketing problem was one that could not be solved alone. So he was slow to understand that nearly every other group was working together, and he was

Information on the School Bill

AT a recent meeting of the New York Conference Board of Farm Organizations, a suggestion was made that a special Publicity Committee ought to be appointed to see that the farm people of New York have every opportunity of getting full information about the Rural School Bill. In accordance with this suggestion, such a committee was appointed, consisting of one representative from each of the State farm and home organizations, making a committee of five members, no one of whom is a member of the Committee of Twenty-one.

Mrs. Mabel Feint, Dryden, N. Y., was appointed for the Federation of Home Bureaus; Mr. Enos Lee, Yorktown, N. Y., for the Farm Bureau Federation; Mr. S. L. Strivings, Castile, N. Y., for the New York State Grange; Mr. T. E. Cross, Lagrangeville, N. Y., for the State Horticultural Society; and Mr. D. J. Carter, Editor of Dairyman's League News, 120 West 42nd Street, New York City, for the Dairyman's League Cooperative Association.

This committee is now ready for work. Requests for speakers to explain the School Bill may be referred to any member of the committee whose name and address is given above, or to your own organization. Any request for printed material on the school bill may be made to any member of the Publicity Committee.

One Way to Help Wheat

THE situation in Germany daily grows more intolerable. Their money is a joke, worth less than the paper it is printed on. Their government is disintegrating and thousands of their people are actually starving.

If the suffering in Germany could be limited to those who first plunged the people into war and to those who have badly mismanaged it ever since the war, no one would worry. But unfortunately the just suffer with the unjust, the innocent with the guilty. It is hard for poor people to become poorer, and for innocent women to watch their chil-

dren sicken and die. No wonder that the papers are constantly filled with accounts of food riots, uprising and general chaos in Central Europe.

In December, 1921, Congress appropriated twenty million dollars for the American Relief Association, with which to buy corn for starving Russia. This purchase had two effects. First, it was a humanitarian one in that it helped to save thousands of Russian children from starving; second, it was good business for America because the purchase of the twenty million dollars' worth of corn relieved the pressure of the surplus corn and was one of the causes for the nearly fifty per cent advance in price of corn which followed in a few months.

Why could we not do the same thing with wheat? All realize that America has too much wheat, which results in the farmers getting a too low price for it. If the government were to purchase say fifty million dollars' worth of wheat and send it to Germany, it would go far toward relieving famine conditions in that country and would without doubt do much to help the wheat farmers here.

How Many Can You Do?

A VERY interesting and valuable little pamphlet, which should be read by every boy thinking of being a farmer, has just been published by the New York State College of Agriculture and the State Department of Education. It is entitled, "Prepare for Farming" and copies may be had by writing either of the above institutions.

It discusses briefly the farm operations and the different ways of getting an education in order to be a farmer. We were particularly interested in reading this little pamphlet to note the long list of skilled operations, the most of which every successful farmer must know how to perform. Farmers have grown up in the business so that few realize the immense amount of skill that it takes to run or manage an average farm. This is especially the case in this mechanical age, when most of the work is done with machinery.

Sometimes we take some little pride in our farm trade when we see a city man or boy try to harness a team of horses, or milk a cow, or pitch hay, or do any one of the dozens of other skilled tasks which a farmer must do. In this little pamphlet there is a partial list of some skilled farm operations. The list is by no means complete, but it brought home to us, as we are sure it will to you, the large amount of skill and training that it takes to make a successful modern farmer.

How many of the following operations can you do well: Sharpen an axe, cut logs, remove a calf's horns, pitch hay, lay tile drain, milk cows, treat cows for lice, sharpen a mower sickle, run a mowing machine, oil and repair a harness, sharpen a saw, shingle a barn, butcher a hog, shear sheep, weld a piece of iron, paint a building, operate a sprayer, pick out a good cow, mix and lay concrete, cull out poor layers, tell the age of a horse, strike out lands and plough, operate a tractor, run an automobile, break a colt, run a grain binder, shoe a horse, splice a rope, ride horseback, fit and connect water pipes, make a good haystack, stack grain bundles, shock grain, husk corn, operate an incubator, mix fertilizers.

Best Producing Guernseys

THE American Guernsey Cattle Club announced at the Dairy Show at Syracuse, that H. E. Babcock of Ithaca, has the best producing herd of Guernsey cows in the world. We are especially proud of this fact because Mr. Babcock is a staff member of the American Agriculturist and as our read-

ers know regularly contributes to our columns on dairy subjects. The best thing about Mr. Babcock's herd is that it has been developed without any frills or fancies. The cows are kept in an ordinary dairy barn, not any better than thousands scattered about the dairy country of the East. In fact, the last time we saw it, the stables were badly in need of a good coat of whitewash. No fancy prices were ever paid for any of the individuals, prices that are not beyond the pocketbooks of any average dairyman. A great deal of skill has gone into the selection and breeding, not for show or fancy purposes, but just to get milk and butterfat. The result is that other herds may have more fancy types, and better exhibition animals, but there is none in the world that equals this one in production.

We think that one trouble with the pure-bred dairy cattle business is that in the past it has contained too much speculative value. After all, the only real value of a cow is her ability to produce milk and offspring, which can also produce milk in large quantities. Mr. Babcock has demonstrated some of the possibilities to almost any dairyman with either pure bred or grades of developing good producers by using just plain horse-sense in breeding, feeding and care of the dairy cow.

Because Mr. Babcock knows and is proving from actual experience what he is talking about, we are glad to have him write for us regularly and to have you send in any questions on dairy subjects for his attention.

Eastman's Chestnuts

IN spite of all that I can do to chase them out, cows have an unruly habit of breaking constantly into this column. I can't seem to get this argument about breeds of dairy cattle settled. The fact is, after we are all dead and gone I suspect that our great, great grandchildren will still be quarrelling over who has the best breed.

You remember that I told the story here a while ago about Mr. Morgenthau's visit to Mr. Ed Babcock's farm at Ithaca and as he was looking over the fine Guernseys, he found stored away in a dark corner one lonesome Holstein. When Mr. Morgenthau took Ed to task about keeping a Holstein cow, you will recall that Ed confessed that he had to have the Holstein milk to raise his Guernsey calves! At least, that's what Mr. Morgenthau told me when he returned.

A little later, Lew Toan, who is president of the State Guernsey Breeders' Club, claimed that Mr. Babcock did not say any such thing, but what Ed really did say was that his well had gone dry, his spring had gone dry and he had to have something to wash his milk cans with!

Now along comes Ed again with still another version. Just between ourselves—and I wouldn't want you to whisper it out loud—I am beginning to suspect after sitting up several nights in an effort to determine who was telling the truth, that all three of these otherwise perfectly reputable gentlemen are fairly good candidates for the "Ananias Club" when it comes to discussing the merits of dairy cattle breeds. But here is Ed's story of why he keeps one Holstein cow in a large herd of Guernseys. Read it and judge for yourself.

Ed writes that neither the story of Mr. Morgenthau or Mr. Toan bears any resemblance to the truth whatsoever. The real reason, he says, is that he finds it difficult in the morning—particularly on foggy mornings—to locate the yellow and white Guernsey cows amid the buttercups and daisies. The black and white of the Holstein, however, show up prominently and he conservatively figures that by having her in the herd he saves at least fifteen minutes each day in getting the cows! Who's next?

Farm Bureau—What It Is, What It Does

Its Purpose Is Not Increased Production, But Better at Less Cost—A Radio Talk

THE other day a farmer who had recently moved on a farm in one of our New York State counties, asked me if there was any place in the county where he could go for reliable information which

varies from two to five dollars per year. In the majority of the counties it is five dollars.

By JAY CORYELL

New York State County Agent Leader

Every year sees more attention paid to farm seed

would help him solve some of his farm problems. Just what have you in mind, I asked? He replied: "There are a lot of things. I want to work out a system of farming which will best meet the present economic conditions which are unfavorable as far as agriculture is concerned. It means pretty close figuring as we have to look twice before we spend a cent. I am thinking of using lime. Will it pay? What variety of corn will be best for my section? How about fertilizer—how much per acre and what kind? Also I would like to get the best ration to feed my cows so as to supplement the feed I now have on hand."

"Did you ever hear of the county agricultural agent?" I inquired. "Yes," he replied, "I have heard there is such a man in the county, but I don't know much about him. He works in connection with the Farm Bureau, doesn't he?"

"Yes," I answered, "Let me tell you something about the agent and the Farm Bureau and how you can use them."

"The United States Department of Agriculture at Washington, and the State College of Agriculture at Ithaca, go into partnership with the farmers of a county for the purpose of carrying out an educational program of agricultural improvement. The farmer's partner is an organization known as the County Farm Bureau Association, and is a membership organization open to all persons interested in agriculture. The Board of Directors of the farm bureau, representing the farmers, together with the county agent leader, representing the public agricultural institutions, employ the county agricultural agent who makes his headquarters at a convenient point in the county, usually the county seat. The county agent must be a man who is thoroughly familiar with real farming, but besides this he must know the scientific side, having studied four years at a college of agriculture. This plan establishes a definite agricultural headquarters in the county where farmers and others may go for information. The work is supported through appropriations from the Federal, State, and County governments and through membership fees. The farm bureau membership fee in New York State

of the important features of the plan. Through the partnership plan of operation,

"The work is established in practically the whole State. The farmers in each of the fifty-five agricultural counties have an agent to serve them. In addition there are eight assistants. These men are supplemented in their work by extension specialists from the college of agriculture, who attend meetings of farmers to give them the latest information on particular agricultural subjects, and they also work with committees in the counties assisting them to formulate plans of work."

"Each county has a definite program of work which is made by farmers themselves. This program of work is one

A community pruning demonstration, showing a peach tree before and after pruning

opportunity is given to combine so-called science and practice. In this way the programs are such that they meet the real needs of farmers because farmers make them and have available the assistance of trained men.

"In order that the work may be effective, each community has what is known as a community committee. This committee is made up of several good farmers in each community. Each one of the committeemen carries out a particular line of work and is sometimes known as a project leader, one man taking charge of poultry work, another dairying, another the fruit and so on.

"When a community program is made the committeemen meet usually at the home of the chairman or at the community center. They first make a study of the farming of the community listing the chief sources of income, then deciding what are some of the limiting factors. The next step is to study how to solve the problems of this particular community. Carrying the program through to completion is the most important of all. It is very evident that the county agent cannot do this alone, but must have the support and cooperation of all of the committeemen. Each committeeman acts as a leader in the work in which he is particularly interested and sees that the program is actually carried out in the community."

"Through these programs of work the agricultural practices of many communities have been entirely changed. For example, in certain sections many farmers are growing improved varieties of oats, corn and other grains because of these programs. The first step was to hold demonstrations where the particular variety might be compared with those ordinarily grown. Farmers were invited to see the results. The use of these improved varieties soon becomes general, because the farmer buys them from a neighbor or other reliable source. In much the same way demonstrations showing the value of the use of lime are established. Farmers have a chance to see the results on their own farm. In this way the use of lime is established in the communities."

"Recently a house to house survey was made in Chenango County to see whether farmers were making any use of the agricultural extension work and how it could be improved. Hardly a farm could be found where some of the practices taught by the county agent and farm bureau had not been made use of. In many instances farmers were using lime and had planted improved varieties of corn as a result of watching their neighbors, but they did not realize that their neighbors had learned through meetings and demonstrations held by the farm bureau."

"The services of the county agent are available to all of the people in a county whenever there are agricultural problems on which a person needs assistance. Anyone is free to write, telephone or call upon the agent at his office. If you want the agent to go over some definite problem on your farm you can get this service for the asking. A postcard, letter or a word to your community committeeman

Do soy beans pay? Checking up on a demonstration plot

Uncle Sam Helps Farmers Get Credit

How to Use the Various Federal Land and Intermediate Banks

By J. VAN WAGENEN, JR.

THE usually whimsical and always delightful "George Duff" has recently remarked the fact that Congress and Government in general is doing every thing possible to make it easy for the farmer to run in debt. In certain ways the statement is literally true. Ever since the war and the problem of a world food supply focused attention on the farmer, everybody including Government and Big Business has been sincerely anxious to "do something" for the man on the land. The well-meant anxiety for his welfare seems to have declared itself especially in the

J. VAN WAGENEN, JR.

form of legislation looking toward easier credits. Industrial life has always believed that the ability to borrow easily at low rates of interest has been one of the great aids and incentives to business activity and good times and having heard that the farmer very frequently suffered from lack of sufficient capital and regular banking facilities, they have naturally desired in his behalf to correct these conditions. So to-day we have the twelve great Federal Land Banks, the seventy or more Joint Stock Land Banks and just this year the new Federal Intermediate Credit Banks. It does look as if the Government was giving us every opportunity to run in debt. I have no word of criticism of any of these institutions. I believe that in many cases they have supplied a real need and the fact that at the close of business on Feb. 28, 1923, the Federal Land Banks and the Joint Stock Land Bank taken together had outstanding loans of more than 918 millions of dollars, shows that the farmer to a surprising extent has availed himself of these facilities.

At the same time I have the conviction that after all the greatest need of the farmer is not easier credits and better banking facilities, but rather a reorganization of our selling system that will enable the farmer to retain for himself a larger share of the consumer's dollar. It is, however, very much easier to provide the banking system because that is a sort of fiat legislation that may be imposed upon the farmer from above, while a cooperative buying and selling organization must be a matter of education, growth and individual loyalty.

Some weeks ago I tried to set forth something of the plan and procedure of borrowing from the Federal Land Banks. The same Act which provided for the organization of these semi-public institutions under Governmental supervision and patronage, also provided for the organization of privately owned institutions which in a general way are intended to provide the same class of service as that given by the Federal Land Banks. These are the so-called Joint Stock Land Banks and already about seventy such institutions have been organized under the Act.

It must be understood that a Joint Stock Land Bank is not a small affair that may be set up as a local community enterprise. It must be organized by groups of not less than ten persons and with a capital stock of at least a quarter of a million dollars of which at least one half must be paid in cash. In a general way the powers and privileges of the Federal Land Banks and the Joint Stock Land Banks are similar.

Once having completed its organization and paid in its entire capital stock, the Joint Stock Bank may then proceed to issue bonds and to make loans up to an amount equal to fifteen times its capital stock. Both classes of banks

include in their mortgages an "amortization" feature, that is to say a fixed annual or semi-annual payment which not only takes care of the interest, but which also extinguishes the principal at the end of a long period, the exact length of which may vary but most commonly is about 34 years. As some one has well put it, it is "the kind of a mortgage that never comes due."

We may repeat then that both types of banks are organized under different sections of the same Act, both are designed to furnish the same type of service to farmer-borrowers and both have the same underlying regulations and control. There are about four respects in which there is a fundamental difference.

The first and most vital is that the Federal Land Banks are organizations that are specifically forbidden to operate for the purpose of private gain and any profit arising from their operation must be returned to their stockholders (that is to say their borrowers) in the form of dividends on their shares of stock. If this means anything, it means that the borrower secures his money "at cost"—that is, at the lowest rate at which it is possible to furnish it.

majority of farmers very properly refuse to see the least element of disgrace in carrying a mortgage. Let me say in passing that, of course, an appraiser must never gossip. I don't know if it is just a happenstance or a characteristic sex-difference but I have never yet met a man who appeared to care if the whole township knew about all his affairs. On the other hand I have met two or three women who first swore me to secrecy and then could hardly bring themselves to discuss their matters above a whisper.

There is one other rather important distinction between the two banks in the fact that the Joint Stock Banks do not require their borrowers to purchase any shares of stock, whereas the Federal Banks make every loan conditional upon the purchase of stock to the amount of five per cent of the loan. On the face of it, it is rather ridiculous to say to the man who has just given a mortgage for \$1,000, "We will give you \$950 in real money and \$50 in shares of our—or rather your—institution." Of course these shares are a very gilt edged investment and their value will be credited against the last payment but still most borrowers want cash rather than investments. The answer is that the Federal Land Banks are not organized to make a profit for any one, but is an absolutely cooperative enterprise and that the dividends on these shares is really their method of distributing their surplus—a surplus that in the case of a Joint Stock Bank would go into the pockets of the owners. The purchase—or better—the deduction for shares is all right if we can take the long look ahead but it sometimes seems rather hard on the man who feels that he needs in cash every possible dollar that his loan calls for. To be perfectly fair, it ought to be stated that theoretically those shares are assessable in case of insolvency—although this seems a rather remote contingency.

From what I can learn, the requirements of the Joint Stock Banks regarding what sort of property can be offered for loans, is less rigorous than in the case of the Federal Banks. The former can loan on land operated by tenants or held for speculative purposes while the latter are practically restricted to agricultural lands operated and controlled by the owner.

Perhaps it will be safest for me to sum the matter up in this fashion. Both plans can help the farmer and the amortization plan common to both, gives a safety and security and yet certainty of ultimate payment which is surely not a part of the usual short term loan. The old-time farm mortgage between friends and neighbors was generally a very human sort of document and it was usually construed in most liberal and kindly fashion. I do know, however, that more recently in the neighborhood of cities there is a tendency to sell lands on contracts that would draw a smile of approval—and envy—from Shylock. I am not much given to suggesting remedial legislation, but I do think that we might have some modification of our laws that would draw the teeth out of some of these smart-lawyer contracts which enable some land sharks to fleece the innocent and ignorant "back-to-the-lander." Much this sort of thing was done in behalf of the old time merciless life insurance contract and we might well recognize the principle of certain equities in contracts where part payments have been made.

"The Truth About Wire Fence"

SOLUTION OF THE MYSTERY THAT HAS COST FARMERS MILLIONS OF DOLLARS. A cedar post outlasts a pine, so two rolls of wire fence may look alike, and cost the same, yet one will last twice as long as the other. Our circular solves the puzzle and shows you how to save that 100 per cent. You can know what you are buying just as surely as you can tell Oak from Poplar.

Prospects in the Bean Market

Are Beans Coming Back as a Cash Crop?

IN response to good prices for the last two crops, bean producers planted six acres this year where they planted only five in 1922, and less than four acres in 1921. Nature was kind, and the yield per acre is above the average. The result is the largest crop of beans since 1918 and, with two exceptions, the largest in the ten years during which official estimates upon the crop have been compiled.

All the important bean producing States have a larger yield than in 1922 with the exception of California where the lima crop is considerably smaller than last year. The two years are compared in the following table which also reveals the relative importance of different States as bean producers:

	1923	1922
	Bushels	Bushels
New York	1,526	1,302
Michigan	6,248	4,809
California	4,336	4,778
Colorado	1,360	405
New Mexico	276	135
Arizona	46	24
Idaho	990	364
Wisconsin	154	76
Total	14,936	11,893

The United States is both an importer and an exporter of beans but normally the trade balance is on the import side, so that we consume more beans than we raise. The supply and distribution of the 1922 crop and the average for the five years 1917 to 1921 are given in the table below. The export and import totals are for the twelve months from September to the following August inclusive, covering the approximate year in which the crop is consumed.

This year's crop of 14,936,000 bushels is about 1,500,000 bushels more than were consumed in the United States in the preceding year and a like amount above the five-year average. Just how much our foreign trade will add to or take from the domestic supply is conjectural. During the last crop year, we imported practically 1,600,000 bushels more than we exported in spite of a supposedly high tariff of 1½ cents a pound on white beans. But, the five-year average import balance as given in the figures above was only 553,000 bushels.

	1922	Average 1917-1921
	Bushels	Bushels
Crop	11,893	13,025
Imports	2,247	2,623
Total supply	14,140	15,648
Exports	655	2,070
Apparent domestic consumption	13,485	13,578

Information as to bean crops in such countries as Japan, Hongkong, Chile, and parts of Europe from which our imported beans come is scanty, but thus far this fall our prices have been a little below the level at which beans could be imported profitably. In general, it does not seem likely that imports will be heavy. With a generous crop in this country, prices are likely to be more attractive to foreign buyers than they were last year and distributors are likely to push sales harder in all directions so that exports which go mostly to Cuba, Mexico, Canada and to northern Europe for relief work are likely to be larger than they were last year. This means that the import balance is apt to resemble the five-year average rather than that of 1922. This year. This means that the import balance would make a total of about 15,500,000 bushels for domestic consumption or about 2,000,000 bushels more than last year or the five-year average.

The apparently precise character of statistics such as are given above often implies a degree of accuracy and finality which they do not actually possess. They are always subject to revision in the light of later developments. Changes this year are most apt to be

on the side of a reduced supply. For example, threshing returns in some of the important States have not been up to expectations. Several sections had too much rain during the harvest season, so that pickage is running heavy. In Michigan, early returns indicated an average pickage of eight per cent which is considerably above normal. Two to four hundred thousand bushels may be subtracted from the merchantable supply in this way.

Trade conditions have been quite favorable thus far this year. The 1922 crop was well cleaned up before new beans came on the market. Most folks can afford to eat all they want so that the demand from wholesale grocers has been satisfactory. Elevators, handicapped by a shortage of labor to run picking machines, have been sold up to their capacity to get beans ready for shipment. Bad weather caused some delay and growers are reluctant to sell whenever prices drop, compelling elevators to bid up the market to get enough beans to fill their orders. The small crop of big limas in California puts them in a strong position.

Some of the dealers look for much cheaper beans later on. Perhaps the wish is father to the thought. They

Those who wish to "know beans" will be interested in the different members of the bean family, their special production areas and their markets which are to some extent independent of each other. A survey made by the Department of Agriculture on the 1918 crop revealed that of all the beans produced in the United States, 42 per cent were small white beans, 8 per cent large whites, the two together being known as pea or navy beans, 17.6 per cent pintos, 10 per cent limas, 5 per cent pinks, 3.7 per cent red kidneys, 3.2 per cent yellow eyes and the remainder a miscellaneous assortment including bayos, red Mexicans, cranberry, white kidney, blackeye, tepary beans and the like.

Michigan is the chief producer of white pea beans, its crop this year being about two-thirds of the total for the entire country. The State produces mostly small whites with a few large whites and three or four per cent of red kidneys. New York's crop includes 15 to 25 per cent of red kidneys, and 20 per cent yellow eyes but the State is also a big producer of white pea beans.

About 90 per cent of the Colorado and New Mexico crop consists of pintos or native Mexican beans. Arizona

raises mostly pinks. Limas make up about a third of the California crop and are produced along the southern coast. The valley and coastal region of central California raises small whites, large whites, pinks, blackeyes, and some red kidneys. Idaho raises a wide variety of beans as its crop is greatly prized for seed, but large and small whites predominate. Montana runs strongly to large whites.

Southern Idaho and the Yellowstone Valley in Montana produce a large white bean known as the Great Northern, the seed of which is said to have been first obtained from Indian mounds. It has been produced on a commercial scale for the last several years. Dealers are enthusiastic over this bean which is said to cook in from one-third to one-half the time required by regular pea beans, to have a sweeter taste and to be more digestible. It commands a decided premium over other pea beans. Occasionally it is passed off for the baby lima which it resembles in size, although not in shape. General opinion seems to be that production of this bean will expand greatly in the territory where it is now grown, but that its highly prized properties will be lost if it is grown in other sections.

Bean consumers have their peculiar habits also. The white beans of Michigan have the preference in the East and Middle West, and the price practically sets the market for the white beans of other sections. In Boston territory, however, California small whites are most popular. Red kidneys can be sold anywhere, a great many going to pork and bean factories. Pintos are sold mostly south of the Ohio River line, although sections where much of the population comes from southern Europe also are said to furnish a good market. The South buys baby limas, and the North the big limas, although there is some cross-over. Bean connoisseurs think the South shows the better judgment. In general, there have never been too many baby limas.

Great Northerns have been highly popular wherever introduced. In fact, some dealers assert that this bean which is being produced now to the extent of several hundred cars annually has stimulated consumption to that extent and has not affected the market for other beans although as its production expands, it will undoubtedly exert some influence on demand for other kinds.

This curve shows the trend of bean prices on the Chicago market

believe that the gaps in the wholesale trade channels will be filled up, that elevators will increase their picking capacity, that buyers will not need beans as fast as they will be offered and that growers must keep on selling even if prices go down.

The supply of white beans and pintos appears large and prices may not average as high as in the past two crop years when the Chicago average on pea beans was \$7.30 and \$6.90 per 100 pounds respectively, but no excuse is apparent for extremely cheap beans such as some of the dealers are looking for. The supply may be smaller than it is now believed to be. The fact that a large fraction of the crop is in the hands of cooperative organizations so that it will be fed on the market more gradually through the year has some bearing on the outcome. Furthermore, if the plans now on foot to advertise beans are carried out, another pillar of support will be placed under the market. Consumptive demand should be excellent right along and the United States during two war years consumed more beans than are in sight this year and at mighty good prices.

The accompanying graph portrays the course of prices of pea beans at Chicago by calendar years from 1913 to 1920 and by months during the last three crop years. It shows that beans have been materially above the pre-war level, particularly since early 1922. The Chicago price represents the Michigan shipping point price plus the freight and a handling charge. From the shipping point price must be deducted the charge for handling at the local elevator, something to cover risk of market fluctuations and the elevator profit in order to get the price to the grower for clean beans. To arrive at the value of beans "in the dirt," the cost of hand picking and the discarded beans which are paid for at the same rate as good beans must be deducted from the price to the grower for clean beans.

A Wise Old Trapper

In the state of Ohio there lived a bunch of boys who had this trapping business down to a science. They sent out for separate price lists every year and then sent all their furs to the house giving the best quotations. After five years they decided they weren't so dreadfully wise because they didn't have enough profits to make their efforts worth while.

One day they met Tom McMillan driving a new car to town. Tom said he made the price of his well outfit shipping pelts. He told how he got wise to those funny prices and found it was better to deal with Chas. Porter because he always knew in advance just what he was sure of getting. He said that Porter never offered him \$5 for a \$3 pelt but he always paid the \$3 which he promised and sometimes just a little better. Chas. Porter now has five wise trappers in that section instead of one.

Among the Farmers Of New York, New Jersey and Pennsylvania

THE Delaware County Farm and Home Bureau Association held a very successful annual meeting at Delhi on October 25th. Practically every community in the large county was represented and the old Town Hall was well crowded with the earnest men and women who believe in and support these worthwhile organizations. The morning was devoted to an interesting business session and the afternoon chiefly to two addresses, one by E. R. Eastman, Editor of American Agriculturist on "The Rural School Bill" and the other by Dr. Ruby Green Smith of the New York State College of Agriculture on "Community Life and the Farm and Home Bureau."

Perhaps the most striking thing about the meeting was the way in which nearly all of the other farm organizations of Delaware County were connected with the Farm Bureau. For instance, a committee which had been investigating poultry conditions in the county reported to the meeting through Mr. W. C. Fisher; the organized beekeepers made a report through Mr. Meade Elderkin; W. F. Sanford gave a report on the work of the cauliflower growers; John Gosper outlined the progress made by the County Breeders' Association. The Franklin Cow Testing Association reported through Mr. James Reid and the Andes Cow Testing Association was made by L. J. Frisbee. H. W. Harper gave a very interesting report illustrated with charts on the tuberculosis situation in Delaware County. All of these reports were in addition to the splendid progress report made by the Farm and Home Bureau.

Broome Co.—We are having some very excellent weather. The trees have now taken on their most beautiful colors. Silos are full, threshing is about finished, potato digging is about completed. The potato crop turned out much better than expected. There is lots of game this year and hunters make it unsafe for one to go near the woods. Butter, 50 to 55 cents a pound; eggs, 60 cents a dozen; fowls and chickens, 35 cents a pound.—L. K. C.

In Western New York

Ontario Co.—We have been having excellent weather for fall work, digging potatoes, picking apples. Fall feed is good and plentiful. The hay market is stronger.—H. D. S.

Wyoming Co.—Owing to unusually fine weather during the first three weeks of October, practically the entire potato crop has been harvested. No high yields are reported but the quality of the crop is good. Farmers are not selling many as yet, as the price offered is only 65 to 70 cents a bushel. Butter 55 cents a pound, eggs 55 cents a dozen. Beans are being threshed and fair yields are reported. The crop is moving to market very slowly.—L. M. F.

Genesee Co.—An epidemic of cerebrospinal meningitis, also known as forage poisoning, has broken out among live stock in various parts of the land. This is particularly true with horses. Already several head have died and a number of other cases have been reported. Since the outbreak many farmers have had their animals vaccinated.—W. H.

NEW JERSEY FARM NEWS

New Jersey farmers have been suffering from one of the worst dry spells in years. In fact the drouth became so acute that many industries in Jersey towns and cities were on the verge of closing down, due to the shortage of water. Many towns were so embarrassed by the water supply that rationing was being seriously contemplated. Farmers suffered likewise, never-failing wells even going dry. However during the week of October 22, torrential rains relieved the situation. In fact the rains came with a vengeance for considerable damage was done by the storm. Floods were reported and damage from wind was extreme in many cases.

Mercer Co.—Many farmers have been having their herds tested for

tuberculosis as the city of Princeton has passed a law that forbids the sale of milk from untested cows. Fall grains are all sown. Most farmers have finished cutting corn and are busy husking. The potato crop did not turn out as well as usual.—J. E. H.

Salem Co.—The sweet potato crop is very short. The early drouth hurt and retarded its development. Late potato crop is an uncertain quantity at present. A great deal depends on how long killing frosts hold off. Hay is very scarce. Most farmers in this section will have to buy their hay. Eggs also are very scarce and high. Tomatoes are as cheap as dirt. The pear crop is light.—S. B.

COMING FARMERS' MEETINGS

National Grange meeting, Pittsburg, Pa., November 14-23.

National Milk Producers' Association meeting, Pittsburg, Pa., November 8-9.

Inter-State Milk Producers' Association annual meeting, Philadelphia, Pa., December 3-4.

CENTRAL PENNSYLVANIA NOTES

J. N. GLOVER

Corn husking will be the main job for some time. The crop is not quite dry enough to crib in large amounts, but the weather is favorable for the work. "Tail-enders" filled their silos with dry frost-killed corn.

Wheat seeding was finished under very favorable conditions to start the young crop. Potatoes are practically all dug and are going to market from 75 cents to \$1 a bushel. Apple picking is about over, the crop selling anywhere from 60 cents to \$1.25 per bushel for good stock. Many apples are being trucked to the mining towns where they bring as high as \$1.75. Two cow sales were held at Brook Park this week, stock bringing from \$41 to \$121. Springers and heifers did not sell, as few farmers have enough dry feed to winter the extra stock. G. C. Slifer had his herd of registered Holsteins tested for tuberculosis recently. No reactors were found. Several farmers are getting loans from the Federal Land Bank in order to give them ample time to improve and pay for their farms.

Snyder Co.—We have been having excellent autumn weather with heavy frost. Corn is practically all cut and farmers busy husking. Wheat is looking good. Pastures are fine. Late potatoes turning out good. Winter apples made a fair crop. Silos were all filled. Wheat \$1 a bushel; corn \$1 a bushel; oats 40 cents; rye 70 cents; butter 40 cents a pound; eggs 42 cents a dozen. Flour \$6 a barrel; 3 per cent milk \$2.71 a hundred; 4 per cent, \$3.11 a hundred. Folks are generally in good health. Some reports of flu and colds.—S. D. D.

EASTERN PENNSYLVANIA NOTES

OLIVER D. SCHOCK

Milk prices prevailing in the retail trade are quoted as follows: Erie, Harrisburg and Philadelphia, 13 cents per quart; Pittsburg, 15 cents; Scranton and Reading, 14 cents. Dealers buying prices for milk testing 3½ per cent vary from \$.0527 to \$.0806 per quart. Harrisburg is paying from \$.0502 to \$.0662 to the producer in bulk.

A recent visit to the counties of Lehigh, Berks, Lebanon, Dauphin, Cumberland, Franklin and Perry reveal wheat fields in excellent condition. The germination of the seed and plant development is most favorable this fall.

HOW ABOUT FUEL?

How is the coal situation in your community? Can people get what they want? How is the quality? Are prices higher than last year? Is hardwood for sale in your community? What is the price per cord? Won't you help spread information and keep down profiteering by writing us a brief letter immediately about the fuel situation in your section?

What Is Wrong With the Cooperatives?

(Continued from page 315)

business efficiency. But efficient service was, and is however, the real test of the cooperative movement. Could the farmers be educated to this real purpose of organization? Could they be taught that there is no magic about organization and that it is only a method by which farmers can work together to produce, grade, pack and sell the farm products in such an efficient and orderly way as to beat all of the other old-established agencies, which had been doing the same thing for years? Could they be shown that their organization is themselves and that they could never take out more than they themselves put in? Some of the co-operatives have already failed to meet these tests. Those that were poorly organized or badly managed, or being run more on hot air than they were for real service began to show the sand in their gears. Some, like the Chicago Milk Producers' Association and the Oregon Dairymen's League, went on the rocks. Many others came mighty near the same fate; still others had to be re-organized to meet the changed conditions. Nearly all lost members. Of course, the dealers took this opportunity to increase prices and to otherwise make the way of cooperation more difficult.

Going Through The Test

In the country communities, bitter feelings were engendered, because of differences on the cooperative results. Most of those who belonged to the associations were bitter partisans in favor of them. Those who were out were called traitors. On the other hand, farmers who had failed to join for one reason or another were just as bitter against the members. Life-long friends became enemies; neighbors that had lived alongside one another perhaps for two generations and changed work, cared for one another in sickness and buried each other's dead, ceased to speak.

All great movements have had similar history. The cooperative movement has been and is going through the testing time, and out of that time of sacrifice, misunderstanding, enmity and bitterness some will come through stronger and better able than ever to solve the farmers' great economic troubles. Bitterness and hatred will pass away. They are going already. Most of those organizations that fail probably ought to. Those that are left on the job will, because of the experience through which they have been, have weeded out their inefficiencies, profited by their mistakes frankly recognized, studied and used the good methods of their dealer competitors; and in short, put their business on the same basis of other great enterprises and movements of history that have succeeded on a large scale.

Not Yet Out of the Woods

Just at the present time, the principle of cooperation as applied to farm marketing is not yet out of the woods. It has done the farmers a tremendous amount of good. Its advocates have a right to be enthusiastic about some of its accomplishments, so long as that enthusiasm does not make them over-confident. It is absolute foolishness to preach the success of cooperatives all the time without giving due heed to the failures and mistakes. The movement is too young yet and farm marketing is too complicated to be too sure about anything that concerns it. About the only thing we are sure of is that some kind of cooperative marketing is the only answer to the problem. Farmers have been painfully gathering experience in the different organizations. There has not been enough clear thinking on this experience for the enthusiasts have discussed only the good side of it, while the enemies have pointed out only the failures.

In succeeding articles, we hope to take up some of the different cooperative principles, one by one, and frankly discuss and analyze them as well as we can from the way these principles have worked in actual practice so far. We will also discuss some of the good and bad experiences of some of the cooperatives themselves. It is our hope that a discussion of the successes will make

(Continued on page 330)

for Economical Transportation

Every Farm Needs Two

EVERY farm needs two automobiles, one of which should be a closed model Chevrolet.

The open touring car is best for general farm use, carrying passengers or perhaps miscellaneous bulky produce or merchandise, but for cold or rainy weather, and for church or social use the family needs a closed car, either a 2-passenger Utility Coupé, as illustrated, or the 5-passenger Sedan. The extra large rear compartment is a feature of the Coupé.

These closed cars are very finely made, furnished, upholstered and trimmed. The windows are of plate glass and can be lowered, providing as much air as an open car, yet affording full protection against wind, rain, snow or cold when raised.

With a second car on a farm, one is always available for those at home when the other car is out.

The low prices of Chevrolet make the ownership of two cars feasible for most farm families.

NEW LAMP BURNS 94% AIR

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

On Maryland's Eastern Shore 136 Acres with 10 Cattle

6 horses, 13 hogs, implements, tools, corn, beans, oats, hay, straw, fodder; on fine improved road, close stores, school, church, only 2 miles from busy R. R. town; big city markets; 90 acres tillage for wheat, corn, oats, hay, potatoes, 35 acres woodland, balance pasture; only 100 fruit trees; handsome 2-story 6-room house, furnace, fine barns, stable, 5-room tenant house, granary, new poultry house. To settle affairs, all for \$10,500; part cash. Details, page 109, Illus. Catalog—Bargains many states. Copy free. STROUT FARM AGENCY, 150 R Nassau Street, New York City.

Don't Miss This Money-Saving Opportunity!

As a service to our readers we now offer some of the most remarkable magazine clubbing bargains that have ever been offered by any magazine. By taking advantage of these cut-price offers you are able to get practically twice as many magazines for the same money. Some of these offers will be withdrawn January 1st, so we urge every reader to lose no time in accepting one of these exceptionally attractive bargains.

More About Lights in the Poultry House

Do They Really Increase the Total Egg Yield of a Bird? — Fall Poultry Items

IT is a questionable fact if artificial illumination in the henhouse increases egg production. The ability or capacity of a hen to lay eggs is an inborn tendency, the result of good or bad breeding, while illumination is a purely external factor. It is simply one more force in the surroundings of a hen which contribute to her comfort and well being.

The confusion over the extra or increased egg production is natural enough to understand. Birds lay more eggs during the dark winter months; pullets especially lay more steadily and consistently because of illumination. It would seem, therefore, as if the production of the flock had been increased, and it is certainly a fact that more eggs are laid during the fall and winter. But it is also equally true that the spring and summer production decreases. Formerly birds lay themselves out in the spring and summer months; now birds lay consistently from the time they start until they finally moult in the fall. Illumination equalizes and stabilizes egg production, and the hen lays her eggs during eight or nine months instead of jamming her full production into six short months.

Illumination as a Tool

It is perhaps better to look at illumination simply as a tool and forget its so-called part in producing eggs. We can still make a hen lay about all the eggs she is capable of producing by feeding her in the right proportions. Likewise, our chances of keeping this same bird in good condition are increased because of the use of illumination. In the nights before its use was popular, the hen starved because her crop was not large enough to hold all the food her body could consume during the fourteen or fifteen hours of a dark winter night. Every bit of fat or surplus she had went to keep the machinery of her body going; there was nothing left for egg production, so that when the longer days of spring came and relieved her she layed with the speed of a racing automobile to try to catch up with herself. Illumination, therefore, saves her a double hardship; the strain of overproduction in the spring and the tragedy of simple starvation in the winter.

But just as feeding is a tool used for good or evil, so, likewise, is the light in the henhouse. No working day of combined natural and artificial light ought to exceed fourteen hours, and that light ought to be used consistently day in and day out during the same part of every succeeding twenty-four hours. Hens are great creatures of habit and irregularity can easily put a clog in the machine.

Safety Valves in the Use of Light

Of course, in the lighted henhouse there is always a safety valve. Poultrymen sometimes wonder at the moulting birds that show up in their flocks along in January or later. A bird that moults at this time means that there is a wrong condition existing somewhere, and an immediate check of all details governing the hens ought to be made. This spasmodic moult (often it is not a truly general moult but confined to the neck of the birds) must not be confused with a spring moult, for this last is the result of pure carelessness in discontinuing the use of lights in the spring. Too long a working day, irregular use of illumination, improper feed, disease,—in short, almost anything may throw some or all of the flock into a moult.

As regards the use of electricity on the different ages of birds, it is well to keep a few general applications in mind. It is a mistake to use it on pullets other than those that are well-combed out or just about full grown, perhaps even laying a little. To use lights on birds before they reach this stage of maturity is sure to lead to a stunting and general unevenness in the flock. On older birds, that is, those one year or older, there is no gain in using light while the birds are in the moult. To do so is to weaken the birds. A moulting hen has done a year's work; she has layed herself out, and what she needs during this period is

rest and good substantial feeding of the right sort. If she has laid late; if she is a bird worth saving, she will moult rapidly. Sometimes such birds are almost naked, they shed their feathers so quickly. By the last of December or the first of the year her new plumage will be well grown in and her comb will show signs of blood expanding it. Now turn on the light and the flock will respond rapidly. If you handle your yearlings and breeding birds in this way you will get the best in production and also good results in the breeding pen.

There is just one other factor of great importance in the lighted henhouse and that is green and succulent feed. There is so much said and written about this one element that to mention it ought to be enough. There is one way of stressing the point, however, that may still further show you its importance. By lengthening the day into fourteen hours, you automatically put the flock on a summer basis, barring the cold weather. Therefore, the hen must have the succulence and the greenness that goes with the summer conditions; otherwise she cannot do well.

To sum up the situation; the proper use of light well applied together with proper feeding may not produce more eggs, but it will insure a capacity production from the birds involved. By proper breeding and an increase in the laying ability of birds, the future indeed holds great possibilities for every able poultry keeper.—L. H. HISCOCK.

BUTTERMILK FOR POULTRY

Buttermilk is now recognized as one of the most necessary food digestive agents known for growing poultry due to the lactic acid it contains. This lactic acid acts on the grains consumed rendering more complete digestion.

Buttermilk is an animal protein food. It has a nutritive ratio of 1 to 1.6, and in each 100 pounds it supplies 3.84 pounds of digestible protein, 1.05 pounds of digestible fat, 3.92 pounds of digestible carbohydrates, and 0.7 pounds of ash.

Buttermilk is excellent for baby chicks, invaluable in cases of bowel troubles, both as a cure and preventative. As they grow older the chicks fed thus show remarkable strength and vigor. For growing stock there is nothing better. It puts vim in them, their food digests better, there is an absence of bowel troubles, their appetites are increased, and the chicks grow rapidly, maturing much earlier than chicks fed on any other ration.

It increases the fertility of the eggs, grows more eggs, imparts a richness to the meat making it more appetizing; prevents troubles with the digestive organs; lengthens the life of usefulness.

Milk in any form is valuable in poultry diet; skim milk is very good; sour milk is better, BUT buttermilk is best of all.—ELMER WHITTAKER.

TREATING SCALY LEG

Hens that are housed in damp quarters are the most apt to be infested with the mite which burrows beneath the scales of the legs causing the condition known as scaly legs. This can usually be cured in a short time by washing the legs with warm soap and water and then applying some coal-tar solution or with kerosene oil, rubbing in well.

The mite causing this trouble may spread from one fowl to another either on the roost or on the nest. Really, it is not a dangerous condition, but it ruins the birds for exhibition purposes until cured. It is an appearance not to be desired and must cause them some discomfort resulting in retarded egg production.

In our opinion, prevention is the best system in combating this trouble. If the sanitation of the house is right, it will rarely occur. We dislike using afflicted birds as breeders. This method helps to eliminate the pest from a flock quite rapidly and would indicate that there is some hereditary influence bear-

ing on the character of the trouble. Flocks where scaly leg is not to be found are plenty. Hens seem to become immune to it through sanitary conditions and careful breeding during the course of several generations.—WARNER E. FARVER.

TURKEYS HAVE COLDS

My turkeys act as if they had a cold. Their noses and eyes run. A lump twice the size of a kernel of corn comes in back of the nose and just below the eye. They eat good all the time.—MRS. E. L. Y., New York.

Catarrhal colds are quite common among turkeys in the fall and especially when they roost in trees near farm buildings or room over wet or unsanitary yards. When a hard lump forms in the nasal passage from the eye, roup is liable to follow. Unsanitary places should be cleaned up and limed and the affected birds given one teaspoon of epsom salts. It is also advisable to spray their eyes and nostrils with a 2% solution of boracic acid using a small nasal atomizer.—W. G. K.

HOW TO MAKE WHITEWASH FOR THE HENHOUSE

Slake half a bushel of unslaked lime with boiling water, cover during the process to keep in steam, strain the liquid through a fine sieve or strainer, and add to it a peck of salt (previously dissolved in warm water), three pounds of ground rice boiled to a thin paste and stirred in while hot, half a pound of Spanish whiting, and one pound of clear glue, previously dissolved by soaking in cold water and then hanging over a slow fire in a small pot hung in a larger one filled with water. Add five gallons of hot water to the mixture, stir well and let it stand a few days covered from dirt. It should be applied hot, for which purpose it can be kept in a kettle or portable furnace. The east end of the White House in Washington is embellished by this whitewash. It is recommended by the government for whitewashing light-houses.

A pint of this wash mixture, if properly applied, will cover one square yard, and will be almost as serviceable as paint for wood, brick, or stone, and is much cheaper than the cheapest paint.

Coloring matter may be added as desired. For cream color, add yellow ochre; pearl or lead, add lampblack or ivory-black; fawn, add proportionately four pounds of umber to one pound of Indian red and one pound of common lampblack; common stone color, add proportionately four pounds raw umber to two pounds lampblack.

USES KEROSENE TO KILL LICE

In 1914 I bought a flock of fifty hens and began caring for them in a poultry house that for several years had been abandoned every summer because of the hordes of lice with which it was infested.

Early in last spring before the weather warmed up at all, I cleaned the house thoroughly and sprayed with kerosene. My only tool was a 50-cent hand spray pump and I used less than a pint of kerosene—the pump works best when not too full, so I didn't quite fill it. I sprayed roof, walls and floor giving special attention to joints and cracks. Every bit of furniture—nests, roosts, etc., was well dosed and I never saw a louse or a mite. There seemed to be no need so I never sprayed again that year. The one thorough drenching before the vermin thawed out at all seemed all sufficient.

I believe there is nothing better than pure kerosene as an exterminator of such things and if I had ever discovered the slightest indication of any necessity for doing so I should have repeated the spray as often as needed. It should be sprayed, however; not poured or sprinkled on.—MRS. E. M. ANDERSON, New York.

Catch the chicken by lantern light and put it in a coop. Beats running it down with the children and dogs the next morning.

Rules For TB Testing

Barn Equipment a Real Utility

AMERICAN AGRICULTURIST has carried many authoritative and interesting articles on that terrible scourge of dairy cattle, tuberculosis. We feel, however, that there is still much haziness among the average dairymen as to just what some of the terms used in tuberculosis eradication work mean, and just how the plan of indemnities works.

"The primary object is to free cattle from tuberculosis, thereby improving the dairy breeds of cattle; and behind this is the demand for a clean and wholesome milk supply. That the bovine form of tuberculosis may be transmitted to the human family is conceded, experts having determined this by scientific investigation. This work is to be looked upon from an economic as well as a public health point of view, since great losses result from the inroads of the disease in the herds of the State.

"The principal feature is the application of the tuberculin test. There are three methods of applying this test—

this direction. In the beginning dairymen were somewhat reluctant to submit their herds to the test, due to a lack of knowledge of the benefits to be derived. There has been a wide dissemination of information on this problem and the value of the work is now more fully realized. At present there is practically a unanimity of opinion on the part of herd owners in every dairy county in favor of the testing of herds."

BARN EQUIPMENT A REAL UTILITY

The idea that barn equipment is merely a fanciful addition to fancy barns, and that all it does is to make the work easier in the barn is erroneous. It is not a very difficult matter to show that the modern types of equipment that have been developed by barn designers mean real profits in farm operation.

Take, for instance, the matter of hay-handling equipment. Nine out of ten

MILK PRODUCTION PER COW IN DIFFERENT COUNTRIES

THIS table will be interesting to every dairyman. It is impossible to get comparisons for the same years, but they are close enough for practical purposes. It is interesting to note that Canada with a much colder climate and shorter season has a larger average production per cow than does the United States. The table was compiled by the Bureau of Animal Industry of the United States Department of Agriculture.

Country	Year	Average yield of milk	Country	Year	Average yield of milk
Netherlands	1902	7,585	Norway	1910	3,680
Switzerland	1914	6,950	Sweden	1911	3,600
United Kingdom	1914	5,934	Japan	1918	3,339
Denmark	1914	5,666	Hungary	1914	2,932
Germany	1912	4,350	Australia	1916	2,719
Canada	1911	3,779	Italy	1914	2,279
United States	1917	3,716	Chile	1916	1,520
United States	1920	3,627	Siberia	1916	1,192

the subcutaneous, the intradermic, and the opthalmic. The subcutaneous test is a temperature test, and after the tuberculin has been administered, if the temperature of the animal rises to a certain point, it shows that the condition of the animal is tuberculous. In the intradermic test the tuberculin is injected at the base of the tail; if a lump rises at the point of injection, after a given time, this indicates a tuberculous condition. In the opthalmic test the tuberculin is placed in the eye of the animal. If there is an exudation from the eye, in a given period—or in other words, if the eye discharges—it is indicated that the animal is infected with tuberculosis.

"This tuberculin test is applied once and then if the animal on a test twelve months later fails to respond in such a manner as to indicate a tuberculous condition, it is held free from tuberculosis; and a herd of animals so tested is entitled to be declared accredited tuberculosis-free, or what is more commonly known as an 'Accredited Herd.'

Indemnities

"The owner receives payment for tuberculous cattle after they have been tested, condemned, and slaughtered under post-mortem by the State and Federal departments as follows:

"Maximum for pure-bred cattle, \$112.50 by the State; \$50 by the Federal Government. Maximum for grade cattle, \$67.50 by the State; \$25 by the Federal Government.

"In no case, however, can the owner receive more for an animal than the appraised value.

"In this work there is cooperation between the Federal Government and forty-five States. Its importance is shown by the action which has taken place in towns where ordinances have been passed which provide that only milk may be sold which comes from tuberculin tested cows.

"The work was started in New York State by the Department of Farms and Markets in 1919, in cooperation with the Federal Bureau of Animal Industry at Washington. Prior to this time little progress had been made in

barns built in these days are equipped with hay-carrier track which extends the entire length of the ridge. By its use, huge slings and forks full of hay are brought up into the mow, with very little manual labor required in mowing the hay away. Whereas in times gone by it would be a good half hour's job to get a load of hay into the far corners of the mow, now three or four minutes is all that is necessary, and it is accomplished with a tremendous saving of hard labor.

Another very economical item of equipment is the feed and litter carrier track which is used in transferring cars containing silage, corn, feed, and other feed supplies to the mangers, and similar cars for the removal of the manure. These are essential in every modern barn, and not only save time and labor, but help in the sanitation of the building.

Good mangers and stanchions in dairy barns, not only make the barn more sanitary, but they are more comfortable. They keep food clean, prevent it from being wasted, and simplify the care of the barn. Old-fashioned wood stanchions are entirely out of style, and the modern dairyman will not use them.

Automatic watering bowls are a great convenience for the dairyman and a great comfort for the cows. When water is supplied to the cows in this manner, milk production is increased and produced more economically. This does not mean that there is more water in the milk, but it does mean that the cows produce more milk on the same feed.—(K. C. R.)

ECZEMA IN HERD

I would like your advice in regard to my yearling stock. Their heads and shoulders are completely devoid of hair. The hide seems hard and crusty. What can I do for them?—W. E. F., Pennsylvania.

Apparently the animals are suffering from eczema. Try the following, which should be applied to the affected parts twice a day. You may have it compounded at your local pharmacy: Balsam Peru, 1 ounce; compound tincture benzoin, 3 drachms; zinc oxide, ½ ounce; vaseline, 8 ounces.

Buy The Best Silo on the Easiest Terms

For more than a quarter century the Harder has been the standard silo for Eastern Farmers. The earliest Harder Silos are still giving service. The new patented Harder-Victor Front is the most important silo improvement of recent years.

Now, you can buy this genuine improved Harder Silo on the most liberal terms ever offered to silo purchasers. You can meet the payments out of your milk checks, making the Harder pay for itself.

HARDER SILOS

You owe it to your business to investigate this new and different offer. Write for full particulars and our free book "Saving with Silos." Tell us how many cows you milk and we'll send you also a Handy Pocket Record Book, arranged to show income and outgo, profit and loss. You will be pleased.

HARDER MFG. CORP., Box F, Cobleskill, N. Y.

Speed Up MILK Production

Clip Your Cows

For cleaner, healthier cows. Healthier cows mean more milk, better fat and more milk profits. Clipping keeps cows free from filth and lice. The quick, easy, thorough way is with the

New Lamp Invention Beats Electricity

Beautiful Lamp Gives 400 Candle Power For Less Than ½ Cent A Night

Any home may now have the benefits of electric lights at practically no cost through the remarkable invention of B. J. Davis, a Kansas City expert mechanic.

This amazing invention called the Economy Lamp is beautifully designed and an ornament to any home. There is no wick, chimney or odor. It lights instantly and gives more light than 20 electric light bulbs, 27 lamps or 400 candles at a cost of less than ½ cent a night. It is so simple a child can operate it with perfect safety and carry it anywhere.

So proud is Mr. Davis of his invention that he wants to send an Economy Lamp free to try, to any reader of American Agriculturist who will write for it. If you want plenty of soft, brilliant, healthful light you should accept this generous offer without obligation by simply sending your name and address to B. J. Davis, 109 Economy Bldg., Kansas City, Mo., before this special introductory offer is withdrawn.

\$1,000 Insurance for 75c.

As a part of our broad policy of service to readers, we now offer you a \$1,000 Travel Accident Policy for one year with a three-year subscription for *American Agriculturist* all for only \$2.75—just 75 cents more than our special price for a three-year subscription alone.

This Tells You What the Policy Will Pay

The North American Accident Insurance Company will pay the following amounts, subject to the terms of the policy, for death or disability on a public carrier, due to its wrecking or disablement while the insured is riding as a fare-paying passenger, or due to the wrecking or disablement of any private horse-drawn or motor-driven vehicle on which insured may be riding or driving, or by being thrown therefrom.

Classified Advertising Rates

ADVERTISEMENTS are inserted in this department at the rate of 5 cents a word. The minimum charge per insertion is \$1 per week. Count as one word each initial, abbreviation and whole number, including name and address. Thus: "J. B. Jones, 44 E. Main St., Mount Morris, N. Y." counts as eleven words. Place your wants by following the style of the advertisements on this page.

The More You Tell, The Quicker You Sell

EVERY week the American Agriculturist reaches over 120,000 farmers in New York, New Jersey, Pennsylvania and adjacent States. Advertising orders must reach our office at 461 Fourth Avenue, New York City not later than the second Monday previous to date of issue. Cancellation orders must reach us on the same schedule. Because of the low rate to subscribers and their friends, cash or money order must accompany your order.

EGGS AND POULTRY

S. C. W. LEGHORN PULLETS—All from selected breeders; some Cornell Certified \$2 and \$3. Growing well, vigorous, sure to satisfy. Also Cornell Certified hens and males. ROY RATHBUN, Cincinnati, N. Y.

ROSE COMB BROWN LEGHORN COCKERELS, two dollars each "Maplewood" strain, thirty years breeding for heavy production. MAPLEWOOD YARDS, Milton, Vermont.

TOULOUSE AND EMDEN GEESE. Rouen ducks. Premier stock. Satisfaction guaranteed. Discount of \$1 pair to December 15. M. FELOCK, Newfield, N. Y.

COCKERELS—Tom Barron-strain, five months old, 250-300 egg breeding. Price, \$6. HOWARD CRISTIAN, Park View Farm, Ashland, N. Y.

PRIZE WINNING AFRICAN AND TOULOUSE GEESE. Golden Seabright Bantams. J. H. WORLEY, Mercer, Pa.

WHITE WYANDOTTE COCKERELS—Mammoth Pekin ducks. LAURA DECKER, Stanfordsville, N. Y.

WINTER CHICKS—Rocks, Reds, Leghorns. Catalog. WM. F. HILLPOT, Box 29, Frenchtown, N. J.

POULTRY SUPPLIES

POULTRY PLANT, 1,000 layers; 10,500 egg incubators; Boston Market: State Boulevard; electric lights. SILVERLAKE FARM, Tilton, N. H.

TURKEYS

TURKEYS—Bronze, Narragansetts, Bourbon, Reds, White, etc. None better in United States. Dark Cornish chickens. No orders accepted after December 20, write quick. WALTER CLARK, Freeport, Ohio.

MAMMOTH BRONZE TURKEYS—The largest on market. Big boned thoroughbreds, very distinct marking, prompt delivery F.O.B. FLORENCE McNICKLE, La Fargeville, N. Y.

BRONZE TURKEYS FOR SALE—Been free from blackhead for fifteen years. MRS. ALFRED E. REID, Star Route, Freehold, N. J.

PURE-BRED WHITE HOLLAND TOMS—No orders after December 1. MATTIE GREEN, Arcade, Wyoming Co., N. Y.

BEEES

HONEY—Clover and basswood 5 lbs. \$1.10; 10 lbs. \$2; buckwheat \$1 and \$1.75 postpaid. M. E. BALLARD, Roxbury, N. Y.

CLOVER HONEY, in 60 pound cans \$7.50; buckwheat, \$6.50 f.o.b. here. G. W. BELDEN, Berkshire, N. Y.

HONEY—Wixson's Pure Honey. Price list free. ROSCOE F. WIXSON, Dept. A, Dundee, New York.

CATTLE

ORCHARD GROVE MILKING SHORTHORN—One of the oldest and best producing herds. We have and are expecting more bull calves. Sold as babies only. Price \$50 while they last. State your wants early. L. HOTCHKISS, West Springfield, Erie Co., Pa.

REGISTERED JERSEY CALVES and Heifers for sale. T. B. Tested. For prices and information, BURLINGAME, HUTCHINS AND KING, INC., Room 1006, 7 Water Street, New York City.

AGENTS WANTED—Agents make a dollar an hour. Sell Mendets, a patent patch for instant mending leaks in all utensils. Sample package free. COLLETTE MFG. CO., Dept. 210, Amsterdam, N. Y.

Service Bureau

Beware of Barbarino Motors

EVER hear of the Barbarino Motors Corporation? If not, it's probably just as well for your own peace of mind!

For this is one of the ill-fated ventures into which so many small investors have recently been coaxed. Unfortunate speculators who sunk their money in the bankrupt Carlisle Tire Corporation are now being canvassed to give more to the equally untrustworthy Motors Corporation.

The organization has luxurious offices in an expensive Fifth Avenue building, where well-groomed salesmen talk to "prospects" in handsomely appointed

Beware of the Exchange Deal

FRAUDS are not practiced alone in selling "wildcat" stocks. A common game to beware of is the exchange deal. Slick tongued salesmen make a practice of offering to accept Liberty Bonds and other securities of equal value in exchange for stocks in oil wells and similar risks. The point on which they make a sale is that their oil stocks will yield four or five times as much as Liberty Bonds. If you are approached by a salesman who has such a proposition to offer, show him the gate and introduce him to the dog.—The Editors.

private offices. Over in Brooklyn at the address given as "the factory" is a garage, where five unfinished cars repose in the floor space, occupied by the "company." The Better Business Bureau reports that not a single car has ever been completed.

Approximately \$30,000 of the \$5,000,000 stock of the company has been sold to a trusting public and new schemes are now afloat, such as the "First-Lien Production Certificate" by which expansion is to be made possible. Behind the scheme lies the story of a trusting inventor; a shrewd promoter who took over his patents and assigned him mythical "rights" and a subsequent popular campaign by mail and personal selling to lure in the dollars for the promoter and a small inside "gang" in the plan.

All of which goes to show that it is still well to "investigate before you invest." Easy profits fade into hard experience all too soon. Better a reasonable interest with confidence than too-eager investment in some handsome gilt-edged paper and dividends that never come.

DEAL WITH HIGH-GRADE BROKERS

Financial Department:—What is your opinion of the Greenbaum Sons Investment Co. of Chicago, Ill.; also of the American Bond and Mortgage Co., Inc. of New York City?—L. V. M., Pennsylvania.

Many, if not all of the offerings of these houses selling bonds secured on real estate are good investments, but each must be judged on its merits as

the security is the specific property on which the bond is a lien. You should remember, too, that a security of this kind is not marketable. We think the most conservative bonds of this class are those offered by the Prudence Company, 162 Remsen street, Brooklyn, N. Y.

* * *

Financial Department:—Is the B. & O. R. R. preferred stock in your opinion a safe and good investment?—T. H. L., Pennsylvania.

It seems to us that a considerable measure of risk attaches to Baltimore & Ohio preferred stock as an investment, although the road is making a good record just now. So much depends on the attitude of the Government toward the railroads that it is difficult to appraise the investment status of their shares.

* * *

Financial Department:—Will you kindly inform me as to the reliability of the David A. Manville Co. as to their reliability in handling stocks and methods of doing business. Also I would appreciate it if you could give me the same information concerning the Security Transfer and Registrar Co. of 66 Broadway?—J. C. G., New York.

We cannot undertake to pass upon the standing of brokers, but we can suggest that you confine your business relations to firms that are members of the New York Stock Exchange or those your own home banker will indorse. If you are going to buy sound investment securities, and you should consider no others, you can always do it through very high-grade firms without taking needless chances.

* * *

Financial Department:—I have stock in the Interstate Mortgage Corporation. They have been urging me to buy some more stock and I feel that I have invested all the money that I care to lose. Is this stock safe or highly speculative?—R. G., New York.

The officers of the Interstate Mortgage Corporation appear to be responsible people and probably the enterprise is sound, but the stock certainly

STILL AT YOUR SERVICE

OUR legal department is still at the service of our readers. We are glad to be able to refer any questions which may be sent us to lawyers especially experienced in rural affairs. While there are some matters on which advice by mail cannot be safely given—such as family disputes or quarrels between neighbors in which someone would have to be on the ground to take evidence—there are hundreds of cases in which our expert legal service can be of great assistance.

Do not hesitate to use it. There is no charge to paid-up American Agriculturist subscribers. Always enclose the name label from the magazine.

has more or less of a speculative quality, as does stock in all finance companies, in our opinion. We would not care to have too large a proportion of our funds in any such security.

SEEDS AND NURSERY STOCKS

FRUIT TREES direct to planters in large or small lots by express, freight or parcel post. It will pay you to get our prices before buying. Free 68 page catalog. Peaches, apples, plums, pears, cherries, grapes, nuts, berries, pecans, vines. Ornamental trees, vines and shrubs. TENN. NURSERY CO., BOX 119, Cleveland, Tenn.

ALFALFA AND TIMOTHY HAY FOR SALE—Several cars for immediate or later loading. Also straw. W. A. WITHROW, R. 4, Syracuse, New York.

TWO-YEAR-OLD CONCORD GRAPE VINES, 10 for \$1.50, postpaid; 100 for \$12; 500 for \$50. E. A. MILLER, R. 3, Brookville, Pa.

HELP WANTED

ALL MEN, WOMEN, BOYS, GIRLS—17 to 65, willing to accept Government positions, \$117-\$250, traveling or stationary, write MR. OZMENT, 258, St. Louis, Mo., immediately.

A COMPETENT, RELIABLE WOMAN for family cook, all electric and gas appliances, private room and bath. Excellent opportunity is offered for all-winter employment to right person in very refined home located in center of Herkimer, N. Y., making environment almost ideal. Wages, \$50 per month. If interested, call or write C. H. S., 245 N. Main Street, Herkimer, N. Y.

HORSES

THIRTY SHETLAND AND WELSH PONIES—All ages for sale cheap to quick buyers. SENECA PONY FARMS, Salamanca, N. Y.

WOMEN'S WANTS

PATCHWORK—Send fifteen cents for household package, bright new calicoes and percales. Your money's worth every time. PATCHWORK COMPANY, Meriden, Conn.

OUR FAMOUS XMAS PRIZE PACKAGE 40 cents. Value guaranteed. Give age. Every package chuck full of surprises. HALSTED'S STORE, Torrington, Conn.

MISCELLANEOUS

SPECIAL PRICES on white enamel porcelain top kitchen and library tables, also chests, ironing-boards, and step-ladders. W. L. WEAVER, Germantown, Ohio.

LATEST STYLE SANITARY MILK TICKETS save money and time. Free delivery. Send for samples. TRAVERS BROTHERS, Dept. A, Gardner, Mass.

WANTED—A motor for an Oldsmobile, 1916 model. Address BOX 79, Cooperstown, Pa.

EVERYTHING PRINTED!—Samples free. FRANKLIN PRESS, B-28, Milford, N. H.

Answers to Questions From A. A. Readers

I am planning to build a barn and would like to know if lumber sawed out of cottonwood trees would be suitable for floor joists and rafters.—B. L. S., Indiana.

I AM quoting from a bulletin issued by the Purdue University regarding farm woodlot timber: "Very little Indiana cottonwood is manufactured into graded lumber, but if an owner has a considerable amount of first-class trees, an effort should be made to have it so utilized. Cottonwood lumber mixed with softwood is used principally for boxes, linings, woodenware and cheap furniture. In the log it is used most commonly in the box, fruit and vegetable package, slack cooperage, and excelsior industries. Ordinarily, these are about the only markets. Probably the easiest form in which to market cottonwood is as excelsior wood. Willow finds the same market as cottonwood at a slightly lower price. Neither of these woods is particularly valuable for posts, ties, or piling. Both have an average fuel value, and for this purpose are known as summer fuel."

Cottonwood is comparatively low in strength, and for this reason might not prove very satisfactory for structural purposes, especially in a building such as a barn, which is subjected to rather heavy strains, not only from exterior force, such as wind and weather, but also because of the heavy loads which the interior floors must often sustain.

It would seem that the best plan to follow in this case would be to sell the cottonwood lumber to some factory which could work it up into boxes or woodenware and use the proceeds of the sale for the purchase of more suitable timber.

MATERIALS FOR CONCRETE WALLS

I would like to know how much it will cost and how much material it will take to build a concrete wall for a building 20 by 40 feet, 8 feet high, not counting one door and four small windows and using a mixture of twice as much sand as cement and twice as much shale as sand? I would also like to know how much it would cost to excavate same cellar, estimating 148 cubic yards of earth, by using team and scoop as much as possible?—B. E. A., Pennsylvania.

In a building of this kind it will probably be necessary to have a wall a foot thick, assuming that it is to be a storage building or a barn, or similar structure. In this case, using a 1-2-4 mixture, it will be necessary to have about 45 barrels of cement, 13½ cubic yards of sand and 27½ cubic yards of coarser aggregate. If the walls are made thinner, the amount of material used will, of course, be less. For a 9-inch wall, the quantities will be three-fourths as much quantities given and for an 8-inch wall, two-thirds as much.

In regard to the cost of the concrete, it is impossible to say, as so much depends upon the local cost of materials and the local cost of labor. In the same way it is almost foolish to say how much the excavation would cost.

ACID ROCK AND LIME

I would like advice on acid rock and lime. This soil is heavy and wet and I would like very much to know how it would work on this soil? I have always used a lot of phosphate.—E. B. MOTT, St. Lawrence County, N. Y.

Without some definite knowledge of your land, I should not expect either acid rock or lime to be profitable. The one thing that seems in my experience to be worth while on wet land as a fertilizer is stable manure and grass the crop.

Most of us have seen a good deal of grass grow under these conditions. Aside from the clovers, our grass plants are surface feeding, and they can live in the water more than any of our cultivated plants. I don't mean that they can live in the water during the whole growing season, but in the spring-time and in the fall timothy can stand a lot of soaking, and stable manure will add plant food in a way to become available. Acid rock must also have water, but not in excess. Before buying lime or acidrock, I would drain the land.

Tiling is by all means the best, and I if you would call on Professor

R. H. Smith at the State School at Canton, he would be willing to help you lay out a system doing the work from time to time, as you have the time and money you want to invest, providing you do not want to make the investment all at once. If you want to see the results of tiling done many years ago, and effective now, drive to the George Harrington farm near Canton. I have land myself now growing alfalfa that was too wet for any kind of grass plants until tile were laid. There are many fields in Northern New York that have pockets, very wet spring and fall, and sometimes during the whole growing season, that can be connected by a run of tile with a common outlet and not try to drain the whole field, with a much less expense.

After the surplus water has been taken out, then begin experimenting. On our own farms acid rock has a very pronounced effect, while lime has less value. After the water is off and with a reasonable amount of fertility, you can grow clover; probably lime is what you want. Soils are so varying in New York State that about the only safe statement to make is this one; read what Hilgard, King and Roberts say about soils. Study your own farm and your neighbor's, and a lot of problems will seem to work out themselves.—H. E. Cook.

BRASS PIPE FOR PLUMBING

In installing a plumbing system in a farm house, would you recommend using brass pipe?—C. F. S., Ohio.

If I knew just the condition of your pocketbook, then I could give you definite advice. If you are going ahead with your plumbing installation regardless of expense, then I should say use the brass pipe for your plumbing. It will cost more than the iron pipe, but it undoubtedly will outlast it. The cost may not be so very much more, either, when you come right down to brass tacks.

There are very definite advantages in the use of brass pipe other than its durability. One thing, it is smoother on the inside, so that there is less friction, and the water will be delivered in greater volume than through an iron pipe of the same size. This may be a minor point, however.

With brass pipe you need never fear rust, of course, and this is a serious objection sometimes to iron pipe. Even galvanized iron pipe is not absolutely rust proof, because there may be a flaw in the galvanizing or the zinc coating may deteriorate.

Brass Calls for Smaller Pipe

Practical plumbers say that both for street service and cold water lines, and for hot water lines, much smaller brass pipe is necessary than iron pipe. For instance, where ¾-inch iron pipe would be used in a cold-water line, ½-inch brass pipe will do; while the same, brass pipe will give the same service as a 1-inch iron pipe in hot-water lines.

It is well to remember that the cost of pipe is really only a comparatively small part of the whole cost of the plumbing system, and when compared with the whole cost of a good house, it is so small as to be not worth fussing about at all.

TREATING "DOPY" HORSE

I have a horse that has been sick for two months. At first he would lift the hind leg during the day as though in pain. He did not lay down for periods of three weeks. He would just stand and lean against the side of the stall. When he would change position, he would simply stagger. I would say that he appeared to be "dopy." Do you suppose he could have been poisoned? Lately he seems to be gaining a little, but his ambition is all gone.—GEORGE SHEPPARD, Cayuga County, N. Y.

Your description does not give us enough information to make a complete or proper diagnosis. A strong cathartic such as raw linseed oil and salts followed by a tonic would not be out of order. Put him on a feed of bran and oats for a few weeks. If there is no change in that time, a good veterinarian should be consulted.

TRAPPERS

It's FREE Send for it

The Broad Highway—By Jeffery Farnol

"THE Lady Sophia Sefton of Cambourne?" said I.

"And—the Lady Helen Dunstan," he repeated.

"Do you know the Lady Sophia Sefton?"

"I have had the honor of dancing with her frequently," he answered.

"And is she so beautiful as they say?"

"She is the handsomest woman in London, one of your black-browed, deep-eyed goddesses, tall, and gracious, and most nobly shaped; though, sir, for my own part I prefer less fire and ice—a more gentle beauty."

"As, for instance, the Lady Helen Dunstan?" said I.

"Exactly!" nodded Mr. Beverley.

"Referring to the Lady Sophia Sefton," I pursued, "she is a reigning toast, I believe?"

"Gad, yes! her worshippers are legion, and chief among them his Royal Highness, and your cousin, Sir Maurice, who has actually had the temerity to enter the field as the Prince's avowed rival; no one but 'Buck' Vibart could be so madly rash!"

"A most fortunate lady!" said I.

"Mr. Vibart!" exclaimed my companion, cocking his battered hat and regarding me with a smouldering eye, "Mr. Vibart, I object to your tone; the noble Sefton's virtue is proud and high, and above even the breath of suspicion."

"It would almost seem," said I, after a pause, "that, from what I have inadvertently learned, my cousin has some dirty work afoot, though exactly what, I cannot imagine."

"My dear Mr. Vibart, your excellent cousin is forever up to something or other, and has escaped the well-merited consequences, more than once, owing to the favor of his friend—"

"George?" said I.

"Exactly!" said my companion, raising himself on his elbow, and nodding.

"Have you ever heard mention of Tom Cragg, the Pugilist?" I inquired, blowing a cloud of smoke into the air.

"A good fighter, but a rogue"—yawned my companion; "and a creature of your excellent cousin's."

"I guessed as much," I nodded, and forthwith plunged into an account of my meeting with the "craggy one," which seemed to amuse Mr. Beverley mightily, more especially when I related Cragg's mysterious disappearance.

"Oh, gad!" cried Beverley, wiping his eyes on the tattered lapel of his coat, "the resemblance served you luckily there; your cousin gave him the thrashing of his life, and poor Tom evidently thought he was in for another. That was the last you saw of him, I'll be bound."

"No, I met him afterwards beneath the gibbet on River Hill, where he gave me to understand that he recognized me despite my disguise, assumed, as he supposed, on account of his having kidnapped some one or other, and 'laid out' a certain Sir Jasper Trent in Wych Street according to my orders, or rather, my cousin's orders, the author of which outrage Sir Jasper had evidently found out—"

"The devil!" exclaimed Mr. Beverley, and sat up with a jerk.

"And furthermore," I went on, "he informed me that the Prince himself had given him the word to leave London until the affair had blown over."

NOW while I spoke, Mr. Beverley had been regarding me with a very strange expression.

"Mr. Beverley," said I, "what ails you?"

For a moment he did not speak, then answered, with the same strange look:

"Sir Jasper Trent—is my cousin, sir!"

"Indeed!" said I.

"Can you not see what this means, sir?" he went on hurriedly. "Jasper will fight."

"Indeed," said I again, "I fear so." "Jasper was always a bit of a fish, and with no particular affection for his graceless kinsman, but I am his only relative; and—and he hardly knows one end of a pistol from the other, while your cousin is a dead shot."

"My cousin!" I exclaimed; "then it was he—to be sure I saw only his back."

"Sir Jasper is unmarried—has no relations but myself," my companion repeated, with the same fixed intendment of look; "can you appreciate, I wonder, what this would mean to me?"

"Rank, and fortune, and London," said I.

"No, no!" He sprang to his feet, and threw wide his ragged arms with a swift, passionate gesture. "It means, Life—and Helen. My God!" he went on, speaking almost in a whisper, "I

never knew how much I wanted her—how much I had wilfully tossed aside—till now! I never realized the full misery of it all—till now! I could have starved very well in time, and managed it as quietly as most other ruined fools. But now—to see the chance of beginning again, of coming back to self-respect and—Helen!" And, of a sudden, he cast himself upon his face, and so lay. Then, almost as suddenly, he was upon his feet again, and had caught up his hat. "Sir," said he somewhat shamefacedly, smoothing its ruffled nap with fingers that still quivered, "pray forgive that little ebullition of feeling; it is over—quite over, but your tidings affected me."

"Indeed," said I, "you seemed strangely perturbed."

"Mr. Vibart," said he, staring very hard at the battered hat, and turning it round and round, "Mr. Vibart, the devil is surprisingly strong in some of us."

"True," said I.

AND for a moment, Mr. Vibart, I was tempted to sit down in the ditch again, and let things take their course. The devil, I repeat, is remarkably strong in some of us."

"Then what is your present intention?"

"I am going to London to find Sir Maurice Vibart—to stop this duel."

"Impossible!" said I.

"But you see, sir, it so happens that I am possessed of certain intelligence which might make Sir Maurice's existence in England positively untenable."

"Nevertheless," said I, "it is impossible."

"That remains to be seen, Mr. Vibart," said he, and speaking, turned upon his heel.

"One moment," said I, "was not your cousin, Sir Jasper, of middle height, slim-built and fair-haired, with a habit of plucking at his lips when nervous?"

"Exactly; you know him, sir?"

"No," I answered, "but I have seen him, very lately, and I say again to stop this duel is an impossibility."

"Do you mean—" he began and paused. Now, as his eyes met mine, the battered hat escaped his fingers, and lay all unheeded.

"Yes," said I, "I mean that you are too late. Sir Jasper was killed at a place called Deepdene Wood, no longer since than to-day at half-past seven in the morning."

For a long moment Mr. Beverley stood silent with bent head, then, apparently becoming aware of the hat at his feet, he sent it flying with a sudden kick. Which done, he walked after it, and returned, brushing it very carefully with his ragged cuff.

"And—you are sure—quite sure, Mr. Vibart?" he inquired, smoothing the broken brim with the greatest solicitude.

"I stood behind a hedge, and watched it done," said I.

"Then—I am Sir Peregrine Beverley! Jasper—dead! A knight banneret of Kent, and Justice of the Peace! How preposterous it all sounds! But to-day I begin life anew, ah, yes, a new life! To-day all things are possible again! But come," said he in a more natural tone, "let us get back to our ditch, and while you tell me the particulars, if you don't object I should much like to try a whiff at that pipe of yours."

So, while I recounted the affair as briefly as I might, he sat puffing at my pipe, and staring away into the dis-

tance. But gradually his head sank lower and lower, until his face was quite hidden from me, and for a long moment after I had ended my narration, there was silence.

"Poor Jasper!" said he at last, without raising his head, "poor old Jasper!"

"I congratulate you, Sir Peregrine," said I.

"And I used to pummel him so, when we were boys together at Eton—poor old Jasper!" And, presently, he handed me my pipe, and rose. "Mr. Vibart," said he, "it would seem that by no virtue of my own, I am to win free of this howling desolation, after all; believe me, I would gladly take you with me. Had I not met with you it is—rather more than probable—that I—should never have seen another dawn; so if ever I can be of—use to you, pray honor me so far; you can always hear of me at Burnham Hall, Pembry. Good-by, Mr. Vibart, I am going to her—in all my rags—for I am a man again."

So I bade him good-by, and, sitting in the ditch, watched him stride away to his new life. Presently, reaching the brow of the hill (there are hills everywhere in the South country), I saw him turn to flourish the battered hat ere he disappeared from my sight.

CHAPTER XV

IN WHICH I MEET WITH A PEDLER BY NAME OF "GABBING" DICK

"YOU won't be wantin' ever a broom, now?"

I sat up, sleepily, and rubbed my eyes. The sun was gone, and the blue sky had changed to a deep purple, set here and there with a quivering star. Yet the light was still strong enough to enable me to distinguish the speaker—a short, thick-set man. Upon his shoulder he carried a bundle of brooms, a pack was slung to his back, while round his neck there dangled a heterogeneous collection of articles—ribbons, laces, tawdry neck chains, and the like.

"You won't be wantin' ever a broom, now?" he repeated, in a somewhat melancholy tone.

"No," said I.

"A belt, now," he suggested mournfully, "a fine leather belt wi' a steel buckle made in Brummagem as ever was, and all for a shillin'; what d'ye say to a fine belt?"

"That I have no need of one, thank you."

"Ah, well!" said the man, spitting dejectedly at a patch of shadow, "I thought as much; you aren't got the look of a buyer."

"Then why ask me?"

"Hinstinct!" said he, "it's jest hinstinct—it comes as nat'ral to me as eatin', or walkin' these 'ere roads."

"Have you come far to-day?"

"Twenty mile, maybe," he answered, setting down his bundle of brooms.

"And how is trade?"

"Could n't be worse!"

"I perceive you are a pessimist," said I.

"No," said he, "I'm a pedler—baptism! name Richard, commonly known as 'Gabbin' Dick.'"

"At least yours is a fine healthy trade," said I.

"Ow so?"

"A life of constant exercise, and fresh air; to-day for instance—"

"Ah! an' with dust enough to choke a man! And then there's the loneliness o' these 'ere roads."

"Loneliness?" said I.

"That's the word; sometimes it gets so bad as I'm minded to do away wi' myself—"

"Strange!" I began.

"Not a bit," said he; "when you've

been a-walkin' an' a-walkin' all day past 'edge and 'edge, and tree and tree, it's bad enough, but it's worse when the sun's gone out an' you foller the glimmer 'o' the road on and on, past 'edges as ain't 'edges, and trees as ain't trees, but things as touch you as you pass, and reach out arter you in the dark, behind."

"Do you mean that you are afraid?" I inquired.

"No, not afeared exactly; it's jest the loneliness—the lonely quietness. Why, Lord! you are n't got no notion o' the tricks the trees and 'edges gets up to 'a' nights—nobody 'as but us as tramps the roads. Bill Nye knowed, same as I know, but Bill Nye's dead; cut 'is throat, 'e did, wi' one o' 'is own razors—under a 'edge."

"And what for?" I inquired, as the Pedler paused to spit lugubriously into the road again.

"Nobody knowed but me. William Nye 'e were a tinker, and a rare, merry 'un 'e were—a little man always up to 'is jokin' and laughin'. 'Dick,' 'e used to say 'd' ye know that their big oak-tree—the big, 'oller oak as stands at the crossroads a mile and a 'alf out o' Cranbrook? A man might do for 'isself very nice, and quiet, tucked away inside of it, Dick,' says 'e; 'it's such a nice, quiet place, so snug and dark, I wonder as nobody does.' Well, one day, sure enough, poor Bill Nye disappeared—nobody knowed wheer. At last, one evenin' I 'appened to pass the big oak—the 'oller oak, and mindin' Bill's words, thinks I—'ere 's to see if 't is empty as Bill said. Goin' up to it I got down on my 'ands and knees, and, strikin' a light, looked inside; and there, sure enough, was poor Bill Nye hunched up inside of it wi' a razor in 'is 'and, and 'is 'ead nigh cut off—and what wi' one thing and another, a very unpleasant sight 'e were."

"And why—why did he do it?" I asked.

"Because 'e 'ad to, o' course—it's jest the loneliness. They'll find me some day, danglin'—I never could abide blood myself—danglin' to the thing as looks like a oaktree in the daytime."

"What do you mean?" said I.

The Pedler sighed, shook his head, and shouldered his brooms.

"It's jest the loneliness!" said he, and, spitting over his shoulder, trudged upon his way.

CHAPTER XVI

HOW I HEARD THE STEPS OF ONE WHO DOGGED ME IN THE SHADOWS

AND, in a little while, I rose, and buckled on my knapsack. The shadows were creeping on apace, but the sky was wonderfully clear, while, low down upon the horizon, I saw the full orb'd moon, very broad and big. It would be a brilliant night later, and this knowledge rejoiced me not a little.

Before me stretched a succession of hills, over which the dim road dipped, and wound, with, on either hand, a rolling country, dark with wood, full of mystery. The wind had quite fallen, but from the hedges came sudden rustlings and soft, unaccountable noises.

And, as I walked, I bethought me of poor Bill Nye, the Tinker. I could picture him tramping upon this very road, his jingling load upon his back, and the "loneliness" upon and around him. A small man, he would be, with a peaked face, little, round, twinkling eyes, grizzled hair, and a long, blue chin. How I came to know all this I cannot tell, only it seemed he must be so. On he went through the shadows,

(Continued on page 329)

WHAT HAS HAPPENED SO FAR

PETER VIBART finds that his striking resemblance to his cousin Sir Maurice, causes strangers to mistake him for that notorious rascal. Among them are a prize-fighter, two "dandies" of the period, and a tattered young gentleman who offers to fight him, but who shares Peter's humble meal when he discovers his mistake. The conversation turns to the gay doings of London society, and young Beverley mentions Lady Sophia Sefton as a famous beauty. Peter's uncle having left him a fortune on condition he marry this lady, whom he has never seen, he has preferred to take, penniless, to the Broad Highway.

Embroidery Designs

Stamped on Good Materials and All Ready to Work

Efficient Method of Modern Farm Lighting

The Advantages of a Carbide Plant Described—Recipes and Patterns for the Fall

THINK of the amount of work saved on a farm by the installation of a modern lighting plant! The saving of labor alone should make it worth while for every country family to have one, but in addition, good lights play a very important part in providing a livable, contented home for both the young people and the older folks. The solid enjoyment such a convenience gives cannot be measured in terms of dollars and cents.

It is because I have experienced this blessing myself—after, I admit, some doubt as to whether the installation "would pay"—that I feel as though I wanted to urge every farm family to invest in a modern lighting plant. The carbide gas plant is one of the least expensive and the most successful methods of lighting farmhouses and outbuildings; indeed, I have talked with many who after trying various other systems, come back to the carbide gas as the best and most practical from the standpoint of an all-year-round, dollars-and-cents proposition, as well as from the viewpoint of the small amount of labor involved and the extremely soft and pleasant light this type of gas gives.

Since in spite of the many such plants in successful operation, some farmers seem not to understand its principles, it might be well to explain the "workings" of the acetylene or carbide plants. Perhaps it is because they are so very simple that people feel there must be some "trick." A generator is placed in an outdoor sunken well. The carbide goes in that; water is added, and this generates the gas. It is piped into the house and there lighted in the modern chandeliers and single fixtures. Since the well is at a good distance from the house, there can be no danger. Then, too, the gas has such a characteristic odor that any leak is instantly detected and the individual fixture can be shut off—although as the gas is non-asphyxiating, there is never the danger which comes from the usual escape of gas.

Carbide Lighting Never Unsightly

The pipes need be laid only a few inches beneath the surface of the ground, enough to prevent them from being bent if heavy loads are driven over. The covered well is far from unsightly, and may be further concealed by bushes or flowers, if the housewife has a garden.

The day of coal-oil lamps is past and there is no excuse for poor lights in country homes. Think of the hours

from the rural districts to the better lighted cities. The toll taken in poor eyesight is another count against the lamp, for though excellent ones are obtainable, all too many have been far too feeble for steady use at night.

It is especially here that the acetylene is a boon. No light is softer, yet it is amply strong, and our fixtures illuminate the entire room. We find we can read, study or sew at night with far less fatigue than with either oil-lamps or the more glaring electricity. Inverted globes throw the light down, and plain ones, we find, are more satisfactory than the frosted type.

Cooking and Ironing Attachments

Any farm woman who cooks for a good sized family depends largely upon her big kitchen stove for her regular cooking. But a three-burner gas plate, placed on a zinc-covered shelf by the fuel range and on a level with it, is a great "overflow" help and can be depended on largely in summer. I have found that, by using a gas oven, I didn't need to start a fire in the range on the hottest days. The heat can be regulated, and is more satisfactory than either an oil or a gasoline stove. We have a zinc cover to fit over the top of the burners. This helps keep them clean and makes a convenient shelf when the gas is not in use.

I know that some of my neighbors use the hot plate very little, but I believe that it is worth getting acquainted with this cooking attachment.

A one-burner gas plate in the bathroom is a step saver for the housewife, particularly if there are little children or invalids in the house.

Then too, there is the sad iron attachment, often easier to use than the hot range. One of my neighbors tells me that she finds that for some reason the carbide-heated iron does not scorch her clothes as readily as does the other type. This is probably a matter of individual opinion, but the sad-iron attachment is, in any case, a valuable one for the woman who does a good deal of pressing.

It is not the wife only who profits by the carbide system, for it provides good lights on the porch, in the barn, the garage, poultry house and any other outbuildings where lighting is desirable. The farmer may visit the garage without the dangerous lantern; he can "speed up" his hens and get more eggs by intelligent use of acetylene gas fixtures in the hen houses.

With the outside wells, there need be no fear of danger or fire. No open

passing stranger. For the well-lighted home encourages sociability; and to it men and women, and young people too, instinctively turn for their good times

The Porch Light

and social affairs. If for no other reason than this, the expenditure for a good lighting plant is one which no farm family should grudge. It pays dividends in physical health and in the greater contentment and happiness of every person within the home.—GERTRUDE VAUGHAN.

IN SWEET POTATO TIME

NOT all farm housewives know that sweet potatoes can be used to a wholesome advantage, in a number of delightful dishes. If the family are unusually fond of sweet potatoes, try those delicious recipes given below:

Sweet Potato Muffins

Sift together 1½ cups flour, 4 teaspoons baking powder and 1 teaspoon

salt. Then add 1 cup cooked mashed sweet potatoes with 1 cup milk or water. Beat in an egg and finally add 2 tablespoons melted butter, partly fill well-greased muffin pans and bake in a quick oven.

Southern Sweets

Clean 5 good-sized sweet potatoes and boil rapidly until soft. Remove from the fire, peel them, and cut them into slices half and inch thick. Place in a well-buttered pan, sprinkle with salt and ½ cup brown sugar. On each slice, place a tablespoon butter and over all, squeeze the juice of half a lemon. Brown in a quick oven.

Sweet Potato Souffle

Wash well, then boil 6 large sweet potatoes. When done, scoop out the pulp and pass through a vegetable strainer. Add 1 cup milk, 1 well beaten egg, 2 tablespoons butter and ½ teaspoon grated nutmeg. Pour into a well-greased pan or mold and bake until brown.

Mashed Sweet Potatoes

Boil the usual quantity of sweet potatoes in their jackets, till soft. Drain them, set in the oven, for five minutes to dry out. Peel them and mash, season with melted butter, pepper, salt and paprika. Moisten with a little sweet cream, beat well, then turn them into a buttered baking dish. Boil three tablespoons sirup, with a tablespoon butter for three minutes. Pour it over the potatoes and place them in the oven. Bake until brown.

Fluffy Sweet Potatoes

Pare and boil enough sweet potatoes for the meal until tender in just enough water to cover them. Drain, but not entirely dry and mash them. Add enough sugar to taste, and beat in enough butter to make them fluffy and light. Heap lightly in pretty dish and serve.—PAULINE CARMEN.

I find your patterns very good and just as satisfactory as those costing much more.—Mrs. H. P. S., New York.

Three-burner gas plate on shelf back of range. A tin or zinc cover converts it into a convenient shelf

that have been spent in filling, trimming and cleaning lamps, to say nothing of the steps getting and collecting them from the different rooms! The carbide plant furnishes a blessed relief from soiled, sticky hands, the smell of oil and the eternal vigilance required by the old-fashioned single lamps.

It is not just the convenience that we value. Certainly people in the country are as much entitled to good lights as their city relatives! Poor lights have played their part—and a bigger one than many suspect—in driving young people and their elders too

flame, of course, should be taken near the generator; if anyone is so foolish as to experiment, however, the rest of the family will not pay the penalty! The ordinary caution observed around any possibly explosive substance should be second nature by now to the man who handles gasoline, dynamite and inflammable oils of any sort.

What a pleasure it is, when driving in the country at night, to come suddenly upon a farm home illuminated like one in the city! It fills one's heart with cheer and be it said, is as cheering to the neighbor as to the

TWO STUNNING DRESSES AND A SCHOOL FROCK

No. 1899 a smart little one-piece dress which is very easy to make and will give excellent service for school wear. It is cut in sizes, 4, 6, 8, 10, and 12 years. Size 8 requires 1½ yards material with ¼ yards of braid. **Price 12c.**

No. 1900 is especially adaptable to the full or mature figured woman. The pattern cuts in sizes 36, 38, 40, 42, 44, 46, 48 inches bust measure. Size 36 requires 3½ yards 54-inch material with ¾ yard contrasting. **Price 12c.** The embroidery pattern **No. 668** costs 12c extra. The dress is greatly enhanced by handwork in gay colors, but is perfectly suitable with only the contrasting material for trimming.

No. 1903 is a smart dress for informal wear. The skirt is made from two pieces and the blouse from one. Embroidery supplies the only decorative note, but this style would be equally charming with no trimming. Cut in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 requires 3½ yards 40-inch material with 6¼ yards of binding. **Price 12c.** stamps. The embroidery pattern **No. 657** cost 12c extra.

To Order: Write name, address, pattern number and sizes very clearly; enclose proper remittance in stamps or coin (wrap coins carefully; stamps are safer) and mail to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York, N. Y.

What 10c Will Buy: A copy of our big Fall and Winter Fashion Book. More than a pattern catalogue, it is really a dictionary of style. You need one to consult for dozens of dressmaking purposes. It is only 10 cents a copy—add the amount to your order.

Use of Orange and Grapefruit Peels

Emma Gary Wallace Describes Satisfactory Candying Process

WITH the present need for thrift, we must be diligent in looking after the little things, for they go to make up the big ones.

Some very delicious additions to the daily menu may be prepared by making use of grapefruit, orange and lemon peels. Most people throw away grapefruit peel because of its extreme bitterness. However, it is delicious preserved or candied and used wherever citron peel or orange peel would be suitable, as in cakes and puddings. Other flavoring is not necessary.

If the peels are used from whole grapefruit, each one should be immersed in boiling hot water for five minutes. This facilitates the removal of the skin, which should be cut away from the pulp of the fruit, leaving as little of the inner white coating attached to that pulp as possible. The segments of peel may then be spread out and scraped, to remove as much of this inner lining as is practical.

If grapefruit peel is used from which the pulp has already been cut away, the walls of the segments can be scraped with a knife until quite clean. The pulp should now be cut into narrow strips about two inches long. The peels may be dropped into cold, salt water and allowed to stand a couple of hours. After this, the salt water is drained off and the peel covered with a solution made of one part of lime water and two parts of clear water.

Lime water makes the tough outer surface tender. A large bottle can be obtained for a few cents at the drug store.

How to Preserve Grapefruit Peel

Bring the grapefruit peel and the solution covering it to the boiling point, simmering slowly for half an hour. Pour off this liquid, which will have extracted much of the bitterness, cover again with plain cold water, and boil another half hour. This water also is discarded. Repeat the third time, press out the liquid and throw it away.

The grapefruit peel will now have a mildly bitter flavor which is desirable. If one wishes a milder flavor still, a fourth or fifth boiling will insure it.

Press the peel with the spoon to extract the water. Have ready a syrup made by taking equal measurements of sugar and water and just allowed to dissolve. Add the grapefruit peel to this syrup, cover, and allow to simmer for one hour and a half. Do not allow it to reach the boiling point. Uncover and bring to a boiling point at this stage, continuing the cooking until a thick syrupy mass is obtained of a

it is put in the sunshine, so much the better.

When dry and well candied, drop the preserved peel into clean glass fruit jar. It will keep for a long time and may be used as an after-dinner confection if one desires. Pieces of this peel dipped in melted chocolate, make delicious candies; or cut into fine slivers can be used in cream candy, giving it an unusual taste.

The process may sound tedious, but is really little trouble, as the work can be done while other duties are attended to, only keeping an eye on the grapefruit peel to see that the processing is properly followed up.

A product which remains soft and does not grow hard even with passing time, is prepared by following this process, only using the invert sugar or syrup employed by commercial manufacturers. A candy or ice cream maker can furnish this. Invert sugar never crystallizes, and products prepared with it remain soft. This is largely true also with honey.

Candy Orange and Lemon Peel

Orange peel or lemon peel may be candied with rather less trouble. Most of the white inner material is scraped away and the portions of peel cut into strips about an inch and a half long. No scalding in hot water is necessary, neither do we use the lime solution.

Cover with water and boil slowly for an hour, adding more water so that the peel will be covered all the time. Discard this water and add more boiling water, repeating the process for half an hour. By this time, the peel should be tender and almost transparent. Drain it and cook in the syrup made of half sugar and half water until the syrup is quite thick. Drain. Roll in the powdered sugar, dry as in the case of the grape fruit, and put away in covered clean jars for future use.

As these will all look much alike, they should be labeled. Chopped, the orange or lemon is particularly good mixed with icing, or to give variety to cake. Some housewives value it very highly in mincemeat.

RAINY-DAY "SUNSHINE"

Who likes rainy days? Very few people, I'm afraid; but our family is the exception to the rule.

As we have to accept rainy weather anyway, why not like it and teach the children to, also?

On rainy days, Dad nearly always has work to do in the shop, and Biggest

On such occasions I prepare some of our favorite foods for the meals or perhaps serve a "plate supper" beside the living-room stove.

Sometimes I make up some well-balanced sandwiches and with cocoa and milk to drink and caraway cookies to nibble on for dessert we have an "inside picnic."

It is a bother at times, but it is worth while and makes us all more content with farm life.—MABELLE ROBERTS.

The Broad Highway

(Continued from page 326)

on and on. Presently he turned out of the road, and there, sure enough, was the oak. Kneeling down, he slipped off his burden and pushed it through a jagged hole at the root. Then he glanced round him, a long, stealthy look, down at the earth and up at the sky, and crept into the tree. In the dimness I could see him fumble for the thing he wanted, pause to thumb its edge, and, throwing up his chin, raise his hand—

"Folly!" said I aloud, and stopped suddenly in my stride.

The moon's rim was just topping the trees to my left, and its light, feeble though it was as yet, served to show that I had reached a place where four roads met.

Now, casting my eyes about me, they were attracted by a great tree that grew near by, a tree of vast girth and bigness. And, as I looked, I saw that it was an oak-tree near the root of which there was a jagged, black hole.

Headless of my direction, I hurried away, yet, even when I had left it far behind, I glanced back more than once ere its towering branches were lost to my view.

So I walked on through the shadows, past trees that were not trees, and hedges that were not hedges, but frightful phantoms, rather, lifting menacing arms above my head, and reaching after me with clutching fingers. Time and again, ashamed of such weakness, I cursed myself for an imaginative fool, but kept well in the middle of the road, and grasped my staff firmly, notwithstanding.

I had gone, perhaps, some mile or so in this way, when I suddenly fancied I heard a step behind me, and swung round upon my heel, with ready stick; but the road stretched away—empty as far as I could see. Having looked about me on all sides, I presently went on again, yet, immediately, it seemed that the steps began also, keeping time with my own, now slow, now fast, now slow again; but, whenever I turned, the road behind was apparently as empty and desolate as ever.

(To be continued)

HER OCCUPATION

MOTHER was registered duly because she was anxious to vote, The questions she answered truly, of each statement the clerk made a note,

But mother felt some indignation, decidedly peeved she became, When she found the words, "no occupation" were written right after her name!

For mother gets up every morning before the first daylight has come, And laziness heartily scorning, she does all the work of the home. By way of a mild relaxation, she works in the garden patch, too, For some one with "no occupation" she really finds plenty to do! The children are always dressed neatly, of course that means sewing galore, She cares for the poultry completely, sells butter and eggs at the store. She's busy without much cessation, you never could say she was slow, For some one with "no occupation" why mother keeps quite on the go! There's washing and sewing and mending, and all of these items mean work, To each you'll find mother attending, O, no one could call her a shirk! So she cannot feel calm resignation—do you think, Uncle Sam, she's to blame

When she finds the words "no occupation" on the record right after her name?—ELSIE D. YALE.

jellylike nature, or until the candy thermometer shows from 218 to 220 degrees F. To allow the syrup to become hotter than this, is to harden the peel.

Now remove the peel with a skimmer or by turning off the syrup. Shake and drain until each piece is distinct and free from clinging drops. Roll in powdered sugar and spread out on platters or large plates to dry. Put in a place where the dust will not fly, and allow to remain several days. If

Boy is on hand to ask questions, help (?) and putter away at his own small concerns.

When the little ones can't be out on the porch, or in the shop, there is a box of special rainy-day toys and treasures which they enjoy in a corner of the kitchen. Children who are big enough can blow soap-bubbles, make scrap-books, and do other fascinating things. I try to look festive, wear a pretty dress and be as entertaining as if the family were guests.

Reviewing the Latest Eastern Markets and Prices

APPLE SHIPMENTS HEAVY

HERSCHEL H. JONES

APPLE shipments for the whole country to October 30, amounted to 62,910 carloads, compared with 55,185 to same date last year. The State of Washington is shipping at the rate of 400 to 600 carloads per day, compared with 150 to 300 cars a day from New York State.

The heavy shipments of boxed apples are depressing all the large markets. New York received as many as 79 carloads of boxed apples alone in one day last week. The general market is still dull, but for certain preferred varieties of barreled apples, looks a little more hopeful. Some of the accumulations of lower grades barreled apples have been cleaned up.

Hudson Valley sections are now packing late varieties such as Newtowns and Ben Davis and at some points packing will be over in another ten days.

In the week ending October 27, there were 139,578 barrels and 276,500 boxes of apples exported from New York port alone, compared with 30,199 barrels and 63,306 boxes in corresponding week last year.

New York City continues ahead of other large markets. Following are quotations for November 1 on barreled apples, A 2½ inch at New York: BALDWIN, \$3.75 to 4.50. GREENINGS, \$6 to 7.50. JONATHAN, \$3.50. KING, \$3.50 to 4.50. MCINTOSH, \$7.50 to 8.50. HUBBARDSTON, \$3 to 4. NORTHERN SPY, \$5.50 to 6.50. PEWAUKEE, \$2.75 to 3.25. SUTTON BEAUTY, \$3 to 3.50. SNOW, \$5.50 to 7.50. ROME BEAUTY, \$3 to 4. TWENTY OUNCE, \$4 to 5. STAYMAN, \$3 to 4. STARK, \$3 to 3.50. WAGNER, \$3 to 3.50. NONE SUCH, \$3 to 4.

POTATOES DULL

This was a week of heavy shipments from the northern potato producing sections and the large city markets throughout the country were generally over-supplied and prices in the buyer's favor. New York City was getting carlots of Long Islands as low as \$3.15 per sack 150 pounds f.o.b. loading point, bulk \$1.15 bushel loaded.

Maines came in for \$2.80 sack 150 pounds, bulk \$1.65 to \$1.75 per cwt. delivered. States arrived for \$2.60 sack of 150 pounds; bulk, \$1.60 to 1.70. Michigans were confirmed at \$2.50 sack of 150 pounds.

Due to heavy supplies in practically all the yards the dealers sold 180 pounds Maines for \$3.25 and States for \$3. Trading was light, buyers were holding off expecting lower prices.

CABBAGE MARKET QUIET

Best Danish cabbage medium size grocery stock sold for \$16 per ton f.o.b. shipping point.

For Domestic cabbage, large size, the buyers were offering \$11 ton f.o.b.; a few \$12. The kraut factories will probably finish cutting within a week and will be through buying for the season.

SHORTAGE OF BUTTER

There was an actual shortage of high grade butter on the New York market this week and dealers had to dole out supplies in small amounts to their customers. Prices in consequence moved up sharply and 93-94 score brought 50c per pound or better. Receipts of butter are below that of last year and the shortage has met an unusual demand. There were no receipts of foreign butter during the week.

CHEESE MARKET BETTER

A general feeling of weakness in the cheese markets accompanied by lower prices at the first of the week was followed by a little better tone and somewhat higher prices on November 1st. Lower markets were generally reported in Wisconsin and in Canada and England. State flats, well cured, which were sold at 26½ to 27c during the middle of the week, brought 27½c before the close.

CALF SUPPLIES HEAVY

Receipts of western calves were heavy this week but they could not meet competition of nearby stock and were

largely unsold after several days, although a few sold at prices ranging from \$4.50 to 7 per 100 pounds.

The market on country dressed veal was generally easy during the week. Lamb supplies were about equal to the demand but the market tended to drag somewhat at the close.

POULTRY DEMAND GOOD

In spite of large holdings of turkeys in storage warehouses the first fall arrivals are bringing good prices. Fancy turkeys brought as high as 60 cents per pound during the week. It is pointed

eggs still remain large and most buyers prefer to purchase storage eggs rather than take a chance on eggs held by the farmer or not graded.

GRADE YOUR EGGS

We have drawn attention again and again to the depressing effect that held eggs have had on the market this fall. In many cases it has been almost impossible to dispose of such eggs at any price and many complaints have been made against reliable dealers for fail-

"What Are They Worth To-day?"

MY dear Mr. Eastman, I cannot resist sitting down and writing you a few lines about the very unusual experience which I had yesterday.

My crop of ten acres of late Irish potatoes is just about ready to be harvested and sold; also my five acres of tomatoes. The question arose in my mind—what are potatoes and tomatoes worth to-day?

I remember reading in the American Agriculturist about your radio market reports. I went into the house and without any difficulty got WEAF on my radio. It was about 10:45 and I listened for a few minutes to Miss Mable Carney of Columbia University give a very excellent talk on the rural school situation. Then I heard Mr. Albrecht announce and read the American Agriculturist market reports. Mr. Eastman, I got a real thrill listening to those market reports.

In the first place, I learned what potatoes and tomatoes were sold for in New York that morning. This gave me an excellent idea what I should ask for my crop in my neighborhood. But besides this, I cannot get over the wonderful service which you are rendering by giving these daily market reports, and I feel sure that every farmer who has something to sell and has a radio receiving set, must be greatly indebted to the American Agriculturist for this remarkable reporting service.

Very truly yours,
Hiram Morgan.

out by operators that the general industrial conditions which are good may result in a larger demand this year than usual. Generally prices of 40 to 45c are expected by dealers during the season.

Heavy supplies of poultry during the past few weeks have met a good demand and have been absorbed readily. Express arrivals generally, however, were lighter during the past week and express colored fowls brought as high as 30 cents per pound.

PRICES CHECK EGG DEMAND

There is a feeling on the New York market that the high price of fancy eggs has checked demand to such an extent that prices will not go much higher. Wholesale prices of nearby extras closely selected were 82 to 84c per dozen on November 2. There have been unusually heavy receipts of such eggs lately in response to the very active demand.

Supplies of mixed and undergrade

ing to make immediate returns when the dealer was doing his utmost to sell the consignment.

There is an impression in the New York market that some shippers have deliberately mixed held eggs with their fresh collections. If this is so it is a mighty poor policy because instead of making the held stock worth more, it simply makes the fresh eggs worth less. Of course, at this season fresh gathered eggs coming into shippers' hands contain many stale, shrunken, farmer held goods and when these are a majority the shipments, unless assorted, are of the undesirable quality above specified.

MERRYMAN GUERNSEY SALE AVERAGES OVER \$448

L. McL. Merryman of Timonium, Md., writes that he held a most satisfactory sale of Guernseys during the last week of September. Seventy-two

Guernseys were placed on the block consisting of 6 bulls, 43 cows and 23 heifers. The bulls averaged \$792.50, with Langwater Guardsman topping at \$2,500. Langwater Guardsman was purchased by H. S. Haskill of Cossart, Pa. The cows averaged \$500.46. Langwater Paysanne topped the cow class with a bid of \$2,500, going to Emmadine Farms, Hopewell Junction, N. Y. Two other cows brought \$1,000. They were Cosquay's Golden Maggie purchased by A. S. Zell, Riderwood, Md., and Albamont Corydelis to Dorothy Calwalder of Wayne, Pa. The 23 head of heifers averaged \$270.20. Three of these went to Oscar Nevares of San Juan, Porto Rico. The bids were handled by George Bayne.

Farm Bureau—What It Is. What It Does

(Continued from page 317)

is all that is necessary. The aim of the county agent is not primarily to increase production but to help farmers to produce more economically. The agents also give farmers information on marketing and have furnished the facts which have assisted them in organizing many of their successful cooperative organizations.

"A system of agriculture which is profitable to the men who are engaged in it is absolutely essential not only to country people but to city people as well. If we are to maintain our present standards of American citizenship the prosperity of the city as well as the country must be assured by a permanent and profitable agriculture. The county agricultural agents and the farm bureaus are working toward this end, the service being available to those who care to use it.

"Like most service organizations, the amount of benefit you receive from the farm bureau depends on how much you put into it. The community in which the majority of farmers are actively working with the bureau is the one which gets the most benefit. The more you make use of the county agricultural agent the more you will value his services. When he does not have the information you desire he knows where to secure it for you."

What Is Wrong With the Cooperatives?

(Continued from page 321)

farmers more loyal than ever and that the discussion of the failures will help them to correct mistakes and make them more determined to see that less are made in the future.

These articles will include discussions of such problems as the salaries of officers, the kind of cooperative officers that should be elected, the problem of why the non-member gets more in many cases than the member, the problem of overhead expenses, politics in the cooperatives. What about the form of management, shall it be largely central control or local control? Shall the contract with members have teeth in it and shall it be for a long or short period? What about the problem of volume of business? Should the cooperatives advertise? These and other similar topics which should be intensely interesting to every farmer whether or not he believes in the cooperative movement.

"I have been a subscriber for a good many years to the American Agriculturist and enjoy reading it very much, and have gathered a good many valuable hints from its perusal. I simply could not get along without it."—Florence E. J. Deitz, Berne, N. Y.

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on November 2:

Eggs, Nearbys (cents per dozen)			
New Jersey hennery whites uncandled, extras...	82 to 84
Other-hennery whites, extras.....	82 to 84
Extra firsts.....	70 to 73	66 to 68	55
Firsts.....	63 to 69	49 to 50
Gathered, whites, first to extra firsts.....	63 to 71
Lower grades.....	45 to 62
Hennery browns, extras.....	63 to 65
Gathered browns and mixed colors, extras.....	50 to 62	56 to 58
Pullets No. 1.....	45 to 55
Butter (cents per pound)			
Creamery (salted) high score.....	51 to 51½	52 to 53
Extra (92 score).....	50½	50 to 51	50
State dairy (salted), finest.....	49 to 50	48 to 49
Good to prime.....	46 to 48	41 to 46
Hay and Straw, Large Bales (per ton)			
Timothy No. 2.....	26 to 28	17 to 18	\$26 to 26.50
Timothy No. 3.....	24 to 25	23 to 24
Timothy Sample.....	16 to 19
Fancy light clover mixed.....	28 to 29	27 to 27.50
Alfalfa, second cutting.....	32
Oat straw No. 1.....	11 to 12	16 to 16.50
Live Poultry, Express Lots (cents per lb.)			
Fowls, colored fancy, heavy.....	28 to 29	23 to 25	26 to 28
Fowls, leghorns and poor.....	20	18 to 20	17 to 20

Saving on Gas, Oil and Tires

And How To Keep the Car From Skidding

THE best way to keep down the gasoline consumption of your automobile is to sell it. Then, so far as you are concerned, expense for gasoline will cease. If, however, you are not willing to do this, the advice following may be of some benefit.

The miles per gallon of gasoline depend upon the car, the motor, the driver, the gasoline, and several other things. The most important factors which determine the amount of power required to move a car along are friction and wind resistance.

Every moving part of the car encounters friction as it functions—motor, transmission, propeller shaft, gears, rear axle, wheels, tires, and bearings.

The type of these parts mentioned you cannot change, but you can see that they are properly adjusted and lubricated. There are many cars now in use, the gasoline consumption of which could be very much reduced by using lighter-bodied lubricants. You will avoid friction by using lubricants as thin as can be done and yet adequately protect the bearings. Before changing lubricants, clean out thoroughly all old oil and grease from working parts.

Do not neglect the brake and transmission bands. These should be absolutely clear of their contact surfaces so that road shocks will not disarrange their positions and permit them to touch or drag when their retarding power is not needed. Experts also insist that tires be inflated to capacity.

Wind resistance is also an important item in the mileage made with a car. Little can be done to reduce this without the sacrifice of comfort, but when driving can be done with the top down and the windshield open, the consumption of gasoline can be materially reduced. When the top is up, it acts as a huge scoop, pocketing the wind.

Avoid Engine Leaks

It is hardly necessary to say that the motor should be in perfect condition. The most important factor in the operation of motors is compression. This can be tested by using the hand crank and rocking on the compression of cylinders, one at a time. If the compression is good, as it should be, the compressed air cushion at the top of the cylinder should be maintained almost indefinitely. This means that the air can be compressed by turning the crank a little way and then allowing it to expand again, when the pressure is taken off the crank, and this rocking process repeated without any apparent change in resistance for several minutes. Almost always, unless cars have been used a great while, trouble comes from leaky valves, and may be remedied by grinding, if pitted, or by replacement if badly scarred or warped.

Spark plug and pet cocks are a source of small compression leaks, which may be readily detected by squirting oil around the threads while the motor is in operation. Where there is air escaping, small bubbles will be seen.

In regard to the carburetor, it is taken for granted that the adjustment must be the best obtainable. Usually the carburetor is adjusted as lean as possible and yet so the motor will pull with the throttle wide open at speeds between four and six miles and twenty-five to thirty miles per hour.

Gasoline will also be saved by coasting wherever this is possible, stopping the motor and disengaging the gears on long "glides."—P. T. HINES.

GOOD OIL IS CHEAPEST

Many a man has been surprised to be told that he saws his whiskers off. Yet this is exactly what he does when he shaves. Examination of the edge of a well-sharpened razor blade under the microscope shows not a smooth edge as was once supposed, but a series of more or less regular teeth. This saw-tooth edge is the junction between the two surfaces of the blade and cannot be avoided.

If this is the condition on a highly-polished razor blade, what enormous

hills and valleys must one expect to find on the surface of the ordinary polished bearings used in machinery and motors. These rough surfaces, rubbing together, produce friction which reduces the efficiency of any machine. Roller or ball bearings overcome friction to a considerable extent, but there are places where they cannot be used.

In these cases oil takes their place. Oil actually works very much like ball bearings, the two sliding surfaces rolling over little globules of oil. Just as in the case of ball bearings, the little globules of oil finally become so chipped that they no longer roll easily. When this time comes it must be renewed. Oil that has become black from use retains but a very small percentage of lubricating qualities.

The best grades of oil are most resistant to the destructive agents—heat, friction and wear. These three cause oil to deteriorate. For most uses a cheap oil is in the end more costly than a good grade of oil. Even the best grade must be occasionally replaced. It never pays to use a poor grade of oil for any purpose whatever.—W. E. F.

OILS AND GREASE DESTROY RUBBER

Many a good tire has gone on an untimely trip to the junk pile simply because the owner of the car to which it has been attached did not know that gasoline, oil and grease are the natural enemies of rubber. They will cause the best tires to decay and disintegrate rapidly.

Very often cars throwing grease from the rear axle, covering the inner side of the wheel and tire with black grease. This is due to the fact that the packing washer in the drum of the wheel has worn out and the grease from the bearings is passing into the drum. The centrifugal action caused by the wheels turning tends to throw it out, thus covering the wheel. The grease that covers the tire in this way is very detrimental to the rubber. It is not long before the inner side of the casing becomes badly rotted. Naturally this results in early destruction of the casing. As soon as grease is observed on the tire, it is a matter of saving money to have the packing inside the wheel renewed. Otherwise it would soon mean a new pair of rear tires.

AVOIDING TIRE LOSSES

E. D. HENRY

A great many farm trucks are equipped with the older type fabric pneumatic tire, hence the owner can diagnose the trouble when one fails prematurely is in position to save himself money. He can also avoid the loss certain to follow when an unscrupulous repairman advises the repair of a tire that is too badly injured or has not enough wear left in it to justify the cost of repairs.

Careful and frequent inspection of tires for cuts and injuries will add many miles to their useful lives, though there are some injuries such as stone bruises or other injuries to the fabric that no external examination will discover, therefore whenever a tire is taken off for any cause it is a good plan to inspect its interior for weak or damaged spots. When a tire has given a comfortable mileage and is still apparently good for many more, it is a good plan to take it off and examine its interior. Quite frequently the fabric will show evidence of hard wear and then the installation of a reliner will give the added mileage you had expected from the appearance of the tire's outside and which you would not have gotten otherwise.

Rim-cutting, a common cause of failure, is not always caused by running the tire flat or partly inflated as many suppose, nor is this trouble always easy to detect. It is seldom found in straight side or the larger size QD tires, but the Ford sizes and up to 31 x 4 clinchers very easily rim-cut. Nor is rim-cutting always the fault of the driver. A clincher tire kept properly inflated on a perfect-fitting

rim will not rim-cut, but one of the chief causes of rim-cutting is bent rims. Once we know that a clincher rim bent only 1/64 of an inch will cause a tire rim-cut even if kept properly inflated, we can readily understand that where rim-cutting exists the rim should be examined and if it requires it, carefully straightened before another tire is put on. Sometimes a tire will appear rim-cut when it is not. It may be only the chafing strip is injured or has loosened. This strip is to protect the body of the tire from chafing, though some tires do not have it.

Sometimes lumps or boils appear on a tire, and these should be opened at a point farthest from the tread or as far up the side of the tire as possible. If they contain sand, it indicates a hole in the tread somewhere where the sand worked through. This hole should be located, the sand removed, and both holes then carefully sealed shut with cement and tire putty. Should the boil be filled with pulverized rubber it is an indication that the tire is defective or has been run under-inflated for some time. If there is only one boil or blister, it should be treated as advised for a sand blister. If the blisters appear quite general all over the tire, usually it is foolish to attempt repairs. Blisters may also indicate either tread or fabric separation, and when this occurs, as a rule that tire is past profitable repair.

Injuries to the inside of a tire are, as a rule, plainly apparent on inspection. The fabric will be seen to have a roughened or broken appearance. Breaks confined to one spot or section can frequently be repaired profitably, but where the breaks show up in a number of places or are distributed quite generally around the tire as in rim-cutting, the tire had better be discarded.

It pays the tire owner to know when it will pay him to have a tire repaired and not leave it to the repairman, whose judgment may be warped by his desire for a job.

HOW TO KEEP THE AUTO FROM SKIDDING

W. E. FARVER

Recently an acquaintance of mine was killed nearby, by his car skidding, turning turtle and pinning him fast underneath. This dreadful accident leads me to offer a few hints on how to prevent skidding.

If the driver always knew when a car was going to skid he could prevent all skidding. Skidding is such a sudden occurrence that unless the driver does mighty quick thinking and some acting automatically, there will be little done to prevent it in most cases. This means being prepared for any emergency by knowing what is best to do.

The first thing any driver can do to prevent skidding is to drive *SLOWLY* when on wet, slippery roads or on slippery and icy pavements and improved roads. It is well to stay out of tight places or to drive close to other cars where the brakes may be needed to stop or the steering apparatus used to make a quick turn. Either of these induce skidding.

When signs of skidding are noticed the first thing to do is to release the clutch immediately. This done, the car often rights itself. Brakes should be applied only when the car is in a straight position. When releasing the clutch, steer the front of car in the same direction as rear of the car is skidding. This procedure helps to attain a straight course and aids in applying the brakes with safety, often preventing a serious accident. A few principles of safety applied properly will prevent many serious accidents.

Thanking you for your published article of information in regard to posting farm land, also for your very liberal offer of furnishing the signs and your cooperation in the whole matter. Best wishes to the American Agriculturist.—FRED HANNON, Tioga County, N. Y.

How Would You Cure This Team?

Would you whip them—would you kick and beat them? Just what one thing would you do to make sure they'd never do it again? At last there is an amazing new way to train horses which shows you exactly how to handle any horse, exactly how to break him of any fault—easily and quickly. **FREE to FARMERS** And now this special Introductory Course in Practical Horse Training will be sent absolutely FREE to any farmer or breeder. Tells all about the wonderful new principles discovered by Jesse Beery, the famous horse trainer. Fully illustrated and brimful of interesting pointers. Many earn big money breaking colts for friends. Remember—this book is absolutely FREE. Mail post-card NOW! **BEERY SCHOOL OF HORSEMANSHIP, Dept. 1611 Pleasant Hill, O.**

GREEN 2-WAY STANCHIONS
Litter and Feed Carriers, Water Bowls, etc., just naturally increase your earnings. Don't wait until building or remodeling. Put in our Equipment. **START NOW!** A guaranteed line sold at low factory prices. Send for literature today and save money on your requirements.

AMERICAN AGRICULTURIST

Founded 1842

NOVEMBER 17, 1923

"Heads I Win, Tails You Lose"

How the Standard Food and Fur Association, Inc., Buys Back Rabbits

THE National Vigilance Committee, which the Associated Advertising Clubs of the World maintains to detect fraudulent advertising, and its affiliated Better Business Bureaus have cooperated with the American Agriculturist in investigating this and other companies.

Many of our readers are familiar with the business of this organization, which has been publishing advertisements similar to that appearing on page 344.

When a subscriber writes for the books he gets further information in the form of a pamphlet entitled "Dollars in Hares." This pamphlet paints a glowing picture of the profits that can be made by raising rabbits and tells the reader that the Standard Food & Fur Association, Inc. believes itself to be "The world's distributor of domestic hares." The advertisement quoted above tells you that the company will "buy all you raise at \$7 to \$25 per pair." The booklet tells you that it is possible "for a good doe to raise 42 young (21 pairs) in a year" and then describes how at \$18.50 a pair, the income of that number would be \$488.50. This looks like pretty good profit from an investment of a few dollars for the original pair which you would buy and, as the pamphlet itself frankly says: "this sounds too good to be true" and it points out that this can only be done by an experienced breeder. But the statement follows that "it is not at all difficult to raise four litters of six each in a year and that makes 24 youngsters or 12 pairs." At \$25 a pair the gross income from a good doe breeding at this rate would be \$300, according to the pamphlet.

Now, you naturally think that when the advertisement quoted above says "we buy all you raise at \$7 to \$25 per pair" that you will get this money. The company also agrees to pay the express charges. When you investigate the contract, however, you find that the company obligates itself to purchase back the rabbits "when six to eight months old, according to breed, purchased from us, and to be in good health, smooth-coated and in good condition."

In its pamphlet the company says "there are no trick clauses in our simple contract, no requirements which cannot easily be met. We live up to the contract in every respect. We must, because we are an old-established concern, financially responsible, and can only remain in business by treating our customers fairly." Now that sounds pretty fair, doesn't it? Let's see how this actually works out. Per-

haps you know from your own experience. Let us see if there are no trick clauses. Many of our readers complain that when they attempt to ship back rabbits to the company the company instructs the shipper to prepay the express charges and promises to refund, and we note that the shipping instructions furnished by the company say: "Kindly prepay the expressage and we will reimburse you upon presentation of express receipt showing amount paid out by you."

We have seen many complaints which show great difficulty experienced in getting the company to repay these express charges and in various cases the company has refused to repay for one reason or another. We have also seen complaints in various cases where the company refused to buy back the rabbits and it, apparently, uses two stock alibis: the rabbits are under weight, or have become dirty en route. In one case, it says that the rabbits are not of the stock sold, although the purchaser says that they were bred from the rabbits which he bought from the company. The company advertises full-blooded stock for sale, which should, of course, breed full blooded, if the description means anything.

It will be interesting to examine a few of the stories from persons who have actually bought from this company.

A gentleman from Arkansas writes that he paid the company \$22 for a pair of rabbits after he had seen their advertisement and after the company had written "continually even urging me to borrow money to get them with." He points out that the company was very prompt in writing to him before he paid his money. Read the balance of his story as he himself writes it.

On December 23, I wrote to them that I had four pairs of rabbits to ship, all of the same litter and to please send me shipping instructions. I waited almost two weeks and got no reply—so I wrote again and after waiting two weeks longer without result, I thought it strange—they had always been so prompt in answering me. I was determined to get an answer so I sent a registered letter and got an immediate reply.

"They told me to ship my rabbits and pay expressage, as they had no funds at shipping point to pay for express, and as I had the contract, I supposed, of course, that they would refund the money.

(Continued on page 344)

To the Readers of the American Agriculturist

IN accordance with our long-established policy of protecting the farmers, we are going to give our readers some "facts" in regard to certain individuals and firms doing business with farmers. We feel it our duty to bring to the attention of our readers full details of all cases, in which we believe improper practices have been employed. In addition, we propose to go one step further and will turn over to the proper authorities, certain information which we have, so that these authorities may take such criminal or other action as they deem suitable.

Our readers are already familiar with what we are doing in our Service Bureau, and this feature is merely the outgrowth of the efficient working of that Bureau. We invite our readers to write us fully in regard to any complaints which they have, or for any information they wish on these subjects.

They have more than strength

How an added quality gives "U. S." Boots longer wear

Rugged strength—that's what most farmers look for when they buy boots. Strength to stand kicking around the barnyard—tramping over rough ground—through ice and slush.

"U. S." Boots are built strong. But they've got something *more* than strength.

Into every "U. S." Boot is put one of the *most elastic rubber compounds ever used in boot construction.*

Cut a strip of rubber from a "U. S." Boot—and you'd find it would stretch more than five times its length without breaking!

The tough fabric reinforcements of "U. S." Boots are anchored in solid rubber as *live as an elastic band.*

That's why "U. S." Boots have unusual *flexibility* as well as strength. That's why they stand constant strains without cracking or breaking. That's why bending and

flexing thousands of times each day leave them tough and resisting. And that's why thousands of farmers in every section of the country are turning to "U. S." today.

Be sure to ask for "U. S." *It will pay you to get the longest wear a boot can give you.*

Other "U. S." Footwear built for long, hard service

You'll find every type of rubber footwear in the big "U. S." line. There's the "U. S." Walrus, the famous all-rubber overshoe—the "U. S." Bootee, a lace rubber work-shoe for spring and fall—"U. S." Arctics and Rubbers—all styles and sizes for the whole family. Look for the "U. S." trademark whenever you buy—the honor mark of the largest rubber organization in the world.

THE INSTEP—*A boot has no lacing in front, like a shoe, to give as you walk. Every mile you go, the rubber bends and buckles 900 times. We've put a series of graduated reinforcing layers into the instep, combining unusual flexibility with surprising strength.*

A strip of rubber cut from a "U. S." Boot stretches more than 5 times its length without breaking—and snaps back into shape like an elastic band. This live, elastic rubber is one of the reasons for the unusual flexibility and long wear of "U. S." Boots.

"A Woman's Home Is Her Castle"

But She No Longer Puts a Thousand Blocks In a Quilt—A Radio Talk

A WOMAN'S home used to be her castle, but to-day since the search lights of Home Economics have been turned on the home, the family purse has been opened and the money counted and budgeted, the cupboard has been ransacked and the food analyzed, and even the family skeleton has been dragged out of the closet. All this the home has stood with very good grace because women are eager to get into line and make their vocation of home making into a real profession.

In great grandmother's time cookery was an art. Its accomplishment was expected to take much time and diligent application. A long experience brought perfection in results. Kitchens were presided over by culinary geniuses. To-day we are obliged to find some quicker method than the long apprenticeship for handing down the art of cookery which we have inherited from the past, and we are trying to analyze the old recipes in such a way that we may be able to write explicit and definite directions so that even the inexperienced woman may get good results the first time she follows them.

We are hoping to get as good a cake as great grandmother's, but we trust it will not take so long for granddaughter to learn how to make it as it did in the old days. For now that economic conditions have greatly changed, standards for women's work in the home are also changing. A woman is no longer judged by her willingness to beat a cake two hours to obtain a good texture or by her ability to piece a quilt in thousands of blocks.

Being a good housekeeper to-day is harder than in the days of the lady who sewed a fine seam. Few women are content to be backward and useless members of a community and prefer to spend time learning how to perform their housekeeping duties as scientifically as possible.

To be sure some women in striving for efficiency have developed so much machinery that the soul of the home has been buried under all its mechanism. They have failed to realize that efficiency in housekeeping is not merely time saving, but time saving to be directed toward some definite worth-while end, such as bettering the living conditions of the community as well as of their individual homes. The really efficient housewife is studying not only how to minister to the needs of a growing family, but also how to find time for intellectual life in order to keep up with the children. She must also take time to learn how to perform her civic duties intelligently. With such numerous demands on her time a two-hour beating of a cake batter is impossible.

A large part of every woman's time in the

By MAY B. VAN ARSDALE

*Professor of Household Arts, Teachers College,
Columbia University*

home must be devoted to feeding not only the bodies but the souls of those under her care. We are getting much tangible information lately on feeding the body and in all the better homes of this country to-day women are studying the food needs of their families with the idea of discovering just how to get the most for the dollar.

Housekeepers are not artfully persuading

and personality. Can she find any task more worthy of her talents? In proportion as she succeeds will her home truly fulfill its spiritual possibilities. For in the last analysis, the real difference between a house and a home is "atmosphere."

We are just beginning to learn what "bread" really is, and we are getting started on analyzing our expenditures of energy for labor which "satisfyeth not." We have time, money, and energy to spend. In planning our housework why not think how much time it will cost, as well as how much it will de-

plete the family purse? In schools where the Household Arts are being scientifically studied, investigations of meal getting have shown that much extra time can be spent on processes which do not add materially to the satisfaction or to the happiness of the family. Much of our pleasure in eating comes from aesthetic touches—and they are decidedly worth while—if they do not conceal poor cookery; because a dinner should not be beautiful at the expense of being good to eat. Wouldn't it be better to put most of the time into making plain food as palatable as possible?

For many years the Farm Bureaus and the Agricultural Colleges have been helping the farmer to grow more and better produce. The farmer has been willing to invest large sums of money because he could see a tangible return in better farms for his investment. In all other lines of business, improved methods of work have been introduced to yield better results.

The home has not kept up with this progress and has not radically changed in the last fifty years. If Benjamin Franklin should come back to a newspaper office to-day he would have to learn how to use many new devices. But if his wife should walk into the kitchen of one of her descendants she would have little difficulty in preparing a meal. Why are we so slow about making changes in our own kitchens? Isn't it reasonable to expect that more effort will be made to have efficient kitchens equipped with labor-saving devices? Why not a better home on every better farm? Why wear the latest fashions in clothes while still carrying on antiquated housekeeping?

Better knowledge of marketing conditions on the part of the housewife is making for more intelligent and therefore better homes.

To-day even the woman in a large city, chiefly concerned with the consumption of food is altruistic enough to appreciate that the problems of the producer have a very intimate bearing on the purchasing power of her own dollar. She can sympathize with

(Continued on page 345)

More Work In Less Time

THE men folks have been able to stay in the farm business only by constant study in applying machinery and devices to do the work that was once done by hand when labor was plentiful and cheap. But the labor problem is just as acute in the home, and for some reason, perhaps because all of the money was used to buy farm machinery first, improvements in the farm home came slowly. Unfortunately, there is some truth in the old saying that:

"Man works from sun to sun
While woman's work is never done."

In grandma's time, there was much to do, but there was also more help to do it and more time to do it in. Modern times have brought more demands on woman's time and given her more opportunities. Some way must be found, therefore, to so conserve her time that she can better meet her opportunities.

Professor Van Arsdale tells in her exceedingly interesting article on this page what the modern woman is doing to meet the changing conditions and demands in the great profession of home-making. Professor Van Arsdale's address was broadcast from WEAf on Wednesday evening, November 14, at 7:50 P. M.

Are you tuning in to WEAf every Wednesday evening to hear American Agriculturist farm radio program?—The Editors.

their families to empty their purses for food. But they do want them to get from their meals not only nutritive values, but the pleasure, social enjoyment, and relaxation which can come only if the setting is provided. Personal touches take time and thought and create an atmosphere which makes the simplest meal seem a real function.

Dinner is often the one meal when all the members of the family come together—the first time during the day when they can all take time for sociability. A leisurely dinner usually requires about an hour. Are there any other seven hours during the week when the family can get better acquainted? If not, this makes the getting of dinner one of the most important of the day's duties. Does it not justify a little extra time spent in planning and preparation? Simple appetizing food well cooked and served in a real "atmosphere" means energy well expended.

In many homes, where a moderate income must cover many things, the budget for meals may not permit expenditures beyond those for actual foods. The housewife is then met by a real problem. She must supply the pleasurable aspects of her dining room by using the best of her imagination, genius

VOL. 112 November 17, 1923 20

Wolf! Wolf!

ONCE upon a time, according to Aesop, a small boy was sent to guard sheep. Guarding sheep is dull work, and he soon began to look around for some way of stirring up excitement, so he rushed across the lot to some men working nearby and cried: "Wolf! Wolf!" When the men came running, they found there was no wolf, and went away exceedingly angry.

After a time, the boy again cried: "Wolf! Wolf!" and again the men came and found no wolf, and went away exceedingly angry.

Then the wolf really did come, and when the boy ran screaming for help, and crying: "Wolf! Wolf!" the men only laughed and said: "He fooled us twice but he cannot do it again."

In reading many of the articles that are constantly appearing on the Rural School Bill, we have been reminded of the boy who cried: "Wolf! Wolf!" Farmers have been told in screaming headlines clear across the page, that if this bill passes, it means consolidation of all of the rural schools—"Wolf! Wolf!"

They have been told that they must come running to save their little red schoolhouse—"Wolf! Wolf!"

They are told that if this bill becomes a law it will take all of the control of their schools away from them—"Wolf! Wolf!"

They are told especially to watch out for their own officers in the farm organizations whom they themselves have elected, to see that these representatives do not put something over on them. "Wolf! Wolf! Wolf! Wolf!"

There has not been an issue up in many years on which there has been more opportunity, if one has no regard for facts, to create prejudice and misunderstanding than the discussion of this Rural School Bill has given; and there have been those who made the most of this opportunity. Exactly the same methods were used in every great movement of the people in the history of this country. Read the history of the Revolution and see what the colonists had to

overcome—not only with the British, but with those among themselves who insisted upon crying, "Wolf! Wolf!"

Remember those of Civil War times here in the North, who cried: "Wolf! Wolf!" at everything that Lincoln's government tried to do. And in our own times, we have no difficulty in recalling those who have constantly cried: "Wolf! Wolf!" when farmers have tried to do business together through cooperation.

Fortunately, however, it is true, as Lincoln said: "You can fool some of the people all of the time; you can fool all of the people some of the time; but you cannot fool all of the people all of the time." So while those who cry "Wolf! Wolf!" may succeed for a time, they never do permanently.

It may be that the proposed School Bill is not what the folks of New York want. Undoubtedly, there are parts of it that time and use will show the need of revision. But it is of too far-reaching importance to let the red herring of sensationalism be drawn across the path of its true understanding and significance. And in any case, we know that the great majority will base their final decision not on the loud noise made by those who cry: "Wolf! Wolf!" but rather upon their own good judgment, which is arrived at after a careful and fair study of the facts.

What is the Matter with Cooperation?

ON the opposite page is the beginning of the best series of articles that has yet been written on the cooperative movement. These articles are so full of human nature that they are jam full of laughs from beginning to end. But under the humor there is a real purpose which will not be clear until you have read the whole series, so if you read the first one, will you be sure to read them all?

Alternating with these articles by the "Silent Director" will be another series on organization which we will write discussing the successes and failures of cooperation. The first one appeared as a feature in our November 10 issue. Did you see it?

These two series of articles discussing not only the successes, but also the failures of the farm organizations, will, we predict, cause a tremendous amount of discussion and renew the constructive interest of farmers in their efforts to do business together.

The Backbone of Organization

FARMERS of the East who have sacrificed, suffered and endured the hard times of recent years may not be able to see how the situation could have been any worse, yet had they lived in any other section of the country, we think they would have been glad enough to have moved back to New York or other sections of the East; for it is generally agreed that the eastern farmers suffered the least.

We believe that one reason for this is, that they were better able because of organization to meet the test. The backbone of farmers' organizations in Eastern United States, and particularly in New York State, is the Farm Bureau. Beginning with the Dairymen's League, and continuing down through nearly every one of the many commodity organizations which the farmers now have, we find back of them, constantly supporting them, and many times actually founding them, the Farm Bureau. The greatest weapon in any great fight for the right is facts, and the Farm Bureau is a fact organization. Not only has it been a tremendous service in helping farmers to better markets through organization, but it has done much to help cut down the costs of production and increase the quality of farm

products. Probably the chief reason why the Farm Bureau has been so effective in this section is the fact that the farmers themselves through their own county and local organizations have had a large part in the control and direction of its affairs.

These county organizations are now making an effort to renew their old membership and to add new members for the coming year, and it is to be hoped that their efforts will be successful.

We Are Going After Them

NEVER in the history of America has there been so much cheating, chicanery and actual robbery in the business world as there is right now.

Never has there been so much money lost from frauds of every kind and description as now. Every community in both country and city has several, sometimes hundreds of dupes whose lifetime savings have been swept away in foolish and fraudulent investments. Every country community is constantly shipping eggs and other products to fly-by-night dealers who are not registered with the State Departments, have no financial standing, and who have nothing to recommend them. All of these rascals are long on promises and short on execution. Every day brings forth new schemes and new flocks of scoundrels, practically all of whom make money and escape prosecution.

Every mail brings heartrending letters to our Protective Service Bureau asking for help. Often no help can be given, because it is a case of locking the door after the horse is stolen.

Postmaster General New told the Investment Bankers' Association a few days ago that over a million gullible Americans lose over a billion dollars in money and property in mail frauds.

American Agriculturist, as well as other farm papers, has warned and warned, and warned our people To Watch Out, but still the slaughter goes on, still the letters come, begging piteously for help to regain lost savings.

Now American Agriculturist has concluded that talk does no good. It is time for action. Read Henry Morgenthau, Jr.'s article on the first page of this issue.

Eastman's Chestnuts

THE trouble which farmers constantly have with auto thieves will make them especially appreciate the following story. We are indebted for it to that genial, successful and livewire county agent, Mr. T. W. Vann, of Penn Yan. The farmer in the story lives in western New York and is very well known throughout the whole State.

It seems that this farmer was working around the house when he spied a gasoline truck stopping down the road by his apple orchard. The driver jumped down with a basket, climbed over the fence and began to pick apples.

The farmer ran into the woodshed, grabbed a five-gallon oil can, sneaked down the roadside, and before the driver saw him, hung the can under the gasoline spout and turned on the gas. Just about that time the driver happened to look around and saw what was going on.

"What are you doing there?" he shouted, starting for the farmer.

The farmer said: "I'm doing just the same thing that you are."

Whereupon the driver dropped his apples, climbed upon his truck and with a very red face drove away.

Mr. Vann suggests that if the thieves happen to be in a automobile instead of a truck, perhaps a spare tire would come in just as handy as a little gasoline.

Is Cooperative Marketing Here to Stay?

The Mythical Meetings of a Mythical Board of a Mythical Cooperative

WE want to ask a favor. Will you kindly not read the remarkable article written in dramatic form on this page unless you promise yourself and us that you will read the whole series which is to follow?

You will find these articles different and better in many ways than one, from any yet written on cooperation. In the first place, they are exceedingly readable and very amusing. They are an accurate and laughable interpretation of human nature. In the second place, they point out some of the cooperative troubles without being destructive. If the full series of articles is well read, it will in our opinion do more to boost the cooperative movement than anything that has been written yet. If you only read the first one or two, you will get an entirely wrong impression of what the authors have in mind.

We might say that the authors of this series are two of the best known friends of cooperation in eastern United States. Both of them actually hold very responsible positions in cooperative work. Maybe sometime we will tell you who they are. In the meantime, watch for the account of the next meeting of the directors and note the gradual improvement and evolution as farmers learn how to work and do business together.—The Editors.

Act 1—THE FIRST MEETING OF THE NEW BOARD

THE room is filled with tobacco smoke, littered with ashes and bits of paper. An area around the cuspidor indicates where a tobacco-chewing director missed his mark. Two directors are asleep. The general manager is holding forth.

General Manager: Gentlemen, the Ford used by the assistant sales manager has a punctured rear tire. I recommend that he be authorized to purchase a new tire.

The Lean Director: How many miles has he run the tire now on the car?

General Manager: I don't know but I will find out if you want me to.

The Director Who Doesn't Smoke: What make was it?

The Businesslike Director: Why bother with a detail like this? I move that he be authorized to purchase a new tire.

The Fat Director—who has apparently been asleep, drops his chair down on all four legs and asks the president to repeat the question.

The President: There is no question before the house. Does anybody wish to second Mr. Roberts' motion?

The Hurried Director: I second it.

The President: The question is that Mr. Jarvis, assistant sales manager, be authorized to purchase a new Ford tire. The question is now before you for discussion.

The Director Who Doesn't Smoke: We better specify the make.

"Me-too" Director: I think so too.

The Lean Director: I believe we are going too fast, gentlemen. I would like to amend Mr. Roberts' motion. I move that it be amended to read that Mr. Jarvis be authorized to purchase a new tube.

Silence. The Lean Director nudges the man nearest him. He seconds the amendment.

President: You have all heard the amendment. All in favor say "Aye."

Three Directors say "Aye."

President: Do you understand the question? Let's have a real vote.

Five Directors say "Aye."

President: The ayes have it. All in favor of the question as amended say "Aye." The ayes have it.

By THE SILENT DIRECTOR

General Manager: I now would like to present for your consideration the matter of raising a quarter of a million dollars by bond issue or otherwise for the purchase of refrigerator cars.

The Fat Director: I move that the matter of the purchase of refrigerator cars and ways and means be left to the general manager with power to act.

The Hurried Director: I second the motion.

President: You have heard the question. All in favor say "Aye."

Eight ayes.

The Hurried Director, rising: My train goes at 4:15. I will have to be excused.

President to General Manager: Have you any more business to bring to our attention?

General Manager to Stenographer: Have we covered everything?

Stenographer, looking at the clock: Yes, we have.

General Manager: Apparently the labors of the day are finished.

President: I will entertain a motion for adjournment.

No motion is made, but all the directors arise. Some pick up their papers and put them in their pockets. Others visit for a few moments. Finally there is left in the room the Nervous Director and the General Manager.

Nervous Director: Is cooperative marketing here to stay?

General Manager: Who knows. I don't. (To be Continued)

The Cast of Characters

The Fat Director—Tells stories, reports executive sessions

The Lean Director—Suspicious and parsimonious; strong for executive sessions

The Director Who Doesn't Smoke—Grouchy; seconds motions

The Hurried Director—Careless and restless; makes motions

The Judicial Director

The Director Who Plays Politics—Always whispering in the corner

The Silent Director

The Always Absent Director

The Nervous Director—Secretary

The "Me-too" Director

The Businesslike Director—Treasurer; analytical; constructive

The Director Who Doesn't Count—In over his head

The General Manager—Nervous, aggressive, keen, very prone to quick decisions

The Attorney—Founded on precedent

The Stenographer—Young and pretty and efficient

Time: January, 1923

Place: Office of the General Manager

Putting Eggs Into One Basket

A. H. DE GRAFF

WE are often told not to put all our eggs into one basket in our farming operations. The cotton

growers in the South have been lectured for years because of their habit of raising all the cotton the traffic would bear. Recently the town of Augusta, Ga., raised a monument to the Boll Weevil, because it had forced the southern farmer to diversify.

Is this advice not to put all your eggs into one basket sound advice or not? Certainly the business man does not do well when he splits up his effort among several lines of business. The writer knew personally one of the pioneer department store men of the country, one who had a mammoth store in Chicago and one in New York. He went into numerous other lines of business, and he never made a cent on any of them. On the contrary he sunk tens of thousands if not hundreds of thousands of dollars in them, and he was a shrewd man who did not bite on sucker bait, but actually went into these lines himself.

About fifteen years ago, some of the students of agriculture became possessed of the idea that the best method of studying farm management was to study farms, find out what systems were in use, sort them according to income, size, crop yields, degree of diversification, etc. They thought that perhaps by this means they could learn a lot more than they could to sit down and deduce what ought to be the best method of farming, and then try this out. The plan was carried out in a number of so-called agricultural surveys, and a lot of interesting things were learned. The one which we will treat of here is diversification.

The Intermediate Bank

The Third Type of Federal Credit For Farmers

This is the concluding article on Federal credit facilities for the farmer, written by Jared Van Wagenen, Jr. Last week he discussed the Federal Land Bank and the Joint Stock Land Bank. In the following paragraph Mr. Van Wagenen discusses the features of the Federal Intermediate Credit Bank. Be sure to save these articles for future reference, for they contain valuable information relative to the features of the various banks, written in Mr. Van Wagenen's characteristic style.

ONLY last spring, April 1923, Congress still intent upon giving the farmers further credit facilities, authorized the Federal Intermediate Credit Banks. There are twelve of these institutions, located in the same cities as

J. VAN WAGENEN, JR.

the Federal Land Banks and very closely related to them, although their affairs are supposed to be absolutely distinct. Each one of these institutions has a capital stock of \$5,000,000, which is subscribed by the Secretary of the Treasury, so that it might be said that they are strictly Government institutions. Their function, in the language of the law, is to furnish credit facilities "for any agricultural purpose or for raising, breeding, fattening and marketing of live stock"—a fairly liberal intention of function. Just what constitutes an "agricultural purpose" will probably be determined by the rulings of the Federal Farm Loan Board. Such loans shall be for a period of not less than six months or more than three years.

The Federal Intermediate Credit Banks are not designed to loan directly to the individual farmer. As a matter of fact, it would be wholly impossible for them to know anything about either the character of a loan or the worthiness or responsibility of a borrower hundreds of miles away.

Loans Through Local Banks

What they are organized to do is to "rediscount" the agricultural loans of any National bank, State bank, trust company, incorporated live stock loan company, or incorporated cooperative agricultural organization. These institutions are essentially local and it is their duty to investigate the loan and the security offered and to become responsible for its collection. It does not seem likely that just at present there will be any very extensive field here in the East for the Intermediate Credit Banks.

The cattle country has long had the habit of borrowing money for carrying feeding cattle and it is probable that in these sections, the plan may be used. In distinctly perishable products, a six months' loan is not needed—or at least the security offered would hardly be satisfactory.

I see no reason why our wool pools cannot come in under the system and it is also sure that purebred cattle might be distributed on farms under this phase if some local bank or incorporated agricultural organization will act as the local agency. The whole movement is still so new that policies and procedure is not yet fully determined, but I understand it to be the expectation that loans will be made up to 75 per cent of the appraised value of cattle carried under this plan.

Loans Direct to Cooperatives

Direct loans may be made "to any cooperative association organized under the laws of any State and composed of persons engaged in producing or marketing staple agricultural products or live stock if the notes or other such obligations representing such loans are secured by warehouse receipts or by shipping documents covering such products." It is also provided that no loan shall exceed "75 per cent of the market value of the products, covered by such warehouse receipts." It might be noted in passing that this is a very liberal

loan limit and one where the margin of safety could easily be wiped out by a falling market.

The whole Agricultural Credits Act, signed by the President on March 4, 1923, is a long and weighty document of 228 paragraphs and it will, to some extent, have to be interpreted by the rulings of the Federal Loan Board.

There are not lacking some thoughtful men who insist that making it easy for a man to get in debt is not the best way to help him in the long run. I am not going to express an opinion on this particular phase of the subject, but I do feel that this ponderous Act covering the three types of banks, established for the purpose of affording credit facilities to farmers is at least proof of the fact that the Government wishes the farmers well and has not been careless of his welfare. Perhaps it is not too much to say that Congress has tried to give us some special help such as it has not offered any other class.

BANK A CONVENIENCE AND A HELP

I would like to say that I have found the bank very convenient and a great help in many ways. I am only an ordinary farmer who started out in life as a hired man, my only assets consisting of a few work clothes.

Our little town bank was organized about fifteen years ago, about the time I began farming. Like many others I needed money. About my first visit to the bank was for a loan, and the cashier, a new man in our town, had to call one of the directors to see if I were financially sound. I heard him answer that the cashier was to let me have what I needed and if I didn't pay, he would be responsible.

Since then I have passed several thousands of dollars through this bank, and I am glad to say that our relations have been very pleasant, convenient and profitable as far as I have been concerned.

I seldom have much cash at hand and pay nearly all my bills by check. This gives me a receipt and sometimes saves me from paying bills a second time. It also gives me a record to show me where my money has gone. I also go farther by this method, for I believe a person will be a little more conservative when making a contract if he has to stop to write a check.

I believe that the farmer whose credit is good might use the local banks to a greater advantage than many of us do, when we lack sufficient capital to do business. At this time of the year, we can usually buy feed for considerably less money than it costs later. By securing a loan from the bank for this purpose, we might put in our winter's supply and save a good many dollars by paying the bank only a few dollars' interest.

The best way would be for several farmers to pool their orders and buy in car lots. This same method might apply to many other purchases made for the farm. We hear much of rural credit or farm loans and easier way for the farmer to obtain money with which to do business, I believe too easy credit might prove a curse to many farmers and agricultural interests as a whole.—E. E. W., New York.

"TOOTH AND NAIL FOR PROHIBITION"

I notice your article "Are Farm People for Prohibition?" I am a farmer and am tooth and nail for prohibition. I know every farmer in this vicinity and am sure that 80 per cent are dry.

Let the writer of the letter that heads your article line the wets in one row and the dries in an opposite row, walk up and down between them, see which crowd he would prefer to belong to.

If the writer of the letter will give me one convincing argument why I should vote wet, I will vote it. For the one, I will give him one hundred reasons why I should not.—J. A. F., Schoharie Co., N. Y.

Embury
SUPREME OIL LANTERNS

No. 160

\$1.50

Embury is one of the oldest names in America, and in the lantern business it stands for solid worth and progressiveness. The Embury Supreme Oil Lanterns are models of convenience, strength and durability. Ask to see one the next time you go to the store, and compare it with any other.

No. 160 Embury Supreme burns 35 hours, its improved burner, one inch wick, gives 20% more light, it is windproof and rainproof, and will give lasting satisfaction.

Order from your dealer. If he has none in stock we will mail postpaid on receipt of price.

NOTE—When ordering by mail, be sure and mention No. 160

EMBURY MANUFACTURING CO.
WARSAW, Dept. F, NEW YORK

HERE'S WHAT YOU WANT

Made from heavy, tough wrought steel—double tinned—they wear well and the handles are shaped just right to fit your hand.

From 34 years experience we know you'll find satisfaction with our line of milk cans and other dairy equipment.

Figuring the Size of Pulleys

I have an eight horsepower engine with a speed of 335 revolutions per minute. The pulley of the engine is 22 inches in diameter. The pulley on my threshing machine is six inches in diameter. The threshing machine should have a speed of 1,050 revolutions per minute. I want to run the thresher from a line shaft. Now what size pulleys would I need on the line shaft to give me that speed? I also have a pulley five inches in diameter for same threshing machine. If I use the 5-inch pulley, what size pulley on the engine would I need then?

I also have a feed cutter with a 13-inch pulley and it runs about right when run direct from the engine. However, I want to run it from the line shaft also. What size pulleys will I need to keep it at about the same speed?—H. S., Pennsylvania.

UNLESS it is absolutely unavoidable a farm line shaft should not be run faster than 250 revolutions per minute. To obtain this speed for the shaft, using your engine which has a 22-inch pulley and runs at 335 revolutions per minute, it would require on the shaft a 29-inch pulley. There is a very simple rule to follow in finding the size of the pulley to be used. Multiply the two things or quantities you know about one pulley together. Divide by what you know of the other or second pulley and you will find out the other factors or what you desire to know about this second pulley.

In your case you know the size and speed of the engine pulley. Therefore multiply these two quantities together (335 x 22 equals 7,370). Assume a speed for the line shaft pulley of 250 revolutions per minute. What you want to know is how large this pulley must be. Therefore, you divide 7,370 by 250 and get 29.5. Therefore, either a 29 or a 30-inch pulley must be used, preferably a 29-inch pulley as this is a driven pulley.

Same Rule for Other Problems

All of your other problems may be solved by using the same rule. Take your thresher, for example. It is to run at 1,050 revolutions per minute. You have a 5-inch pulley for it. The line shaft turns at 250 revolutions per minute. Multiply the two things you know or the two quantities of the thresher pulley (1,050 x 5 equals 5,250). Divide this by what you know about the line shaft pulley, namely its speed of 250 revolutions per minute. The result will be the necessary size of the pulley for the line shaft (5,250 divided by 250) or 21 inches. Figuring similarly, for a pulley to drive your feed grinder from the line shaft, the latter turning at 250 revolutions per minute, it develops that you would require a 30-inch pulley.

I would suggest that you put a smaller pulley on your engine, for by doing so you could use smaller pulleys on the line shaft. Using a 12-inch pulley on the engine would make it possible to use a 16-inch pulley on the line shaft for the belt from the engine and another 16-inch pulley on the line shaft for the belt to the feed grinder. If you use the 5-inch pulley on the thresher, a 21-inch pulley would be required on the line shaft to drive the thresher. If you were to use a 4-inch pulley on the thresher a 17-inch pulley would be large enough for a line shaft pulley to drive the thresher.—F. H. B.

GAS ENGINE DUTY

Will you kindly tell me if a gasoline engine doing light work, on a line shaft can charge a set of batteries at the same time? Would it take any more power? Would it be satisfactory as a home plant for lighting with electricity and perhaps some light work?—A. H. H., New York.

The ability of a gas engine to charge a battery simultaneously with the accomplishment of other work will depend upon the power required to operate the electric generator and the power of the engine. The rate of charging of the battery will depend entirely upon the size of the generator. A generator of small power requirements can probably be hooked up with a gas engine without any very appreciable increase in the load on the gas engine. If the gas engine has a little reserve power, it will handle the job without any particular trouble. Naturally, it will require some more power, since it takes power to generate electricity. A lighting plant made up of separate units, including separately mounted gas engine and generator is entirely practical. The current can be taken directly from the generator for lighting and small power purposes.

Feed Your Low-Grade Wheat

ON the advice of the best authorities, wheat is now being fed to make pork. Wheat at 75 cents a bushel [or less when it is low-grade, shrunken, and unsalable] has a hog-feeding value of \$1.00 a bushel—and it is from 8 to 10% more valuable than corn as a pork builder. It is nutritious and palatable and has more mineral matter and protein. Two objects are gained by wheat feeding—the low-grade surplus is turned into good money on the farm, and the price of No. 1 wheat will be pushed higher.

All authorities agree that, because of its hardness, wheat must be ground for feeding. Coarse grinding releases 10 to 22% more feeding value. Here McCormick-Deering Feed Grinders are especially well fitted to come to the aid of the farmer. Famous for years for their fast, many-sided work in small grain grinding, they are ideal for handling surplus wheat just as desired.

There are three types and sizes of McCormick-Deering Feed Grinders. The *Type C* handles small grains and shelled corn or a mixture of both. The *Type B* mills are for ear corn. They crush the cobs and grind cobs and corn together.

They also grind small grains and shelled corn. The *Type D* grinds corn in the husk, pulverizes the cobs and husks, and makes a fine meal of the whole mass. They also grind corn on the cob and small grains.

Ask for a demonstration of these general-purpose grinders at the store of the McCormick-Deering dealer. See what they will do for wheat or any other grain, or for corn in any shape. Let them show you how to get maximum food value out of grain when run by the most economical power—McCormick-Deering Kerosene Engines.

INTERNATIONAL HARVESTER COMPANY
606 S. Michigan Ave. of America (Incorporated) Chicago, Ill.

McCormick-Deering Corn Shellers

DO not forget that now is the time to prepare for your corn shelling. McCormick-Deering shellers have made excellent records for clean work and durability. They are made in seven sizes and styles, covering hand shellers, hand and power shellers, and large cylinder shellers for single farms or custom use. Capacities range from 20 bushels up to 400 bushels per hour. Here again McCormick-Deering engines and McCormick-Deering Tractors provide the most satisfactory power.

American Fence and Steel Posts

A dollar's worth of fence that lasts five years costs 20c a year. A dollar's worth of fence that lasts 20 years costs five cents a year. American Fence is the cheapest fence to buy simply because it wears best and lasts longest.

Full gauge wires—full length rolls—long-life galvanizing—these are the reasons for American Fence quality and durability.

Your dealer carries American Fence and Steel Fence Posts for quick delivery.

The only original and genuine.

FARMERS TOBACCO UNION, DI, PADUCAH, KY.

THE Republicans increased their control of the New York State Assembly by six votes on election day, making the 1924 line-up: Republicans, 87; Democrats, 63. This leaves a divided government again at Albany with a Democratic governor and Senate and Republican Assembly.

The Democratic candidates for Supreme Court in Manhattan and Bronx judicial districts were all elected, and the Democrats won the county elections in Kings, Queens and Richmond. In general, there was an increase in Republican strength in up-State districts.

The amendment to the State constitution providing for developing the water power of the Adirondacks was overwhelmingly voted down. The soldiers' bonus providing for bonding the State for \$45,000,000 was carried, as was also the amendment giving cities more home rule. The referendum on a \$50,000,000 bond issue to increase the capacity of State institutions was carried.

WAYNE COUNTY FRUIT GROWERS REVIEW FIELD TESTS

ALVAH H. PULVER

The annual orchard tour of the Wayne County Farm Bureau this year was the biggest success of its kind ever held and at its conclusion the growers immediately voted to have the matter brought up again next season. Fully seventy automobiles were in line for

the trip, the representative from the State College at Ithaca being Professor J. Oskamp, extension pomologist, who played an important part in the program. Miss Grace Gilchrist, plant pathologist from Great Britain; A. G. Newhall, fellowship man from Williamson, and H. W. Fitch, fellowship man at the Sodus Fruit Farm, were also present.

The first stop was made at Alton, where Manager Wagner of the bureau addressed the growers, who stated that the fifty-mile trip would be spent in noting the results of certain practices that were being carried on by the growers. The meeting was then turned over to the bureau assistant and spray specialist, Rudolph Illig, who gave a brief history of the situation at each stop. The first stop was at the farm of Louis Stell, where a demonstration orchard was inspected, seven sprays being applied. In July, hydrated lime was added to repel and control the cranberry root-worm beetle.

The next stop was made at the long term pruning demonstration at the H. W. Davis farm, Alton. The college pruned trees were larger in size and had a better crop than the local farmer pruned trees. At I. R. Granger's, Wolcott, another demonstration orchard was visited. Lime sulphur was omitted in the last spray. There was a good, clean crop of fruit on the trees. The last morning stop was at the George Mitchell farm at North

Rose. He sprayed all orchards with a delayed dormant liquid spray after which dusts were used. In one block, green copper and 90-10 dusts were used, while in a McIntosh orchard ten 90-10 sulphur arsenate dusts were applied. All his fruit showed up well, many saying it held its own with any seen during the day. His foliage was green and the trees made a good growth. Mr. Mitchell announced his adherence to the spraying schedule as put out by the farm bureau, and this was supplemented by watchful study of the barometer, an instrument he recommended to all fruit growers for predetermination of storms.

After dinner at a resort, near Sodus Bay, a stop was made at a thinning demonstration at Marvin Shannon's, Alton. It was shown that Baldwins as well as early fruit could be profitably thinned. This orchard was sprayed six times, each tree receiving four pounds of sulphate of ammonia. Every tree showed it, for those old trees were making a good growth in spite of the present crop.

At Wesley Grinnell's, Sodus, another dusted orchard was visited. A delayed dormant liquid spray and seven applications 90-10 sulphur arsenate dust were made. Another demonstration orchard was visited at the Olin V. Jolley farm on the lake road. The July spray had been applied late and no later spray has been given, as a consequence of which considerable side-worm injury resulted. At Frank Thorpe's farm, Williamson, a fertilizer demonstration was visited. The fertilizer was used dollar for dollar. There were four plots, ten pounds of nitrate vs. fifteen pounds of bone vs. twenty-one pounds of acid vs. check.

The tour was concluded at Edward DeRight's place, and adjoining farm. He had a good, clean crop of Greenings which were sprayed five times according to recommendations.

NEW YORK COUNTY NOTES

Schenectady Co.—Only a small acreage of rye has been sown this fall. Buckwheat yielded a fair crop as did potatoes. Corn turned out rather light. Recent rains have helped fall plowing and about the usual amount will be completed. Eggs are very high and price is high. The price of butter is very satisfactory. Several farms have been traded for city property and there are quite a number of farms for sale.—S. W. C.

Chautauque Co.—The buckwheat crop turned out well as did the late potato crop. Early potatoes were pretty much a failure as is the apple crop. Up to the first of the month, we have not had enough rain to help the water supply or pastures to any extent. Except where cows are being fed in the barn, the milk flow has been pretty well checked by the dry weather. Hay is selling for \$12 a ton in the barn. Potatoes \$1.25 a bushel, apples \$1 to 1.50 a bushel, eggs 55c a dozen, butter 50c a pound.—A. J. N.

NEW JERSEY FARM NEWS

Salem Co.—Folks are gradually emerging from the rush of fall work. The sweet potato crop has been dug as has the late Irish potato crop. Both crops are turning out fair.—S. B.

Mercer Co.—Fall grains look very fine. Recent rains have helped them immensely. The acreage of fall grains is quite large. Farmers are husking corn and are reporting that yields are good. Many farmers said that they are saving their best ears for the corn shows, which will be held in the various territories this month preparatory to the Mercer-Bucks County, Pa. show and the corn show at the New Jersey State Agricultural College in January.—Mrs. J. E. H.

Letters From A. A. Readers

Recollections of An Old Soldier—Topics of Interest

"I ENCLOSE one dollar for renewal of my subscription. It seems like an old friend and I must give you a reminiscence. When I was a lad of maybe twelve, which was sixty-seven years ago, for I am a Civil War veteran, my father used to take the American Agriculturist. That and the "Tribune" and the Bible were his standbys. I had wanted a dictionary, for I was a somewhat studious lad, but father, like most farmers, had to figure expenses close. Well, that year you offered a Webster's unabridged dictionary for ten, or was it twelve? subscribers, and I worked hard and got the club. I remember father paid for several and took produce for them. Our nearest railroad station was Addison, twenty-two miles away, for we were in the Pennsylvania woods clearing up a hemlock farm. One day I went to our near town, Knoxville, four miles away, to have my foot measured for a pair of boots, as everybody did in those days, when I found that a merchant with whom we traded had been to Addison and found a package there for me and kindly brought it over to his store. I grabbed that dictionary and, forgetting all about my long-looked-for boots, I trudged home with that ten-pound load, the happiest lad in the State. I have bought many books since and was principal of schools forty years, yet I have that old book now as one of my most cherished possessions, and I always look on the Agriculturist with kindly regard."—F. M. SMITH, Holland, N. Y.

HUNTERS ARE BECOMING A NUISANCE

I am a reader of the American Agriculturist. My son is a subscriber to the paper. I wish to say a few words about hunters and pheasant hunting. It is a very foolish thing to stock up our country farms with the birds and then allow hunters to run over us in the way that they do. They pay but little respect to posting. They go four or more in autos, park by roadsides, dig your potatoes, pick apples, sweet-corn, squash, anything in fact that they can put into bags and carry away.

On Sunday, October 14, one of our farmers saw four hunters on his premises helping themselves to his potatoes. One of them shot his gun and a bird dropped. The farmer reached the place where the bird fell first and found that it was a hen pheasant. The farmer forbade the hunter from taking the bird away, and telephoned to an officer. The officer came and took the bird and said that he would take care of the case. As yet we have not heard in what way it was settled.

There will have to be some way to get along with the hunters. Farmers cannot put up with their abuse. They are out Sundays and every day during the week.

I am sending a clipping from one of our papers about what happened last Thursday to a woman who is my neighbor who is some sixty or more years old. You can see that some of the time it is not safe to go out of the house.

Woman Shot By Hunter

Mrs. John Kadlback narrowly escaped being shot to death by a hunter last Thursday as she was carrying water from a spring to her house. The shot struck a pail, grazed the little finger on her left hand and peppered her dress full of shot holes. The woman is nearly prostrated by the shock. It does seem that the hunters go frantic over game, when they go into the fields, and use no regard where they are shooting or how near the buildings. And as far as your posters are concerned hunters don't stop for them. Some stricter means will have to be taken in the future or more people and stock will be in danger of life. It really sounds like war over the country on a hunters' day.

A CHEAP SOURCE OF POWER

Your editorial, "Stored Heat," in your Sept. 22nd issue, is surely correct. The heat of the sun will be so used, sooner or later, but perhaps not until we are forced to it. The suggestion you make about water power, however, makes me wonder why more of it has not been developed. In many communities there is plenty of power from small streams, that could be used, very cheaply, to light and give electric power to the

people living there, but no one seems to develop them. It need not be an expensive job. Many communities have old grist mills, no longer used and going to decay, that could be turned into electric plants for very little. Those that have no old mills, have some stream that could turn a waterwheel, and it would not cost much to install a plant there large enough to care for the needs of the community. Yet such places will continue to go without the comfort and convenience of electric light and power. The writer has seen many such com-

munities in the eastern part of this country, and most of them say they want electricity, but none of them seem to have the ambition to start such a plant for themselves, or to have a citizen among them that would put up such a plant as an investment for himself. If the writer had the money to start such a plant himself, he would have started one long ago, and given to some community the much needed comfort and convenience of electric power that they were too slow to develop for themselves.—W. H. S., New York.

DISCUSSING SCHOOL BILL

I am glad you are printing a series of discussions on the N. Y. Rural School Bill in the "Old Reliable." We are

studying this Bill and the Report of the Committee of Twenty-one in our local Home Bureau, and have enjoyed and been helped by articles appearing from time to time in your paper. We shall read the discussions on the bill as they appear. When rural people understand the bill they are convinced of its soundness.—Mrs. B. B., New York.

WE ARE NOT LESS SPIRITUAL

Let us not perceive with alarm this changed status of our once beloved Country Church. It is so natural, so inevitable I think, if we but consider how all our other institutions and practices have changed also. Just because we take less time for quiet (Continued on page 345)

An All-Fuel Engine—This Standard WITTE Burns Kerosene, Gasoline, Distillate or Gas

(No Special Attachment Needed)

Here is the answer to the demand for cheaper power—and the opportunity to show a profit of \$1,000.00 or more this year. With the WITTE Throttling-Governor Engine you can do all the jobs easily and quickly at a fraction of the cost of "hired help."

Makes All Farm Work Easy and Cheap

This WITTE Engine stands alone as the standard of farm power—with steady and reliable performance at any speed. Regardless of the work—pumping, grinding feed, sawing wood, churning, etc.,—it makes all work easy and cheap. Easily moved from place to place, you can save the work of several men all the time.

The Real ALL-PURPOSE Engine

This WITTE Engine burns any fuel,—kerosene, gasoline, distillate or gas—the cost of operation is always small. Equipped with the WITTE Speed Regulator, the power range enables you to do all jobs at a big saving.

Equipped with the Famous Wico Magneto The WITTE Engine is equipped with the famous WICO MAGNETO—a guarantee of efficient operation in all weather and temperatures.

The most dependable and best ignition system known today. Far superior and more economical than the old style battery ignition.

Sold DIRECT from FACTORY to YOU

Remember this—my engine is sold direct to you by the man who builds it and I have over 100,000 satisfied customers all over the world. This WITTE Engine, at the lowest price in history, is the result of over 40 years devoted to building engines in the largest individual engine plant in the world.

Write Today For My BIG FREE ENGINE BOOK

I want every progressive farmer to write me today for my big free illustrated engine book and my special selling plan which puts a WITTE to work on your place for only a few dollars and gives you nearly a year to pay. NO OBLIGATION—just write me—that's all.

Start Your Pullets and Moulded Hens to Laying

You have had your summer's poultry cares.

Now is the time for you to cash in on eggs.

Go after those dormant egg organs that moulting threw out of gear.

Go after them with the "Old Reliable"

Dr. Hess Poultry PAN-A-CE-A

Pan-a-ce-a puts the egg organs to work. It starts the feed the egg way.

Feed Pan-a-ce-a—then you will see red combs and red wattles.

It brings back the song and scratch and cackle.

It gives hens pep.

It makes music in your poultry yard. That's when the eggs come.

Tell your dealer how many hens you have.

There's a right-size package for every flock.
100 hens, the 12-lb. pkg. 200 hens, the 25-lb. pail
60 hens, the 5-lb. pkg. 500 hens, the 100-lb. drum
For fewer hens, there is a smaller package.

GUARANTEED

DR. HESS & CLARK Ashland, O.

I spent 30 years in perfecting Pan-a-ce-a.
GILBERT HESS
M.D., D.V.S.

Dr. Hess Instant Louse Killer Kills Lice

OIL LIGHT BEATS ELECTRIC OR GAS

BURNS 94% AIR

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

What Do You Know About Horses?

If you were hitching a "tricky" horse double and he blazed away at the man in the rear, what would you do to insure good behavior always? Would you whip him—or jerk the rein—or yell at him?

Special Course FREE

This amazing FREE Introductory Course in Horse Training tells all about breaking horses and teams of bad habits forever. Fully illustrated and brimful of interesting pointers on horse training. Sent absolutely free to any farmer or breeder. You can't afford to be without this valuable information—it may save you hundreds of dollars—perhaps even your life! Mail post-card NOW! Beery School of Horsemanship, Dept. 1611-A, Pleasant Hill, Ohio

Oat Sprouter
\$2.99

You can make a better sprouter than you buy. This sprouter was made in one evening by a 14 year old boy with a saw and hammer. The cost, with heater, was \$2.99. Thousands in use. All say it is the best and handiest made.

Make Layers Out of Loafers

To make hens lay their best, in winter, growing green feed, rich in vitamins, must be fed. Sprouted oats are best. The Putnam Home Made Sprouter yields the best and sweetest sprouts and with the least work. I will send, free, plans for making this sprouter with description of Little Putnam Stove to heat it. Also instructions for use of stove to keep fowls' drinking water unfrozen. Stove holds three pints of oil. Burns a month without trimming or filling. Patented burner. Nothing like it. Ask your dealer, or send me his name and \$2.50 and get one by return mail, postpaid. Try it. If not satisfied, return in 10 days and I'll cheerfully refund your money.

I. PUTNAM Route 1127-O, Elmira, N. Y.

"The Truth About Wire Fence"

SOLUTION OF THE MYSTERY THAT HAS COST FARMERS MILLIONS OF DOLLARS

A cedar post outlasts a pine, so two rolls of wire fence may look alike, and cost the same, yet one will last twice as long as the other. Our circular solves the puzzle and shows you how to save that 100 per cent. You can know what you are buying just as surely as you can tell Oak from Poplar.

For the Cow Men

New York Holstein Breeders Hold County Meetings

THE members of the Jefferson County Holstein Club had a meeting at the Woodruff House in Watertown on Tuesday, October 30th. Breeders and dairymen from all parts of the county were invited, and those who were able to come, in spite of a very rainy day, had a splendid evening enjoying a banquet, which was followed by the new Holstein "movie."

F. C. Overton, president of the club, officiated and acted as toastmaster. Following the picture he introduced C. F. Bigler, president of the New York Holstein Friesian Association, who spoke briefly of the achievements of the Association during the past year. M. C. Bond, secretary of the New York Association, was then introduced and told of the plans for work during 1924. He also told of the new membership plan whereby each county has a share of the expense of the State Association to carry in order to make the work possible. The appointment of each county being determined upon by using the number of members in the National Association in that county as a basis for figuring its share of the cost in operating the State Association.

The most encouraging thing about this meeting was the enthusiasm which the breeders showed and indicating the better conditions which are gradually coming about. Jefferson County is one of the most active Holstein counties in New York State and apparently proposes to continue so, if we can judge any by the enthusiasm at this meeting.

St. Lawrence County Breeders' Hold Two Meetings

On Wednesday and Thursday, October 31 and November 1, meetings were held in St. Lawrence County at Ogdensburg and Massena. The breeders were a little disappointed in not being able to see the Holstein movie, due to the lack of an available movie machine. However, definite plans are being made to have this picture at the annual meeting, which will be held in Ogdensburg sometime in December.

Favorable discussion for the continuing of the Ogdensburg sale occurred at both of these meetings and considerable interest in the establishing of the annual show at Heuvelton. At each of these meetings, M. C. Bond, secretary of the New York Holstein Association, spoke concerning the work of the Association and plans for the coming year. There seemed to be some interest in having a picnic next summer where the model cow and bull could be shown in comparison with some living animals, and where the breeders could have a general discussion about the true type.

Franklin County Breeders' See Movies

Holstein breeders in Franklin County were invited to a meeting of the Franklin County Holstein Club, in cooperation with the county farm bureau in the Court House at Malone, Friday evening, November 2. A very good audience attended the meeting. The new Holstein picture was shown containing two reels, also a film entitled "The Model Dairy," and one on the operation of the milking machine.

Secretary M. C. Bond of the State Holstein Association was present and addressed the breeders on the work the Association has been doing during the past year and a few of the projects laid out for 1924.

Coming Meetings of County Holstein Clubs

Following is a list of the meetings of the various county Holstein clubs in the State of New York:

Nov. 16, Tompkins Co., Ithaca; Nov. 17, Chemung Co., Van Etten (afternoon); Elmira (evening); Nov. 19, Orange Co., Goshen; Nov. 20, Dutchess Co., Poughkeepsie; Nov. 21, Greene or Dutchess (Pine Plains); Nov. 22, Columbia Co.; Nov. 23, Rensselaer Co.; Nov. 24, Oswego Co.; Nov. 26, Onondaga Co., Baldwinsville (afternoon), Elbridge (evening); Nov. 27, Onondaga Co., Cicero or Liverpool (afternoon), Tully (evening); Nov. 30, Madison Co.; Dec. 1, Madison Co.; Dec. 3, Livingston Co., Avon; Dec. 4, Wyoming Co., Warsaw; Dec. 5, Cattaraugus Co., Gowanda (afternoon), Frank-

linville (evening); Dec. 6, Cattaraugus Co., Salamanca (afternoon), Randolph (evening); Dec. 8, Chautauqua Co.; Dec. 8, Allegany Co.; Dec. 10, Broome Co.; Dec. 11, Tioga Co., Oswego; Dec. 12, Sullivan Co.; Dec. 13, Chenango Co.; Dec. 14, Chenango Co.; Dec. 15, Oneida Co.; Dec. 16, Oneida Co.; Dec. 18, Herkimer Co.; Dec. 19, Herkimer Co.; Dec. 20, Schoharie Co., Cobleskill (evening); Dec. 21, Otsego Co.; Dec. 22, Otsego Co.

CAUSE OF STRINGY MILK

Will you tell me the cause of stringiness in our milk? Our cows are on dry pasture. Their feed consists of wheat bran, corn, gluten feed and purchased mixed grains that contain some molasses. They also receive green corn from the field. The cows are all tuberculin tested and are all in excellent health. However, if the milk is one day old, the cream on the milk draws long strings. Will you kindly inform us how to prevent this?—A. T., New York.

The normal cause for stringy milk and cream at this time of year is the result of the growth of certain types of bacteria which get into the milk. So far as we know the usual source of these organisms is water and they may get into the milk either as a result of the cows wading in streams or ponds in the pasture, the organisms getting on the cow's body and then falling into the milk pail at milking time, or they may get into the dairy utensils from the water which is used for washing and rinsing them. They grow rapidly at fairly low temperatures, producing a slimy and gelatinous material in the milk which gives it the stringy orropy condition.

So far as we know these organisms are not at all injurious to health, but of course the stringy condition which they produce is a serious difficulty in the milk or cream business.

This trouble can usually be overcome by a thorough scalding of all the utensils which the milk touches, either by sterilizing in steam or scalding with water which is practically up to the boiling point. Every year about this time we get a number of inquiries about this trouble and every case that I have known has been cleared up by a thorough treatment with boiling water.

MIXING AND GRINDING FEED

I have about 700 bushels of wheat, about the same quantity of oats and 1,000 bushels of corn. In addition to that, I have about 80 tons of alfalfa and plenty of ensilage. I have about 12 tons of dry grains and 10 tons of cottonseed meal. I would like to know if it would pay me to purchase a mill to grind it up? We have a 15-horsepower motor for which we have to pay \$15 a month to a power company, whether we use it or not. We would like to get some use of this charge as long as we have to pay for it.—J. K., Pennsylvania.

As long as you have that overhead charge for current, you certainly may as well get as much out of it as you possibly can. In addition to buying a mill and grinding your feed, that motor should be pumping water, sawing wood and doing everything possible where power is required.

In grinding up your feed you could make a very good mixture in view of the fact that you have plenty of ensilage and alfalfa, as follows: Take 500 pounds each of oats, corn and wheat and grind up the mixture. To this 1,500 pounds of mixed ground cereals, add 300 pounds of your brewers dried grains and 200 pounds of your cottonseed meal. This mixture would have in it plenty of protein to feed with the alfalfa hay.

COW CRAVES SALT

I have a cow that is always chewing old bags or licking shingles on the barn. Could you tell me what ails her?—E. L., New York.

Undoubtedly your cow is looking for salt. Give her a good cathartic and then place a salt block where she can have access to it regularly.

Your paper has been taken in our family a number of years, by my husband's father in Alabama some 50 years and by my own father in Kansas since about 1880. We have always appreciated its sterling worth.—Mrs. A. E. SHARP, Alberta, Canada.

The Apple Exposition

"By Their Fruits Ye Shall Know Them"

IN a splendidly written little circular published by the Clintondale Fruit Growers' Cooperative Association of Ulster County, and distributed at the Eastern States Apple Exposition, we found the following paragraph:

"If Rip Van Winkle could to-day awake from his long sleep in cool fastnesses of the Kaaterskill, and revisit his fabled haunts, he would find scores of thrifty orchards raising their graceful branches, it would seem, in Thanks-giving to the kind Power who so bountifully blessed this soil, this climate, and protected this spot for the full fruition of its Destiny."

This description applies not only to the beautiful and productive Hudson Valley, but to all of the fruit growing sections of the East, as you would all agree, had you been able to attend the Eastern States Apple Exposition in the Grand Central Palace last week. In quality, size and artistic arrangement, this apple show was the best we have ever seen, giving one a feeling of pride in being a native of a land that can bring forth so bountiful a harvest.

In this largest of exposition buildings in the world, there were two whole floors devoted to the fruit exhibits and the allied industries which manufacture and sell the equipment the fruit man needs.

Most of the exhibits were arranged by States, with New York easily in the lead, both in volume and quality. The most of New York fruit is sold in the barrel package and this fact was emphasized in the Western New York "Cataract Brand" exhibit, in the long rows of barrels with the tops off so that the visiting consumer could see New York's leading commercial varieties, which include the old standbys, Baldwin, King, Greening, Northern Spy and McIntosh. One attractive feature in the exhibit was the cross-section of barrels showing the uniform pack from the top to the bottom. One lesson at least has been learned in marketing and that is to make the last apple in the pack as good as the first.

Much of the New York exhibit was in sections, put on by cooperating organizations and institutions. There were exhibits of the State Department of Agriculture, the New York State College of Agriculture and the Geneva Experiment Station, which, by the way, had an exhibit of ninety-six varieties.

May we stop here to make the comment that in our opinion, as far as the commercial success in apples is concerned, ninety-six varieties is about ninety too many. We even question the advisability of constantly working to discover and exploit new varieties of apples, for we have too many already. One of the reasons why the Westerners have made a success of their apples is that they have confined the number of varieties to two or three, which the city consumer has come to recognize and know.

The most practical and worth-while exhibits were probably those of the co-operatives. Among those were the Hudson Valley Cooperative with its new Storm King brand, which had a real commercial exhibit, with barreled stock right out of storage. This was also true of the Western New York Co-operatives. The Clintondale Cooperative was the outstanding individual exhibit of single cooperative packing houses. The Western New York Co-operative Packing Association had a large exhibit arranged to emphasize their Cataract brand, their uniform

pack and volume of barreled apple business. Present also were many individual exhibits from the Hudson and Champlain Valleys, the latter put on by the Clinton and Essex County Farm Bureaus. Speaking of barreled apples, you will be interested in the comment of a Mrs. Consumer at the exhibition when she said "Oh, look at the apples in barrels."

Mention should be made also of the attractive exhibit of the Empire State Honey Marketing Association. Particularly interesting was the comment of the honey producer in charge of the exhibit who said that he thought he could see the beginning of the end of the maple syrup and sugar industry, and much more attention paid to producing honey.

The Chautauqua Grape Growers broke the monotony of so many apples by a large showing of New York grapes. In addition to the exhibits of the organizations and institutions mentioned above, there were many individual growers' exhibits which space will not permit more detailed mention.

In the shows put on by States other than New York, the Massachusetts exhibit was easily the best. Never anywhere have we seen as large and fine a display of McIntosh apples. A Massachusetts orchard, some of which was in bloom, and some with apples ready for the harvest, surrounded by a typical New England stone wall, attracted a lot of attention, as did also the demonstrators who

showed how Cape Cod cranberries are harvested, sorted and packed. The Vermont exhibit emphasized its maple products as well as its apples, advertised as "having the flavor of the hills". Maine was well represented.

Connecticut showed a road with various vehicles rapidly moving over it, carrying all of Connecticut's many farm products, with fruit in the lead. The outstanding feature of the Maryland show was an individual display of the products of the Maryland Orchards Corporation, advertising "Maryoco" apples. The initials of the State of New Hampshire were spelled with Greening apples in a sea of McIntoshes. This, together with a map of New Hampshire made with apples attracted considerable attention.

The women were on hand, as they always are and should be in these days, with demonstrations showing how apples and other fruits are used in the modern home. There were apple recipes, apple jellies, and preserved apples of every form and description.

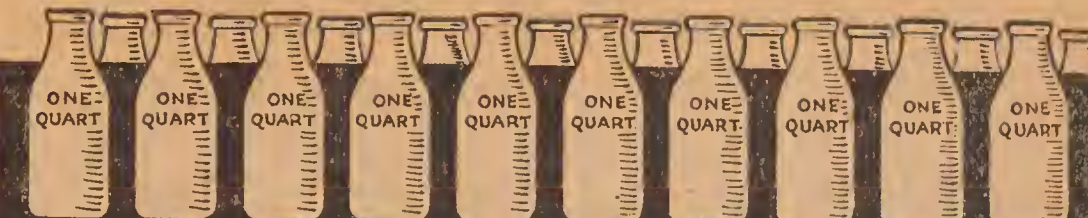

The chief criticism of this exposition was the lack of attendance. While on some of the last days there were quite a few people in, the numbers did not justify the great effort both in time and money to put on such a good show. The trouble was not due to any lack of publicity, for the show was well advertised in both country and city. In our opinion, thousands of people were kept away by the admission charges.

Several years ago, when the dairy-men began to try to interest the consumer in milk and milk problems, by the great milk show, we raised the question on the policy of charging admission. We never could understand the sense of spending many thousands of dollars, to advertise a great industry and then charge the public admission to see the advertising. As one consumer said: "I might spend ten or twenty cents in carfare to have you show me at your

(Continued on page 350)

20 Extra Quarts of Milk

Count 'em From Every Sack of

International Special Dairy Molasses Feed

as compared to using wheat feeds or ground grains. We guarantee this increase has been secured in hundreds of actual tests. INTERNATIONAL SPECIAL DAIRY MOLASSES FEED contains protein, molasses and fat combined in proper proportions to provide the necessary nutrients and energy required for maximum milk production. Both protein and molasses produce milk. Special Dairy contains both.

This great feed is digestible and palatable and is skillfully processed and mixed, thus insuring a big extra gain in milk. Accept no substitute. Inferior brands offered by other mills cannot produce the same profitable results as Special Dairy.

My Engine Does the Work of 6

Read the Amazing Facts About
This Wonderful Farm Engine

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."

—A. Y. Edwards

The regular power jobs on your farm probably vary from about 1 1/2 to 6 H. P. Yet there's no need to have two or more engines for these jobs. Today you can get six engines in one. You can get an engine that will deliver 1 1/2 H. P. for the little jobs, 6 H. P. for the heavy work, or any desired power in between. You can change power as you change jobs—change power instantly. And you will get high efficiency and low cost at all powers.

No Other Engine Like It

There is no other farm engine like the Edwards. It pumps, washes, churns, separates, milks, runs an 8-inch grinder, 30-inch wood-

saw sheller, small silo filler, concrete mixer, spray rig, etc., and does every job easily and cheaply. No other engine can do this. It is easy to move and can be set anywhere and put to work without fastening down. Burns kerosene or gasoline. Smooth running. No vibration. Safe—no cranking. Safety fly-wheel and all moving parts enclosed. Anyone can operate it.

What Users Say

Fred Dunderi, Strathcona, Minn., says: "I certainly like my Edwards Engine. Runs an 8-inch burr mill full capacity. Has plenty of power and then some. It certainly works fine. I like its varying speed and power and its light weight, it is so easy to move from job to job. Best and handiest engine I have ever seen or used and wouldn't part with mine at any price if I couldn't get another one and I wouldn't go back to the old-fashioned heavy type engine to use as a gift. The Edwards does all the company claims for it."

"One of my neighbors was looking over my Ed-

wards and I ran it for him and changed it all the way from 1 to 6 H. P. He will buy one right away. He is using a 4 H. P. at present but at times needs 6 H. P. so this would be the very engine he wants."

A. C. Lukehart, Dayton, Pa., says: "Well pleased with my Edwards and would not trade it for any other kind of engine that I know of as it is so handy to move from one job to another and the company has been fair and square to deal with."

Free Trial Offer

Now—I know I am making some extraordinary claims for my engine. I want to prove them to your satisfaction. I want you to try the Edwards Engine absolutely free. Don't send me a penny. Don't send me an order. Just write your name and address on the coupon below and I'll send you complete information about the Edwards, together with my straightforward, unconditional free trial offer. You will not be obligated in any way.

"Heads I Win, and Tails You Lose"

(Continued from page 333)

"I shipped them in two lots. The first lot consisted of two (2) does and two (2) bucks. They said that they had received all O. K., and that I was to send my contract back and get a renewal before I could get my check. I had a true copy of the contract made, then I sent the original to them and kept the copy. In answer they told me that I had shipped Flemish Giants instead of Black Siberians and they were under weight. Now I have proof that I have never had or owned another kind of hares but the ones purchased from the company, and their young, so if I shipped them Flemish Giants, they misrepresented them to me as Black Siberians."

Another typical story comes from Pennsylvania, from a gentleman who paid \$92 to prepay an order. He writes as follows:

"After waiting five months for delivery, on September 17, I submitted a letter to the Standard Food & Fur Association in which I cancelled my order. On September 25 I received a crate in which were three rabbits shipped via the American Express Company, express bill on end of crate was dated September 20—please note five days express live stock two hundred miles—and was marked 'Four (4) live rabbits.' On September 26 I received a letter written under date of September 24 from the Standard Food & Fur Association advising 'that we have this day forwarded you an exceptionally fine consignment of Imported Spotted Giants, etc.' On September 27 I received another letter dated September 24 from the Standard Food & Fur Association saying 'We have this day forwarded you 3 does and 1 buck of French Argent de Champagne via the American Railway Express Company.' Both letters were signed by the Secretary but his signature was undecipherable so that his name remains a mystery."

"We place the rabbits in pens and, of course, have been feeding and taking proper care of them. To-day we made an investigation with the purpose of determining their sex and there was revealed the exceedingly pleasing (?) fact that each of the three rabbits were in complete possession of all the essentially masculine faculties. "Permit me to summarize: "April 18, 1923—Ordered 3 does and 1 buck Imported French Argent de Champagne. Check in amount \$92.00 full coverage, forwarded therewith. "April 19, 1923—Receipt of order and check acknowledged by the Association, shipment to be made 'soon as possible.' "September 17, 1923—Letter forwarded cancelling order. (Five months during which \$92.00 of my money was working for the Association.) "September 25, 1923—Received 3 rabbits in crate marked 'Four (4) live rabbits.' Express bill dated September 20. "September 26, 1923—Received letter dated New York, September 24, advising 'We have this day forwarded an exceptionally fine consignment of Imported Spotted Giants.' Letter signed by Secretary of Association. "September 27, 1923—Received letter dated New York, September 24, advising 'We have this day forwarded you 3 does and 1 buck French Argent de Champagne.' Letter signed by Secretary of Association. "September 29, 1923—Wonder of wonders. Three doe and 1 buck of April 18, acknowledged as same on April 19 had undergone a change in the course of five months and on September 24 were Imported Spotted Giants, on the same day changed back to their original designation as French Argent de Champagne, on September 25, instead of four, their number was reduced to three, and still more marvelous on September 29, they were each possessed of faculties with which nature endows only the lordly buck."

An ex-soldier from South Dakota paid \$31.50 to the company for some rabbits. Read what he has to say about his experience: "Referring once more to my 'difficulty' with the Standard Food & Fur Association, 409 Broadway, New York, wish to state that we are still 'up in the air.' On June 25 you wrote that you would see that my money was refunded, as I requested. On July 5 they wrote you that the rabbits had been

REAL ESTATE

FLORIDA, Tampa and Hillsborough County invite you to winter here. Live outdoors. Wonderful orange groves, vegetable gardens, tropical scenery. Strawberries, Christmas to June. Fruits and flowers in profusion. Motor, fish, hunt, go boating on lakes, rivers, Tampa Bay or Gulf of Mexico. Health-restoring, balmy weather. Splendid business and investment opportunities. PRINTED ENVELOPES, NOTEHEADS—300 either, \$1. HONESTY FARM PRESS, Putney, Vermont.

EVERYTHING PRINTED!—Samples free. FRANKLIN PRESS, B-28, Milford, N. H.

shipped on June 25. I replied on July 24 that they had not arrived and that I would refuse them should they arrive at that late date. The rabbits were billed out of New York on August 8, and arrived, one of them dead, on August 13. On August 14, I refused the shipment, naturally. The agent returned them the next day, on his own responsibility, as he no doubt didn't want a lot of dead rabbits on his hands. I wrote the Standard Company a very civil letter, stating my case and asking for my refund, as they had filled a six months' old order against my repeated demands for cancellation and refund. They reply with a 'sassy' letter, saying they have filled their part of the agreement.—'Just like that.'

"I still need my money, what can you do for me?"

The foregoing are but a few of many complaints received about this company. The American Agriculturist has numerous of these complaints. We have tried repeatedly to get this company to live up to its agreements and in some cases, after considerable effort on our part, we have succeeded. Looking over our correspondence at random, we find the following statements from some of our subscribers, after we have succeeded in securing adjustment. One subscriber writes that if it had not been for our efforts "I am sure I would never have got anything but talk."

In another case we finally succeeded in securing the return of money in January, 1923, and the subscriber writes: "I have been trying to get this since last August, and I feel I would not have received it only for your kind help."

In various other cases, even after hard work on our part, we too have been unable to get this company to make adjustment and we have various letters in our files addressed to this company which are unanswered for months and months.

Naturally, we have refused to accept any advertising from this company and have warned our readers against it.

We think you will find it clear why we have refused to accept its advertising. Do you feel that the company is fulfilling its promise of "treating its customers fairly"? Let us know your experience with the Standard Food & Fur Association.

Remember that even though advertising of some kinds contains no direct misstatement, nevertheless, it may be misleading. The Penal Law of the State of New York provides that it is a crime for any person who offers goods for sale, to publish any announcement, statement or advertisement of any sort regarding merchandise offered to the public "which advertisement contains any assertion, representation or statement of fact which is untrue, deceptive or misleading."

"A Woman's Home Is Her Castle"

(Continued from page 335)

the farmer's lament paraphrased in the words of the comic opera—"Animal King":

The elephant ate all night
And the elephant ate all day;
Every cent of his earnings went
To keep that beast in hay,
Till he envied the lot of a Hottentot
On Africa's burning sands;
And he cursed the whim that had saddled him
With an elephant on his hands.

Perhaps the most significant recent change in the whole attitude of women toward the problems of living is illustrated by the sign on the wall of the office of a Kentucky farmer—"No complaints received here unless accompanied by a remedy". Formerly we protested against conditions only by complaining. To-day we are endeavoring to become enlightened enough to discover whether we can accompany the complaint with a sane, rather than an hysterical remedy—and we are not unmindful of the fact that sane remedies take time and therefore cannot be discovered, applied and made effective overnight.

One of the interesting signs of the times is everywhere evident in the effort of advertisers to appeal to the intelligent housewife. Realizing that the interest in the nutritive side of the food question is widespread, the producer is couching his appeal in terms of that interest, and realizing also that the scientifically trained housewife is looking for facts and not fancies, he is even

writing his advertisement in terms of price per pound as being the only fair basis for comparison of costs.

To-day, a lack of knowledge of household affairs is no sign of wealth and distinction. Modern studies of the physical welfare of the family have brought out as never before the need for clear-headed supervision of the home and for a revival of knowledge not only of the arts of housekeeping but of the scientific principles underlying the arts. A well-balanced combination of the arts and the sciences related to housekeeping will make of home-making a real vocation and will add to the sum total of better and happier homes throughout this country of ours.

We are Not Less Spiritual

(Continued from page 341)

thought and consideration of "worthwhile" things, is no sign that we are "less spiritual" than our parents, or that we don't strive for high ideals.

The automobile, the phonograph, the moving pictures and low price of good literature are the things we can easily see that have reduced the attendance at our rural churches. The kind of men that used to be the good old-fashioned dominies are now found in fields of endeavor where they can reach a hundred people to a possible one in a

church. We get their message through books and editorials in our papers and magazines. We get better music from our phonographs than any rural church could hope for. The element of sociability is made up in various ways, and from the number of times central says "line's busy," I think the telephone is a God-send for the ladies. There are other things, less tangible, but no less important, that have made the younger generation seem to drift away from the church.

I have but one suggestion as to a remedy. Lift the veil mystery from the church and from religion. To love God is the most profound of human experiences. Furthermore, it is the result of a natural mental growth and spiritual development from within. It is entirely a personal and individual matter. It cannot be taught, but it can be aided by the church if we make our church a place of free expression. Let us learn to want to be brotherly rather than that we ought to be brotherly.—WENDAL C. BULL, Orange Co., N. Y.

Your paper, it seems to me, is getting better and better. "She Hath Done What She Could" and "The King Is Dead," in August 18 issue, are deep and touching. So really helpful and good. There have been many fine things.—Mrs. Mary Gourley, Meadville, Pa.

HARRY C. OVERMAN

OTTAWA MFG. CO.

Room 807-P

Magee Bldg., Pittsburgh, Pa.

ARE you satisfied to saw wood the back-breaking way? If so, don't waste your time reading further. If you and your boys are satisfied to fall trees, saw up logs and chop up limbs by hand and take 10 or 15 days of the hardest work to cut a small supply of wood, then you do not want my saw. But, if you have land to clear, saw-logs to get out, or your wood supply to cut, and want to cut wood to sell when prices are high, then you'll want an OTTAWA. Write me so I can tell you why I am not afraid to let any honest man have my Log Saw on trial.

The Broad Highway—By Jeffery Farnol

SLOWLY, slowly the moon, mounted into a cloudless heaven, higher and higher, in queenly majesty, until the road before me became transformed into a silver track splashed here and there with the inky shadow of hedge and trees, and leading away into a land of "Faerie."

Indeed, to my mind, there is nothing more delightful than to walk upon a country road, beneath a midsummer moon, when there is no sound to break the stillness, save perhaps, the murmur of wind in trees, or the throbbing melody of some hidden brook. At such times the world of every day—the hard, hard world of Common-sense—seems to vanish quite, and we walk within the fair haven of our dreams.

From this ecstasy I was suddenly aroused by hearing once more the sound of a footstep upon the road behind me. I turned sharp about, and, though the road seemed as deserted as ever, I walked back, looking into every patch of shadow, and even thrust into the denser parts of the hedges with my staff; but still found no one. And yet I knew, that I was being followed persistently, step by step, but by whom and for what reason?

A little farther on, upon one side of the way, was a small wood or coppice, and now I made towards this, keeping well in the shadow of the hedge. The trees were somewhat scattered, but the underbrush was very dense, and amongst this I hid myself where I could watch the road, and waited. Minute after minute elapsed, and, losing patience, I was about to give up all hope of thus discovering my unknown pursuer, when a stick snapped sharply near by, and, glancing round, I thought I saw a head vanish behind an adjacent tree; wherefore I made quickly towards that tree, but ere I reached it, a man stepped out. A tall, loose-limbed fellow he was, clad in rough clothes (that somehow had about them a vague suggestion of ships and the sea), and with a moth-eaten, fur cap crushed down upon his head. His face gleamed pale, and his eyes were deepsunk, and very bright; also, I noticed that one hand was hidden in the pocket of his coat.

And, with the glance that showed me all this, I recognized the Outside Passenger.

CHAPTER XVII

HOW I TALKED WITH A MADMAN IN A WOOD BY MOONLIGHT

"GOOD evening sir!" he said, in a strange, hurried sort of way, "the moon, you will perceive, is very nearly at the full to-night."

"Why do you stand and peer at me?" said I sharply. "And why have you followed me all the way from Tonbridge?"

"Sir, I am a shadow cast by neither sun, nor moon, nor star, that moves on unceasingly in dark as in light. Sir, it is my fate (in common with my kind), to be ever upon the move—a stranger everywhere without friends or kindred. And I peer at you, sir, because I wished to make certain what manner of man you were before I spoke, and though the moon is bright, yet your hat-brim left your face in shade."

"Well, are you satisfied?"

"So much so, sir, so very much so, that I should like to talk with you, to—ask you a question," he answered, passing a thin, white hand across his brow.

"A question?"

"If you will be so obliging as to listen, sir; let us sit awhile, for I am very weary." And with the words he sank down upon the grass. After a momentary hesitation, I followed his example, for my curiosity was piqued by the fellow's strange manner; yet, when we were sitting opposite each other, I saw that his hand was still hidden in the pocket of his coat.

"Perhaps, sir," said he, in his nervous, hurried manner, "perhaps you would be better able to answer my question were I first to tell you a story—an ordinary, a very commonplace one, I fear, but with the virtue that it is short, and soon told."

"My time is entirely my own," said I, leaning against the tree behind me; "proceed with your story."

"First, then, my name is Strickland—John Strickland!"

Here he paused, and, though his head was bent, I saw him watching me beneath his brows.

"Well?" said I.

"I am a supercargo."

Again he paused expectantly, but seeing I merely nodded, he continued:

"Upon one of my voyages, our vessel was wrecked, and, so far as I know, all save myself and six others—four

seamen and two passengers—were drowned. The passengers I speak of were an old merchant—and his daughter, a very beautiful girl; her name was—Angela, sir."

Once again he paused and again he eyed me narrowly.

"Well?" said I.

"Well, sir," he resumed, "we seven, after two miserable days in a drifting boat, reached an island where, that same night, the old merchant died. Sir, the sailors were wild, rough men; the island was a desolate one from whence there was seemingly no chance of escape, and this girl was, as I have said, very beautiful. Under such conditions her fate would have been unspeakable degradation, and probably death; but, sir, I fought and bled for her, not once but many times. Day after day, and night after night, I watched for an opportunity to escape with the boat, until at last, one day while they were all three gone inland, with the girl's help I managed to launch the boat, and so stood out to sea. After three days' buffeting at the mercy of the seas, we were picked up by a brig bound for Portsmouth, and, six months later, were in England. Sir, it is impossible for a man to have lived beside a beautiful woman day by day, to have fought for and suffered with her, not to love her also. Thus, seeing her friendless and penniless, I wooed and won her to wife. We came to London, and for a year our life was perfect, until, through stress of circumstances, I was forced to take another position aboard ship. Well, sir, I bade farewell to my wife, and we set sail. It was a year before I saw my wife again. At first I noticed little difference in her save that she was paler, but, gradually, I came to see that she was unhappy. Often I have wakened in the night to find her weeping silently."

"Oh sir!" he broke out, "I do not think there is anything more terrible than to witness in one we love a sorrow we are unable to reach!" Here he paused, and I saw that the sweat stood out upon his brow, and that his hand was tight clenched as he drew it across his temples. "At last, sir," he went on, speaking once more in a low, repressed tone, "returning home one day, I found her—gone."

"And she left no trace—no letter—?"

"No, she left no letter, sir, but I did find something—a something that had rolled into a corner of the room."

"And what was that?"

"THIS, sir!" As he spoke, his burning eyes never leaving mine, he thrust a hand into his bosom—his left hand, for his right was where it been all along, hidden in his pocket—and held out to me a gold seal such as gentlemen wear at their fobs.

"Take it!" said the man, thrusting it towards me; "look at it!" Obediently I took the trinket from him, and saw that a letter was engraved upon it, one of those ornamental initials surrounded by rococo scrolls and flourishes.

"What letter does it bear?" asked the man in a strangled voice.

"It looks like the letter 'Y,'" I answered.

"The letter 'Y!'" cried the man, and then, with a gesture sudden and fierce, he snatched the seal from me, and laughed strangely.

"Why do you laugh?" said I.

"To be sure," said he harshly, "the light might be better, and yet—well! well! my story is nearly done. I lived on in my lonely house from day to day, and month to month, hoping and waiting for her to come back to me. And

one day she did come back to me—just about this hour it was, sir, and on just such another evening; and that same night—she died."

"Heavens!" I exclaimed. "Poor fellow!" And, leaning forward, I laid my hand upon his knee, but, at my touch, he drew back with a look so evil, that I was startled.

"Hands off!" said he, and so sat staring at me with his smouldering eyes.

"Are you mad?" said I, and sprang to my feet.

"Not yet," he answered, "no, not yet, sir." Here he rose, and stood facing me, and I noticed that one hand was still hidden in his pocket, and, thereafter, while I listened to him, I kept my eyes directed thither. "That night—before she—died, sir," he continued, "she told me the name of the man who had destroyed her, and I have been searching for him ever since. Now, sir, here is my question: If I should ever meet that man face to face, as I now see you, should I not be justified in—killing him?"

For a moment I stood with bent head, yet conscious all the while of the burn-eyes that scanned my face, then:

"Yes," said I.

All at once he turned about, and walked unsteadily five or six paces. Now, as I looked, I saw him suddenly draw his hand from his pocket, then as he wheeled, I knew, and hurled myself face downward as the pistol flashed.

"Madman!" I cried, and next moment was on my feet; but, with a sound that was neither a groan nor a scream, and yet something of both, he leapt into the thickest part of the underbrush, and made off. And standing there, dazed by the suddenness of it all, I heard the snapping of twigs grow fainter and fainter as he crashed through in headlong flight.

CHAPTER XVIII

THE HEDGE-TAVERN

TWIGS whipped my face, thorns and brambles dragged at my clothes, for the wood grew denser as I advanced, but I pushed on, heedless of what direction I took. But, as luck would have it, I presently blundered upon a path which brought me out very suddenly into what appeared to be a small tavern yard, for on either hand was a row of tumble-down stables and barns, while before me was a low, rambling structure which I judged was the tavern itself. I was yet standing looking about me when a man issued from the stables upon my right, bearing a hammer in one hand and a lanthorn in the other.

"Hallo!" said he, staring at me.

"Hallo!" said I, staring at him.

"You don't chance to 'ave a axle-bolt about you, I suppose?"

"No," said I.

"Humph!" he grunted, and, lowering his lanthorn, began searching among the cobblestones.

"Is this it?" I inquired, picking up a rusty screw-bolt at my feet.

"Ah!" said he, taking it from me with a nod, "know'd I dropped it 'ere some'eres. Ye see," he went on, "could n't get another round 'ere to-night, and that cussed axle's got to be in place to-morra."

"Yes?" said I.

"Ah!" nodded the man, "chaise come in 'ere 'arf-an hour ago wi' two gentlemen and a lady, in all sorts of a 'urry too. 'Mend this axle, me man, says one on 'em. 'Can't be done, my lord,' says I, 'not no'ow, me lord,' says I. Well, after cussin' 'itself well-nigh black in the face, 'e orders me to 'ave it ready fust thing to-morra, and if you 'ad n't found that there bolt for me it would n't 'ave been ready fust thing to-morra, which would ha' been mighty bad for me."

"Can I have a bed here, do you think?" I inquired.

"Ah," said he, "I think you can."

"For how much, do you suppose?"

"To you—sixpence."

"Why, that seems reasonable," said I.

"It are," nodded the man, "and a fine feather bed too! But then, Lord, one good turn deserves another—"

"Are you the landlord, then?"

"I be; and if you feel inclined for a mug o' good ale—say the word."

"Most willingly," said I, "but what of the axle?"

"Plenty o' time for th' axle," nodded the landlord, and setting down his hammer upon a bench hard by, he led the way into the tap. Finding myself very hungry, the landlord forthwith produced a mighty round of beef, upon which we both fell to, and ate with a will. Which done, I pulled out my negrohead pipe, and the landlord fetching himself another, we sat awhile smoking. And presently, learning I was from London, he began plying me with all manner of questions concerning the great city. At length, bethinking him of his axle, he rose with a sigh. Upon my requesting to be shown my room, he lighted a candle, and led the way up a

START THE STORY HERE

AFTER bringing a chance companion the news of his restoration to fortune, and hearing from him of the beauty and virtue of Lady Helen Dunstan and Lady Sophia Sefton, Peter Vibart goes on his way. Since Lady Helen is loved by his vagabond friend, and he himself has been bidden woo and win Lady Sophia, Peter has much to think about. He has also discovered that he very strongly resembles his dissolute cousin, Sir Maurice, who many men he has met have cause to hate. He has forgotten that the outside passenger on a passing coach has also stared after him very fixedly.

somewhat rickety stair, along a narrow passage, and throwing open a door at the end, I found myself in a fair-sized chamber with a decent white bed, which he introduced to my notice by the one word, "feathers."

"And so the Tower o' London ain't a tower?" he inquired.

"No," I answered; "it is composed of several towers surrounded by very strong, battlemented walls."

"Ah—to—be—sure," said he, "ah, to be sure! And me 'ave allus thought it was a great big tower standin' in the midst o' the city. Humph—not a tower—ha! disappointin' I be. Humph! Good night, master. Disapp'inted I be—yes." And having nodded his head ponderously several times, he turned and went ponderously along the passage and down the stair.

AT the end of my chamber was a long, low casement, and, drawn thither by the beauty of the night, I flung open the lattice and leaned out. I looked down upon a narrow, deeply-rutted lane, and I was idly wondering what fool had troubled to build a tavern in such a remote, out-of-the-way spot, when my ears were saluted by the sound of voices. Now, immediately beneath my window there was a heavy porch, low and squat, from which jutted a beam with a broken sign-board, and it was from beneath this porch that the voices proceeded, the one loud and hectoring, the other gruff and sullen. I was about to turn away when a man stepped out into the moonlight. His face was hidden by his hat-brim, but from his general air and appearance I judged him to be one of the gentlemen whose chaise had broken down. As I watched him he walked slowly round the angle of the house and disappeared. In a little while, I drew in my head from the casement, and, having removed my dusty boots, together with my knapsack and coat, blew out the candle, and composed myself to sleep.

Now it seemed to me that I was back upon the road, beside the great oak-tree. And, as I watched, a small, hunched figure crept from the jagged opening in the trunk, a figure with a jingling pack upon its back, at sight of which I turned and ran, filled with an indescribable terror. On I sped faster and faster, but with the Tinker ever at my heels, until I had reached this tavern; the door crashed to, behind me, only just in time, and I knew, as I lay

(Continued on page 348)

Color Your Butter

"Dandelion Butter Color" Gives that Golden June Shade and Costs Really Nothing

Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade to bring you top prices. "Dandelion Butter Color" costs nothing because each ounce used adds ounce of weight to butter. Large bottles cost only 35 cents at drug or grocery stores. Purely vegetable, harmless, meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Tasteless.

Making an Herb Garden

Adelaide Utter Describes Its Possibilities

GROWING herbs for market, both for medicine and cookery, is a pleasant and profitable occupation that should appeal to garden-loving women near large cities. The herbs with their foliage of varied green, the vivid colors of such plants as the rose mallows, the blue chicory, the crimson bergamot, purple and mauve hyssop-bloom, and the exquisite lavender, are all as attractive as any garden flowers.

Fascinating as are the possibilities of beauty in the herb garden, however, it is more to the point to tell of growing the herbs, for which there is a greater demand in the highly equipped kitchen and the pharmacist's laboratory than the average gardener realizes.

Parsley, without doubt the most popular hardy herb for market, is easily grown from seed. While the fern-leaved variety is the daintiest, the moss-curved is the kind almost exclusively grown for commercial purposes. To grow parsley successfully from seed, ground open to sunshine should be chosen, the soil carefully enriched, well worked and made fine and smooth; and the seeds, which germinate slowly, are all the better for being soaked over night in warm water. Sprinkle them thinly over the surface. I do not cover them at all. Many small seeds are lost by too deep planting.

How to Handle Parsley

Parsley for commercial purposes is grown in rows. Plant in the fall or very early in the spring. Parsley is a biennial, forming rosettes the first year and the next throwing up flower stalks and producing an abundance of seed. To have a constant supply it should be planted each year. As it is a gross feeder, a slight dressing of nitrate of soda aids the growth of fine, dark green leaves. Be careful in applying the nitrate not to get it on the leaves, for it will burn them. Thin early in May to two inches apart and when the plants begin to crowd, remove every other plant. These can be bound in small bunches and sold. The roots are left on these small plants, about six being used to make a bunch. The plants should be ready for the first cutting of leaves by mid-summer; when they are cut they are made up into bunches of from ten to fifteen stalks.

While parsley is in demand for a garnish, it is also used in dressing for poultry, veal and fish, and for seasoning stews, soups and sauces. The best way to dry it is to dip quickly into boiling water, then hang in a cool, airy place, after which bottle for winter use.

Have Mint Ready in the Spring

Next to parsley come the mints. Although there are ten varieties, every one of which is valuable in the herb garden, the two for commercial growing are spear- or lamb-mint and peppermint. Spearmint is such an adaptable little plant that the cuttings may be planted in any spare corner where there is plenty of moisture and they soon thrive and multiply vigorously. There should be several beds to provide against rust, transplanting every third year, dividing the roots in spring or autumn, but taking care that there is a great harvesting of bunches during spring-lamb season. It is hardly worth while to grow peppermint for market unless a large plot of ground is available, but it is invaluable for many home uses, and is a fine money crop when marketed in quantity.

Sage is always in demand for dressing and can be grown anywhere from seed. Holt's Mammoth, however, which is the best variety, does not produce seeds and must be grown from divisions, layers, or cuttings. Seed is sown in drills at the rate of two seeds to the inch and should be lightly covered. Those growing sage commercially usually start it in nursery beds, transplanting it to follow early peas and cabbage. The small plants are spaced six to eight inches apart and when they begin to crowd are thinned, those taken out being marketed. In this way there is a succession of bunches from August until November. If not cut too closely at the end of the season the plants will live through the winter and can be divided and reset for another year's crop.

For drying, the leaves should be cut when the flowers appear.

Thyme, all the varieties of it, is well worth growing commercially, and no plant adds more balmy fragrance to the herb garden. It does best on a dry, light soil with plenty of sunshine, and can be grown from seeds, cuttings, layers and divisions. The seeds are small and should be sown lightly and just pressed into the ground with a board. It is best to plant seed in a small bed where it can be carefully looked after, and for market purposes thyme should be transplanted much like parsley.

Herbs Not So Well Known

Savory is a fine herb for the rocky corners of the garden, and with marjoram, which should be planted in wide drifts for its charming masses of pink and white blossoms, will meet with a ready sale in many markets.

One of the most charming herbs in my garden is the Sweet Basil, which flowers marvellously in a light, rather rich soil, in full sunshine. Its clove-like flavored leaves are much used in French cookery, and add just the right spicy tang to sauces, ragouts, and to many charming summer drinks.

Another herb which no one would be without, once it is known, is the blue-blossomed borage. The rough green leaves which our grandmothers crystallized give a grateful flavor to summer drinks, and the blue flowers are always covered with tipsy bees.

Tarragon, too, must not be omitted from the herb garden. It adds a delightful flavor to vinegar for salads.

Among the herbs to which we give space in our gardens for the home medicine cupboard, and which can also be sold to pharmacists or chemists, is the pretty grey-green horehound, used in a syrup or confection for coughs and colds. Squills, that charming wild-flower of the Cornish coast, which our grandmothers used to coddle among their plants for its pure blue blossoms, furnishes from its bulbs the familiar syrup that is used in half a dozen cold medicines. The saffron crocus, which has furnished a vivid dye harmless enough to be used through generations for coloring cakes, butter and beverages, is both useful and salable for all these purposes, as well as for coloring lace curtains and linens.

The Science of Gathering and Drying

Many of the herbs which we grow for their color, such as the crimson bergamot and the white and crimson-flowered valerian, we can also range with the commercial herbs; the bergamot oil is wanted in many perfumes and the oil of valerian is valuable for nerve medicines.

The gathering and drying of herbs and seeds is a part of the work that women gardeners enjoy and do with exquisite care. Lavender flowers, of course, must be gathered just before they open. The sweet basil, sage, marjoram, savory and thyme, should be gathered as soon as they mature, dried in the shade, put in the open air, and when they are ready for the store-closet, are better packed in labelled bottles or jars.

Developing an herb garden is such a fascinating process that the American woman who tries it is sure to keep on enlarging her list of herbs, she finds out how slow we are in this country in using a full variety of herbs in cookery, medicines, perfumes and beverages. Besides the substantial profit that may be earned from herbs, given patience and skill in growing them, the study of blending colors and perfumes in the herb garden are two of the many delights it has to offer.

OF COURSE it is. One application of Gombault's Balsam quickly relieves the most stubborn pain. A second use and you're well again, feeling sound as a dollar.

If you have a lame back, stiff neck, cut, bruises, strain or sprain, sore throat, bronchial cold, muscular or inflammatory rheumatism, sciatica or lumbago, get a bottle of Gombault's Balsam today—it will drive out the pain in a hurry.

Safe, healing, antiseptic—this remarkable remedy has been the favorite in many households for a full forty years. Unequalled for external application.

People who have used Gombault's Balsam are never without it. There's no need to suffer if you have it handy.

Sold by druggists everywhere for \$1.50 per bottle, or sent by parcel post direct upon receipt of price.

GOOD FOR ANIMALS, TOO

To Stuff That Turkey

Hints For Cooking, Sewing and Housekeeping

AFTER fifteen years of experimenting, I've concluded that the two best recipes for turkey stuffing are those using oysters and chestnuts.

Turkey with Oyster Stuffing

The Stuffing: Chop twenty small oysters very fine. Add a cupful of crumbs and a few sprigs of parsley for seasoning. Moisten with melted butter.

The Garnishing: For the garnishing about eight large oysters are required. These should be dried thoroughly and each one dipped into a dishful of powdered crackers. After they are well coated, place in a frying pan and cover with hot butter. When they are thoroughly browned they may be taken out and arranged around the turkey. This makes a delicious as well as an attractive garnish.

Turkey with Chestnut Dressing

Wash the turkey out with cold water to which has been added a pinch of soda. Prepare the dressing by shelling a quart of French chestnuts and boiling them for fifteen minutes. After they have boiled this length of time, they must be mashed with the potato masher until they are perfectly smooth. Add a pinch of salt and pepper and two tablespoonfuls of melted butter. Stuff the turkey with this mixture. After stuffing, sew up the bird with basting thread and needle so that none of the dressing can leak out. Put it into double roaster, pour one cup and a half of boiling water around it and proceed to roast according to weight. (Fifteen minutes to the pound.) When the turkey is roasted, remove from pan. Place pan over flame letting the remaining liquid come to a boil and add two tablespoonfuls of browned flour. Boil until it thickens, add water and season according to taste. Pour into gravy dish or over the turkey as desired.—I. R. HEGEL.

bacon and add a little sugar to soup. Very delicious prepared this way.

* * *

Salt put in before cooking will be ruinous to the flavor of meats. They should be partly cooked before seasoning.

* * *

When peeling onions, hold them under water or over the fire and there will be no smarting eyes.

The Broad Highway

(Continued from page 346)

there, that he was standing outside, in the moonlight, staring up at my case-ment with his horrible, dead face.

Here I very mercifully awoke, and lay, for a while, blinking in the ghostly radiance of the moon, flooding in at the window directly upon me. Now as I lay, there leapt up within me a sudden conviction that somebody was indeed standing outside in the lane, staring up at my window. Moved by a sudden impulse, I rose, and, cautiously approaching the window, peered out. And there, sure enough, his feet planted wide apart, his hands behind his back, stood a man staring up. His head was thrown back so that I could see his face distinctly—a fleshy face with small, close-set eyes and thick lips, behind which I caught the gleam of big, white teeth. As I looked, I recognized him as the slenderer of the two "Corinthians" with whom I had fallen out at "The Chequers." Hereupon I got me back to bed, drowsily wondering what should bring the fellow hanging about a dilapidated hedge-tavern at such an hour. But gradually my thoughts grew less coherent, my eyes closed, and in another moment I should have been asleep, when I suddenly came broad awake and listening, for I had heard two sounds, the soft creak of a window opened cautiously near by, and a stealthy footstep outside my door.

DO YOU KNOW THAT—

Peroxide will remove stains from white kid gloves and shoes.—Mrs. W. H. H., Va. * * *

Use coffee in stove polish and it will not burn off so quickly. * * *

Vegetable soup is a favorite. Season it with a piece of salt pork or smoked

SIMPLE PATTERNS MAKE SEWING PROBLEMS EASY

No. 1885 is the "one-piece, one-hour dress." There are only the sides to sew up, the neck to finish and the skirt to hem, and presto! Your dress is finished. The pattern comes in 3 sizes, small, medium and large. The medium size takes 3 yards 36-inch material. **Price 12c.**

The embroidery, which adds considerably to its attractiveness and which can be done very quickly, is included in Pattern 661, also 12c.

No. 8859 is a simple, serviceable blouse for a boy. It can be made with long or short sleeves. The pattern cuts in sizes 6, 8, 10, 12 and 14 years. Size 8 takes 1½ yards 36-inch material. **Price 12c.**

No. 1799 is a one-piece house dress made to close on the left shoulder. The short sleeves are seamed on the shoulders and they are cut in one with the side body. **No. 1799** comes in sizes 36, 38, 40, 42 and 44 inches bust measure. Size 36 requires 2½ yards 36-inch material with ¾ yards contrasting. **Price 12c.**

To Order: Be sure your name and address, pattern numbers and sizes are clearly written. Send to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City, with correct remittance. Add 10c. if you want our big Fall and Winter Style Book, packed full of smart designs.

Remember the Strangers

An Idea For a Novel Thanksgiving Dinner

LAST year, when sister and I were lamenting the fact that the family were so separated that we could not have the usual Thanksgiving gathering, she suddenly remarked that we ought to be ashamed of ourselves—there were so many people who would be thankful just to come out to the farm for a day!

So we put our heads together and sent invitations to people so far from their homes that it would be impossible for them to go there for the holiday. and, of course, this made a rather mixed crowd which somehow made it all the more enjoyable.

To avoid any chance of formality creeping in to spoil our fun, as soon as each guest arrived, he or she was introduced and given a little blue gingham apron. There were eighteen guests and these we divided into three groups—six to help get dinner, six to plan a program and six to make place-cards, favors and prizes.

Meeting at two o'clock there was plenty of time for all this before the four o'clock dinner. My sister bossed the kitchen "help," having everything well planned beforehand and I gave out materials and suggestions to both the other groups to make sure that these would carry on.

Individual Talent Comes Out

It didn't take long for that crowd to get acquainted. The middle aged bachelor from sister's office made as fine a cook as you'd want, while the rather sad-faced girl from our village had more cute ideas for the favors and games than one ever would have thought. A supply of cardboard, pumpkin seeds, small chrysanthemums, raisins and marshmallows, odd little toy novelties from the ten-cent store, crepe paper and toothpicks gave ample material for the placecards, favors and prizes. No one was allowed to know anything that was going on in another group, as they were placed in different rooms to work. In this way we worked up a great deal of curiosity and interest. Laughter and odd noises constantly came from behind the kitchen door as the potatoes were mashed, celery stuffed, salad made, cream whipped and coffee ground. Both my sister and I were assured that if you want to make people happy, let them have a part in the fun making—keep them busy and no ugly silences and stiffness can creep in to spoil the party!

To show our guests that while we lived on a farm we still knew how to serve a dinner, we planned some dishes which would not be expected outside of a good hotel. Our menu was:

Lobster Cup Roast Turkey
Mashed potatoes, string beans in milk,
Stuffed celery, onions au gratin,
cranberry mold
Pear salad

Individual mince pies with
frozen custards
Nuts Coffee

We make the Lobster Cup from canned lobster, but we found it very good. We shredded the meat and half filled glass cups and over the lobster we poured a vinegar and oil dressing brightly colored with paprika. The turkey was roasted with the old fashioned bread dressing into which we had cut part of the giblets and folded two well beaten eggs. The mashed potatoes were left plain but beaten until they were like foam, then reheated and served lightly brown from the oven. Mother's own canned string beans were simmered ten minutes in milk well seasoned. The celery strips had been washed and laid in cold water over night. For the filling we worked cream cheese until soft, adding a tablespoon of finely chopped spiced pickle to each cup and spreading smoothly into the celery.

Onions and Cheese Popular

Onions au gratin proved a favorite in spite of the fact that they are usually refused because of their strong odor. We cooked the smallest, whitest ones we could get in salted water for half an hour, poured off the water and added fresh to cook fifteen minutes

more. This removed much of the strong taste. A white sauce was made of flour, butter and rich milk and poured over them. Then, slices of strong cheese was placed generously over the top, cracker crumbs dusted over all, and the dish browned in the oven. This we served from the dish, although, had we had more table room, this would have been served in individual ramekins.

Cranberry is always so pretty that it brightens any meal. Ours was made very stiff, the berries left as nearly whole as possible. A dash of clove and cinnamon was cooked in at the last and the sauce molded in long narrow glasses from which we turned it and sliced the portions, serving them on platters with the stuffed celery, several platters to our long table.

After so heavy a meal a light salad is always welcome. Mother's canned pears gave us the foundation. These we chilled thoroughly as we did the lettuce hearts on which we served them. The dressing was made of chopped red cherries and butternuts mixed with the cherry juice, a tablespoon of lemon juice, half a cup of olive oil and paprika.

Mince pie is usually a sure bet and so is frozen custard, so, instead of serving a lot of the usual desserts, we made individual pies and on each plate served molds of frozen pudding in which there were currants, nuts and chopped citron!

After the Dinner, Some Fun

It is needless to say that it was long after six when we lingeringly got up from our coffee and nuts and we were then ready for some quiet games.

During the evening the rugs were rolled back and the victrola started, dancing alternated with stunts—silly but none the less laughable—recitations, dancing and imitations. A Paul Jones preceded the last bit of fun, which was a mock trial in which the quiet, tall girl from across the street was tried for eating the turkey placed on Fat Bailey's plate. The judge and jury and the lawyers were all dressed for the part in aprons, veils, hats, and brooms found in the house. They judged her guilty and she was sentenced to make sandwiches and coffee with Fat Bailey.

And it was midnight when the last guest left, everyone voting the "far, far from home dinner" a great success. Try it on some lonesome friends this year on your farm, or if the church or club wants to do something suitable to the day, urge them to hold just such a party, each member to bring a stranger. Giving of oneself is far greater than giving material things and there are many, many hungry hearts—hearts which long to play and to forget for just a little while. Help them to do so!—EFFIE MAURINE PAIGE.

OPENING UP A CITY MARKET

This is the story of a fruit cake that I sent to a friend last November for a Christmas present. Immediately I received a letter asking if I would make a couple more for friends of hers.

Then I had to admit that I did not make that particular cake, but it started a little business for the woman who did. Seven fruit cakes she made and sent by parcels post to that neighboring city before Christmas. Many women who work in the city prefer home-made cake that they can be sure contains no impurities, but they do not care to take the risk of one not turning out well or do not have time to make cakes themselves.

My friend thus got in touch with women to whom she sent dressed chickens and butter as long as the season permitted. This summer she is making dozens of jars of preserves, mixed pickles, catsup, and spiced apples for her "city trade."—MRS. R. G. ARMSTRONG.

Your fashion magazine is one of the best I ever saw and a wonderful help in planning wardrobes. It is always so sensible.—MRS. LULU McDONALD, Memphis, N. Y.

Your Bargain Book Will Fill Your Christmas List for Less

THIS great Catalog of The Charles William Stores, Your Bargain Book—the modern

Santa Claus, offers you tens of thousands of practical suggestions for your Christmas shopping.

No matter whether it is toys, games, musical instruments, jewelry, clothing, novelties or something for the home or farm, Your Bargain Book is sure to have it in a guaranteed quality—and the price will, invariably, be lower than you expect.

Sit down today, make your list now of the gifts you plan to give—do as we have done at the left, put down the Catalog price alongside the usual price asked in the retail stores—then you will know beyond question, that here at The Charles William Stores is the place to do your Christmas shopping. There are no holiday profits added to these low prices. The prices you pay are based on our usual economical methods of merchandising.

Order your gifts early—Christmas will be here before you know it.

Our stocks are now complete. Order now, and let us demonstrate to you the fine service that our customers everywhere are complimenting us on. Make up your Christmas list today.

If you have not already received a Catalog and want to save on your Christmas shopping as thousands of our customers are now doing, clip and mail the coupon below TODAY. It will bring Your Bargain Book at once.

Reviewing the Latest Eastern Markets and Prices

THE THANKSGIVING TURKEY OUTLOOK

HERSCHEL H. JONES

FROM reports of producing sections there has been little rain and very favorable weather during the growing season and the crop is believed to be somewhat larger than last year. Judging from the large consumption of poultry during the entire season and improved industrial conditions there is likely to be an unusually big demand for Thanksgiving turkeys. The probable prices and supply cannot be given with any certainty at the present time, but some of the larger operators and dealers are of the opinion that the New York market, Thanksgiving week will be about 45c for southwestern stock, 47 to 50c for best western and 50 to 55c for Maryland and nearby.

The United States Department of Agriculture reports holdings of last years storage turkeys in the United States on Oct. 1, 1923, at 6,337,000 lbs. as compared with 2,645,000 lbs. on Oct. 1 last year. There has been a considerable reduction in the storage holdings since Oct. 1, probably 1,500,000 lbs. to take care of a very good consumptive demand. The storage turkeys are mostly below fancy and largely of poor to medium grades.

Shipments intended for Thanksgiving market should reach New York not later than Nov. 26. Allowance should be made in timing shipments for delays in transit which are frequent at this time due to congestion.

APPLE DEMAND BETTER

With the gradual cleaning up of the poorer grades of barreled apples that have been on the market in the last few weeks, there was a firmer feeling in the market for barreled apples last week. Baldwins are mostly packed and in storage. Now that they are gone from shipping points buyers are beginning to take a more active interest in shipping point quotations.

Exports have fallen off but the British market has not yet recovered. Latest reports on English sales last week were 18 to 22 shillings per barrel on both Baldwins and Ben Davis, which is equivalent to an average of about \$2.60 per barrel f.o.b. New York. This applies to 2 1/4 inch stock principally.

Wholesale prices at New York were lower on some varieties than at shipping points. Only fancy apples were in active demand. Following quotations represent sales November 8 at New York on A Grade 2 1/2 inch: BALDWIN, \$4; fancy, \$4.25 to 4.50; ordinary, \$3.75. GREENINGS, best, \$6.25 to 6.50; few, fancy, \$6.75 to 7; fair stock \$5.75 to 6; ordinary, \$5 to 5.50. KINGS, \$3.50 to 4; fancy, \$4.50 to 5. FALL PIPPIN, \$5 to 5.50. HOLLAND PIPPIN, \$5 to 5.50. MCINTOSH, best, \$8 to 8.50; fancy, \$8.75 to 9; few, \$9; fair, \$7 to 7.50. HUBBARDSTON, \$3 to 3.50; fancy, \$3.75 to 4. NORTHERN SPY, best, \$5.50 to 6.50; ordinary, \$4 to 4.50. PEWAUKEE, \$3 to 3.50. SUTTON BEAUTY, \$3 to 3.50. TWENTY OUNCE, \$4 to 5. STARK, \$3 to 3.50. WAGNER, \$3 to 3.50.

POTATO MARKET DULL

Heavy supplies of potatoes from Long Island, Maine, New York and other sections came in to the New York City market last week and found most of the buyers on the lookout for bargains. A few cars of Long Islands sold for as low as \$3 per 150-lb. sack at the loading point; bulk \$1.05 per bu. loaded. Some of the large buyers contracted for enough to last until the first of next year.

New York State sold 150-lb. sacks for \$2.60 delivered, a few at \$2.40; bulk \$1.60 to \$1.50 cwt.

Some Michigan potatoes continued to arrive. The buyers in general were not satisfied with the stock and several cars would not pass as U. S. No. 1.

CABBAGE WEAK

The wholesale markets last week were oversupplied with cabbage almost entirely from York State. Shippers were quoting medium Danish in carlots at \$14 per ton loaded; a few cars sold for less.

Domestic cabbage, large size, suitable

for kraut, met a slow demand late in the week due to the cold weather. Many kraut factories have stopped cutting. \$10 per ton loaded was the general quotation.

HAY MARKET VERY STRONG

Hay receipts were very light last week at the 33rd Street yards and very few boat shipments. The market is very strong with \$30 top quotation at Manhattan and \$31 has been reached in Brooklyn for both large and small bales No. 1 hay. Most of the hay received in Manhattan has been of rather poor quality in small bales, a considerable amount being heavily mixed with clover.

VEALS STEADY

Although arrivals of live veals were fairly liberal, the market was firm and the stock moved out readily, bringing \$14 for choice selections and \$12.50 to 13.50 for medium to good grades.

Country dressed veal calves were in lighter receipt, but trade was only moderately active and offerings filled requirements with market only steady at 13 to 15c for prime and 10 to 12c for fair to good.

BUTTER MARKET FIRM

Active trading at the beginning of last week left a very moderate supply of fine and fancy fresh creamery extras available on the market. While some sales of 92 score were made at 52c supplies of fancy butter were insufficient to meet the demand and sellers found little difficulty in obtaining full prices listed.

The shortage, however, will soon be relieved by the arrival of fresh Danish. It is estimated that already some 8,000 to 10,000 casks have been purchased to come here. 1,650 casks of butter arrived Nov. 9 from Copenhagen, considerable of which has been sold in transit at 49 1/2 to 50c, duty paid.

CHEESE MARKET ACTIVE

Trading in the cheese market last week continued improving. Most of the movement was in Daisies at 25 1/4c. Wisconsin markets were weak and it was possible to pick up some lots under quotations.

State flats, whole milk, sold on November 8 at 26 1/2 to 27 1/2c.

FRESH EGGS SCARCE

In spite of the fact that the proportion of strictly fresh eggs has been very limited, and demand firm, quotations have not advanced further. In some instances, however, sales were made at premiums above quotations. Medium grades of fresh gathered met a fair demand.

LONG ISLAND DUCKS FIRM

Although receipts of Long Island ducks were fairly liberal, the demand

was good and supplies moved readily at 29c per lb.

Offerings of fowls were liberal, but there was no surplus of strictly fancy stock which sold at premiums of 1c and in some instances 2c for very fine quality. The market for white leg-horns and chickens, however, was easy, and stock did not work out readily. Some sales were made at concessions of 1c below the market. Roosters continued in light supply.

CASH GRAIN QUOTATIONS

Cash grain quotations on November 9 were as follows:

NEW YORK—Wheat, No. 2 red, \$1.26. Corn, No. 2 yellow, \$1.18 1/2; No. 2 mixed, \$1.09 1/4; No. 2 white, \$1.18 1/2. Oats, No. 2 white, 53c; No. 3 white, 52c; ordinary white clipped, 54 to 55 1/2c. Rye, 77 1/4. Barley, 75 to 80c. CHICAGO—Wheat, No. 2 red, \$1.03. Corn, No. 2 yellow, \$1.01 to 1.02 1/2. Oats, No. 2 white, 43 1/2 to 45 1/2c; No. 3 white, 42 1/4 to 43 1/4c. Rye, 71c. Barley, 55 1/2 to 70c.

Putting Eggs Into One Basket

(Continued from page 337)

The first surveys were made in New York State under G. F. Warren. In these surveys it was found that the diversified farms were making more on the average than the specialized ones. From this a rule was deduced that diversification was far better than specialization. Later other surveys were made, and it was found that in these surveys this rule did not hold.

They have found that in the cotton region the profits from farming depended upon the amount of cotton raised. The greater the amount of cotton the greater the profit. They found in the Freehold area of New Jersey, where the specialty is early potatoes, the more potatoes the greater the profit. In a district where the orange is the special crop, the greater the acreage of oranges, the greater the income. In the corn belt the same rule held for corn.

Now this fact might seem strange to one who had the preconceived idea that diversity is always desirable, but in every case we find that there are certain conditions which explain the apparent failure to conform to the rule. The potato grower in New Jersey had certain conditions which made potatoes the logical crop for him. He had soil perfectly adapted to potatoes, with yields running up to around 300 bushels per acre, a network of railroads, making it unnecessary to haul the heavy and bulky crop far to the shipping point, and the world's greatest market at his door.

As to putting all your eggs into one basket, you always put all your eggs into one case. You simply get a good case with good fillers, and the eggs go

to market. You would make a failure of putting them into about sixteen boxes of various kinds and a few into paper bags. You would be sure to lose a lot of them, whereas, if you put them into one case, you make that case strong. If you have more eggs than will go into one case, you use two. You do not go around looking for a new sort of receptacle.

There are advantages to diversity. You usually get a better labor distribution, and you are less likely to be badly stung some year when the breaks are against you.

There are big advantages to specialization too. You need only one outfit of machinery, making the overhead less. You have less trouble in marketing one thing than several. Of course one can carry specialization to extremes. One should not rob the soil, and he should not bite off more than he can chew.

In my opinion, based on a good many years experience, about two or three specialties, so chosen as to fit in well together is far better than a wide diversity, and in this State, New York, is better than a single specialty. See what the most successful farmers in your neighborhood (as shown by the bank account, not the farm buildings) are doing. If you do about the same with slight changes to fit the soil on your farm, you will not be far wrong.

The Apple Exposition

(Continued from page 343)

show that I should eat more apples, but I certainly won't pay fifty-five cents to get into the show in addition to the carfare."

However, the many who did come, could not help but be impressed with the fact that Eastern fruit growing is a great industry and that Eastern fruit is mighty good.

ANNUAL MEETING OF NEW YORK HOME BUREAUS NOV. 20-21

The fourth annual meeting of the New York State Federation of Home Bureaus will be held at the Onondaga Hotel, Syracuse, N. Y., on Nov. 20-21.

CATTLE BREEDERS

Fecundity!

Fecundity, the ability to produce strong, healthy calves regularly, is essential to a profitable dairy cow.

FECUNDITY IN HOLSTEINS MEANS:

Full value from prepotent sires --

Assurance of regular herd increases year after year -- Extra profit from sale of surplus stock --

Regular freshenings and consequent increased milk production for the whole herd -- Larger annual net profits.

Let Us Tell You About Holsteins.

EXTENSION SERVICE,
The Holstein-Friesian Association of America
230 East Ohio Street, Chicago, Ill.

HOLSTEINS**DO YOU WANT**

to add some new HOLSTEIN blood to your registered herd, or do you want to introduce some into a good grade herd?

The Veterans' Mountain Camp offers you this chance. We have on hand eight young bulls, from one to seven months of age, carrying the best blood of the Segis-Burke and Vale strains. All direct sons of De Kol Webb Pontiac. Sold with or without papers.

No reasonable offers refused as this stock must be disposed of at once. Write or wire VETERANS' MOUNTAIN CAMP, HORSESHOE, N. Y.

Concrete on the Farm*Placing Concrete In the Forms and Finishing the Job*

PLACE the concrete in the forms as soon as possible after mixing. Do not allow it to stand for more than 30 minutes after mixing, because soon after water is added to cement the setting action begins. After setting has started, concrete should not be remixed to soften it since the binding effect of the cement has been somewhat lost. It is best to deposit the concrete in the forms in layers about 6 inches in depth, and spade or work it to eliminate the air pockets so that it will settle and form a dense mass. When "spading," the chisel-edged board or spade is moved up and down between the concrete and the side of the forms. Working the concrete in this way next to the forms pushes the large pebbles or stones back from the face of the forms into the concrete and results in a smooth, dense surface next to the forms.

As soon as the concrete begins to set, float the surface with a wood or cork float. Rub the surface only enough to level it, as too much troweling draws the water to the surface, causing hair cracks and a dusty surface. If a smooth finish is desired, trowel with a steel trowel after the concrete is set. Some men of considerable experience make it a practice to sprinkle over the surface of the wearing coat, before it is floated, a dry mixture of equal parts of sand and cement. It is claimed that this practice gives a harder and neater looking surface.

After one day, or preferably two, remove the forms, moisten the concrete with a 1:1 cement paste, and rub it in with a wood float or carborundum stone. This will give a very neat-appearing surface. At this time any holes may be patched with a 1:2 cement mixture. The inside surface is often given a wash of Portland cement and water mixed to the consistency of cream and applied with a brush, to close all pores and insure a water-tight job.

Finished walls will have no smoother surface than the forms. If the faces of the forms were smooth and tight, and the concrete was well spaded, the natural finish of the concrete may be sufficient.

A very smooth finish may be obtained by rubbing down the concrete with a carborundum stone or wood float. As soon as the concrete is hard enough to be self-supporting, remove the forms, chip off the ridges, fill the pockets with cement mortar, and then paint the entire surface with cement paste (1:1) of cream consistency. This is rubbed in with a carborundum stone or wood float, and a smooth surface of even color results.

Protecting Newly Placed Concrete

Setting of concrete is a slow chemical process which takes place in the presence of water. If it is left exposed to wind and sun much of the water necessary to hardening will evaporate and the concrete will simply dry out.

Concrete walks and floors or similar large surfaces should be protected by a covering of wet straw, moist earth or other material which will retain moisture. These materials should not be placed until the concrete has hardened sufficiently to withstand the pressure of the thumb without marring the surface. Keep this covering moist in warm weather by frequent sprinkling for several days. Walls or portions of

By F. G. BEHREND

concrete which cannot readily be protected as described may be covered with moist canvas or burlap. This covering should be kept moist for several days depending upon the weather. Many of the so-called dusty concrete floors were made so by the surface being permitted to dry out too rapidly.

Making Concrete Water-Tight

It has been found, in practice, that if a properly proportioned concrete (1:2:4, 1:2:3) is made of well-graded material thoroughly mixed and after placing is well spaded in the forms and then properly protected and cured that it is unnecessary to add to the concrete any water-proofing material. The secret for obtaining a water-tight concrete lies in the selection and grading of the materials and the mixing, placing and curing of the concrete.

It is better to do concrete work during mild weather as cold weather retards the setting action of cement and freezing injures it. Certain kinds of concrete work, such as making tile, building blocks, etc., can well be done in winter if a suitable place is available in which to do the work and to store the materials and the finished product. The materials must be stored to be sure there is no frost in them. The tile or blocks must be stored to protect them from freezing for at least 48 hours.

If it is necessary to build a foundation or other outside work during freezing weather, the sand and pebbles and water should be heated sufficiently so that when the concrete is placed in the forms it will have a temperature of 80 degrees. The cement need not be heated.

Reinforcement is the term used to describe the steel rods or wire mesh that is placed in concrete to increase its ability to resist bending strains. Like stone, concrete is very strong in bearing loads that are placed directly upon it, but is relatively weak when subjected to strains that tend to bend it or to pull it apart. Reinforcement of steel rods or wires are placed in the concrete to increase its power to resist those strains.

Reinforcement Must Be Placed Properly

To be of value the steel reinforcement must be placed in the correct position; that is, in that part of the concrete where it will be most effective in resisting the pulling or bending strains. For example, in a concrete beam, the reinforcement is placed near the lower side as that is the side which tends to pull apart when the beam is loaded. It is recommended that important or elaborate structures, such as floors above ground, beams, columns, retaining walls, silos and other buildings be built from approved designs or be specially designed by an experienced engineer.

It is very necessary that the steel reinforcement be placed accurately in position before concrete is deposited in the forms and tied firmly in place by wire hoops or ties twisted around them.

"I have taken the American Agriculturist for nearly fifty years and I was a subscriber when it was a monthly paper. I cannot do without it."—Harry Walrath, 15 New Street, St. Johnsville, N. Y.

TRAPPERS—Ship To**DORMAN**

There are over 500,000 shippers in North America and thousands ship to us Year after Year.

Good reasons—we pay top prices, give best New York grading, send returns same day we receive shipments. We pay parcel post and express charges. No commission deducted.

If you want a good house to ship to this season, write now for price list. Don't delay.

The Up-to-Date Farmer is also an Up-to-Date Business Man

THE farmer who writes his letters on the Underwood Portable stamps himself as an alert, progressive, up-to-date business man. Just as important, he saves his own time and energy.

It takes surprisingly little practice for any man or woman to write rapidly and neatly on the Underwood Portable. This compact, handy little machine is specially designed and built for home use—use by people who never studied typewriting or went to business school. Into its

sturdy construction go all the experience and skill of the makers of the world's Standard Typewriter.

The Underwood Portable not only writes letters, but is a great help when it comes to making out orders, reports, tax returns, and all the other records that are a part of farm management today. Underwood typewriting is compact, readable and permanent. And it's useful to have carbon copies of everything you have written.

UNDERWOOD TYPEWRITER CO., INC., Underwood Building, New York City

UNDERWOOD PORTABLE

PRICE, \$50
in the United States

The Portable is obtainable
at Underwood offices in
all principal cities, or
direct by mail.

Cased:
Weight 9 $\frac{3}{8}$ lbs.
Height 4 $\frac{7}{8}$ inches

The Outlook For Eastern Sheep Men—By Mark J. Smith

Selling Eggs Through Cooperation

What the Egg Market Demands and Gets—A Radio Talk

By H. B. WALKER

Manager, Atlantic Coast Poultry Producers' Association

I AM to speak to you briefly to-night about eggs and egg marketing. Probably most of you eat eggs and some of you produce and sell eggs.

Greater New York consumes a great many eggs—something like ten-million cases, or

"One-half is he of all the flock"—Adams

300-million dozens a year. These eggs come from all parts of the United States and some from Europe and even as far away as China.

Most of the eggs come from the farms in the Middle West and Southwest. They are laid by small flocks of farm hens that are given little attention and are generally farm scavengers, getting most of their living second-handed by following cattle and hogs in the fields. These eggs are gathered from the nests irregularly, are taken to the country store or collected by a country huckster once a week or so, and eventually most of them get into the hands of large firms of packers who candle out the rotten ones and ship the rest in carload lots. These farm eggs, which may be anywhere from a few weeks to a month old or more when they finally get to market, are known to the wholesale trade as fresh-gathered eggs. Most of these are browns or mixed colors.

Now it happens that there are a good many people in New York who like really fresh eggs, and especially fresh eggs with white shells. To supply their demand, a great many people in the Eastern States have in recent years gone into the business of raising white eggs for market. A dozen years ago or more these specialized egg farms were almost unknown, and the scavenger farm flock was our main egg supply. To-day, in the New England States, New York, New Jersey, Pennsylvania, Ohio, Maryland, Delaware and Virginia—in a territory within twenty-four hours of New York by fast express—there are something like 10,000 or more of these commercial egg farms, with probably not less than 5,000,000 hens and representing an investment of \$50,000,000 or more, devoted to the exclusive purpose of producing strictly fresh white eggs for the New York market.

Hennery quality eggs are laid by hens bred for their egg laying qualities and kept confined in sanitary houses and yards, where they are fed on a scientifically balanced ration of whole and ground grains, cooked meat and fish, milk and green vegetation. The flavor of table quality eggs is very closely affected by the feeding of the hen, and these hennery eggs naturally are preferred by particular people to the eggs laid by the scavenger farm flocks which forage their own living. So that the freshest and finest eggs that come to New York are those which come from these nearby commercial farms.

Of course it costs more to produce eggs of this kind. On New Jersey egg farms the cost of feed, taxes, and overhead is about 35 cents a dozen, without any allowance for labor or profit. The Missouri, Oklahoma, or Texas farmer, on the other hand, does not figure that his eggs cost anything, and he sells most of them for less than 20 cents a dozen, which is less than it costs for feed alone on the specialized egg farm.

In the last two years, these nearby egg farmers in several States have formed a cooperative marketing association, under the name of the Atlantic Coast Poultry Producers' Association to protect themselves and the egg-eating public against substitution

weeks, or that has been kept at a temperature of 46 degrees in an icebox for two or three months, is still a fresh egg. These cold storage laws would be bad enough if they were enforced, but efforts to enforce them do not accomplish much.

It is a fact that, under present market conditions in New York, there is probably more fraud in the retail sale of eggs than in any other food product sold. The consumer who wants really fresh hennery eggs and is willing to pay a fair price for them can only depend on the honesty of the dealer. And this fraud and substitution not only robs the consumers but threatens the existence of the commercial poultry industry.

The job that our association has undertaken is to create marketing conditions that will enable the consumers to buy fresh nearby hennery eggs at fair prices the year around, without any fraud or substitution in the transaction, and to secure for the producer a larger share of the price paid by the consumer, which is necessary to meet his cost of production and enable him to remain in business. It is a big job and it can be put over only by the cooperation of both producers and consumers.

* * *

EDITOR'S NOTE—Mr. Walker's radio address is very interesting and valuable because his organization is one of the first and the best in the East to attempt to solve the problem of marketing eggs through cooperation.

The suggestion has often been made that the milk cooperatives, particularly those that own milk plants like the Dairymen's League Cooperative Association, could work out some kind of a subsidiary organization for marketing eggs. There are several advantages claimed for this plan. The cooperative owns plants which could easily give some space for handling the eggs. The eggs could be easily collected through the milk teams, and perhaps some of them at least might be marketed at retail through the dealers' milk wagons and milk stores. Also, most dairy farmers are poultrymen to a greater or less extent.

However, the plan probably would not work,

mainly because it is usually impossible to

(Continued on page 366)

Small flocks like this supply the bulk of the egg supply of our cities

and frauds that have grown up in the egg business in New York.

In the last few years a large poultry business has grown up on the Pacific Coast, in California, Oregon and Washington. Half a million cases, or more than 15,000,000 dozens of eggs were shipped to New York last year from these States, 3,000 miles by railroad freight, or a longer voyage through the Panama Canal. These are all hennery eggs and were fresh when the hens laid them. Of course they are several weeks older when they arrive in New York, but they are all sold as fresh eggs. In the language of the average New York retailer all eggs are fresh, no matter where they come from or how old they may be. We have some very drastic and very foolish laws about cold storage eggs. An egg that has been in a cold storage warehouse at a temperature of less than 45 degrees for 30 days or more must be sold as a cold storage egg. An egg that has been in cold storage in the hold of a ship for several

It doesn't take much effort to get a hen like this

The Outlook For Eastern Sheep Men

In Addition to Wool, the East Can Compete in the Lamb Market

By MARK J. SMITH

THE statement has been made that the standard stereotyped sheep article begins with a howl, contains a presentation of statistics and concludes with a prophecy. All of which is true to a greater or less degree and logically so. The sheep industry has always experienced cycles of a rather pronounced form and until such time when human nature undergoes a very radical change this will continue to go on.

In the fall of 1920 and following winter when sheep owners were making a scramble to get rid of their ewes at almost any price and the interest in sheep was at the lowest ebb that it has been at any time since the war, an old-time sheepman writing in one of our farm papers made the suggestion that there was a possibility of ewe lambs born that spring, bringing \$15 a head before they died of old age—furthermore this man was willing to back up his prophecy by betting a cheap hat on it. In justice to our far-seeing friend I think it should be said that I have before me now a report of a sale of 140 head of two-year-old western ewes that recently sold to a Dansville party at \$15 per head.

When sheep are high farmers want them—when they are low many of them want to get out. The eastern sheep owner is not a sheepman in the same sense as is our western brothers—here the farm flocks are usually sidelines to the farming business and while it is not generally realized one-third of the sheep kept in New York State are owned in six of the best farming counties of Western New York where land is high in price, but where large amounts of feed are raised and the roughage fed. Hence the flocks are large.

However, take it in the Adirondack section of the State where the flocks are small and the farm business usually smaller—here the sheep play relatively as large a part in the farming scheme as in more level sections.

Eastern Sheep Business on Sound Basis

In this article I shall omit the aforementioned howl and shall not assume the rôle of a prophet, but shall present some facts and give the readers of the American Agriculturist the benefit of my experience and contact with the sheepmen of four States. My purpose will be to substantiate the thought that "Eastern farm flock husbandry is on a sound and substantial basis."

There is to-day a world-wide shortage of sheep and wool—for some years before the late war the demand for wool had caught up with the supply. In 1914, in spite of wool being on the free list under Schedule K, wool increased in price over the preceding year

due to the influence of the world-wide scarcity.

Wool is a war-time necessity so that during the World War the demand for it greatly increased with resultant high-level of prices. After hostilities ceased, wool continued strong for a time. Then the demoralization came due to conditions that had practically nothing to do with world-wool supplies, but rather with accumulations in countries of origin, due to shipping congestion and other accumulations made by warring nations looking forward to a war of uncertain length. We must also bear in mind that central Europe was practically out of the wool market

"The eastern sheep owner is not a sheepman in the same sense as is our western brothers—here the farm flocks are usually sidelines to the farming business. . . ."

at that time. This last fact is significant in view of the fact that Germany in 1922, is reported, to have bought from other countries over 400,000,000 pounds of wool—a considerable factor in the wool trade.

As soon as trade conditions again became more normal, wool advanced inevitably due to the conditions of supply and demand.

It may, at first thought, seem out of place to talk so much of wool when discussing the prospects for eastern farm flock husbandry. It is true that the lamb is the big end of the sheep industry in all sections at this time, but the nature of wool—its method of sale and handling gives us a check on the trend of the sheep population. We are a wool-importing nation—importing practically half of our consumption—producing a tenth and using a fifth of the world's wool.

Shoddy Replaces Wool Shortage

There is not enough wool in the world to make a pound of cloth for each person or only a piece of cloth a little over a yardsquare. Shoddy or reworked wool fills in the gap. Someone has said that reworked wool makes up the difference between that which "A Tahitian wears in his Upa Upa dance and

that of the average conservative New Englander."

Sheep have always been the fore-runners of civilization inhabiting the frontiers. In the early days when the West was being opened up and the vast amount of free range was thrown open to sheep grazing the East could not compete and our sheep population fell off by leaps and bounds—just one illustration is that of Dutchess County in New York State. It seems almost incomprehensible that in 1835 Dutchess County had 234,294 sheep and there were twenty counties with over 100,000 head. Dutchess County does not possess 10,000 sheep to-day.

To-day in the United States, we really have no frontier. Nearly three-quarters of the sheep in the United States are kept in the Rocky Mountain States. In recent years, the numbers have declined and with the cutting up of the ranges by homesteads, dry-farming, irrigation and so on they will continue to decline. We are in a new era. In the days gone by sheep were raised in the West for wool alone. With the increasing of our national population, development of cities, improvement of transportation and refrigeration as well as increased costs of running ewes in the West, the western ewes were crossed with rams that would give them more value from the carcass standpoint.

This practice has been in effect, not only in the United States, but also in such important sheep countries as New Zealand and Australia.

Coincident with this change has come increased costs. The old Merino western ewe virtually looked out for herself, but modern western sheep raising calls for more fences, deeded land, modern shed-lambing and more shepherding in general. These items have all added to the cost.

East Can Compete for Market Lamb Trade

The point that I have been coming to is this—to-day, the East can compete with the West in the production of market lambs. A prominent Wyoming sheepman states that it now costs \$5 to run a sheep a year in their State. Thus it can be readily seen that under our eastern farm-flock conditions where we have more of the production factors under control, where our lambing percentages are higher and where much roughage of an inexpensive byproduct nature is consumed that our small farm flocks are relatively more profitable than is the case in the West.

Profit is the golden beacon that guides the course of the man who is planning to get ahead and to-day we are hearing large grain farmers say that they have been following

Are The Sheep Coming Back?

WE were very glad to get for you the article by such an able authority, published on the feature page of this issue, on the sheep industry in New York State. We know of no one better able to discuss this subject than Mr. Mark Smith.

Mr. Smith believes that the sheep are coming back to the East. We agree with him. In fact they are back. This was once a great sheep country. Then as the ranges of the West were opened up, we found that we could not compete and the farm flocks gradually disappeared. The dogs also helped to chase them out.

But now the East has many advantages in sheep husbandry over the West. Land is cheaper, markets are nearer. So the sheep are returning. Strange how all great movements travel in cycles, isn't it?

We do not believe that there should be any rapid change from one type of farming to another. We do not believe that anyone should rush headlong into the sheep business without a careful study of the possibilities. But we do know that there are many thousands of acres better fitted for sheep than for cows.

We believe that there is an opportunity for the man living back in the hills, perhaps too far from a station to deliver fluid milk, to turn his attention back to sheep. Many such men have already reached this conclusion. Because of this growing interest and the great importance of sheep husbandry, American Agriculturist will contain regular, and we hope helpful information on all phases of sheep husbandry and we will be glad to answer so far as we can, all letters asking for information on the subject.

That "Little Red Schoolhouse"

RECENT articles on the Rural School Bill state that under the proposed community plan of rural school administration, the community board of education could temporarily close any district school in the community for one year or longer. This statement is

untrue. As the bill was finally amended in the Legislature, the community board has no power to close any school in the community for a long or a short time. The only way that any school can be consolidated with any other under this bill is by a majority vote of the people in the districts to be consolidated. Furthermore the only way that any school can even be closed for a short time is by that same majority vote of the people themselves in the local district.

This statement is a good example of some of the misinformation that is being circulated against the school bill. We take the stand that if after you thoroughly understand the main provisions of this bill, you do not want it, we hope you will defeat it. But there is much in the bill that is good and we hope that you can balance the good with what you consider the bad points fairly, before you reach your decision, in spite of the efforts to cloud the issue.

The constantly repeated statement that the bill will take away "the little red school house," is in the same class of misinformation as the one that we mentioned above about the community board closing the school. "The little red school house" cannot be taken away under any circumstances, unless you yourself vote for it. On the other hand, the bill provides \$10,000,000 of State aid of which the cities pay 87 per cent, to help you make that "little red school house" even better than it is now for country boys and girls.

A Little Light Ahead

ANOVEMBER 1 report of the United States Department of Agriculture states that there is the best outlook for farmers in four years. The statement reads:

As regards relationship to the community at large, the position of agriculture slowly but surely improved. Purchasing power of farm products, though still handicapped, is now at the highest point in three years. What is more, prices are better at a season when farmers actually have something to sell.

After one of the hardest periods for farm people in the history of American agriculture, it is certainly good to begin to see a little light ahead. We are by no means out of the woods yet. Farm prices are not what they should be and the purchasing power of the farm dollar is still far too low. But it is surely climbing upward a little every month for which we are all duly thankful.

Uncle Sam Goes Berrying

UNCLE Sam Farmer dragged himself wearily out of the tangle of briars in the old slashing and started the three-mile walk across lots home. In his hand he carried a milk pail filled to the brim with blackberries. Back of him trudged Young Sam, lugging another pail which was far from being full.

"Seems 'though," said Old Sam as they paused on a knoll for breath, "that with berries as thick as they were in that patch this mornin' that you could of at least covered the bottom of your pail. What you been doin' anyway?"

"Bottom of my pail is covered," said Young Sam indignantly. "Got at least six quarts. Darn this berry business, anyway. Long comes the only slack time we've had in the farm work this summer and you drag me off to pick berries. Said it would be kind of a vacation—some folks got queer ideas of restin'."

"And some folks are just naturally plumb lazy," growled Old Sam, as he started once more down across the pasture lot.

They came after a time through a patch of woods, to a little spring in its edge, and both of them, sprawling eagerly on their bellies in the mud and stones on the edge, drank their fill of the ice-cold water.

When Uncle Sam arose, he remarked, "Some fool poet has sung at length about the virtue of drinking water from an old oaken bucket; but for me, I'll take the wild water bubblin' out of a hill spring every time, 'specially after trampin' that same old hill in the hot sun for several hours."

Sam made no reply, and the old man continued: "It's a tragedy the way these springs are disappearin'. It's only been a few years since you could find at least one good waterin' trough on almost every mile of country road; but now they are so scarce that they're almost a curiosity."

"Pa, you talk foolish. What good are watering troughs on roads where there ain't no horses?"

"That's all right, son. Maybe the autos have driven the horses off the roads, but there's still cows in the pasture and where there's water troughs there's springs, and where there's springs you'll always find a good cow country. Springs furnish water in the pasture and in the barns, and also you'll notice that a good spring water country is always a good grass country."

"Uh-huh," said Young Sam, slapping at a fly, "More grass means more hay and more cows, and farmers make too much milk now."

"Now this year," continued the old man, paying no attention to the interruption: "many of our springs have gone dry. They have never failed before. Gittin' so it's hard to find a good spring anywhere, and the droughts come oftener and stay longer than they used to. It's all because we darn fools have nearly ruined this country by cutting off the woods. Thirty years ago you could take a pail and go out anywhere within a mile of the house and pick it full in a few minutes of big blackberries from bushes five or six feet tall. Now they're about all gone. When I was a young feller, there was quite a little timber left and it seems 's though the weather was easier to wrestle with too. Yes, sir, the best crops some of these old hills could grow, is just plain woods. Next generation's goin' to find we darned near ruined this country when we stole the trees."

"Boy, what say, we write up to the College of Forestry or to the State Department, or somewhere, and see what we can do 'bout settin' out an acre or so of young pine trees? I understand that it can be done without costing much. What say, son?"

But "son" made no reply. The old man turned around to look at him and then with a snort of disgust, picked up his pail and started down the hill.

Young Sam was fast asleep.

Better Keep It Coming

"Sometimes it seems to us that we have been doing too much bragging about the development of certain romantic and specialized lines in California production."—Editorial in the "Pacific Rural Press."

RIGHT you are, brother! Of course, we all agree with you about the tremendous amount of boasting that has come out of California and other parts of the West, but after all, we don't know but that it has been a pretty good thing for you. To be sure, it has been rather difficult for us Easterners to swallow all that we heard, but there was so much hot air that we could not very well escape getting part of it, with the result that we have bought your apples, oranges and prunes whether we wanted them or not. So you had better not get a sudden access of modesty now, for the farmers in the East are learning to do a little bragging themselves, and if you stop we might get some of our apples or something down the consumers in the place of your oranges.

Keep adding little to little, and soon there will be a great heap.—VERGIL.

What Is Wrong With the Cooperatives?

"Where Withal Shall We Be Led?"—The Second Article on Cooperation

By E. R. EASTMAN

IT always make me a little peeved to hear someone at the beginning of a conference or meeting say something like this: "Now we won't discuss personalities to-day at all. We'll just talk about principles."

At one stroke, he has eliminated the only thing that counts in any proposition or any business under the sun—personalities. If personalities are right, principles are sure to be. Men make principles, and *leaders* make or break cooperatives.

Almost any cooperative organization will make at least some success working on almost any kind of a plan, no matter how poor that plan is, if—but this is one of the biggest "ifs" in the world—the men you have chosen to lead and direct that cooperative are sincere and efficient.

Three types of men seek leadership, or have it thrust upon them in farm affairs.

First, and worst, there is the small calibre, incompetent fellow who gets himself in because the glory of the job appeals to his largeself-importance and egotism, and because those who elect him do their fault-finding after he is elected, instead of before. To this kind of a leader there is also the appeal of a salary, greater by far than he has ever received before. This kind of man will never be anything but a curse and a millstone to all cooperative organizations. I would almost prefer an actual rascal, and I certainly would rather have a selfish politician.

Then there is the natural born politician who sees in cooperative leadership an opportunity to exercise his talent to advance himself and his selfish interests, and an opportunity for the exercise of power which is as the very breath to his nostrils. Strange to say, however, such men often make good leaders, for in selfishly working hard for themselves, they incidentally achieve results for the members. It is an interesting question anyway, whether or not most of the world's progress along every line has not been largely accomplished by men working for their own interests. It is possible for men to be selfish and still to be honest. In fact, we are all selfish to a greater or less degree.

It is also possible for a man to be a politician and still to be honest. But when such men happen also to be incompetent business men of small ability and judgment, and use their political talent to advance and keep themselves in power, then you had better watch out. Better change the politician pretty often, too; otherwise, he will dig himself in for a long term by much red tape so that you cannot change him easily.

Then there is the third type of leader—honest and sincere, with the real desire to serve you as well as himself. You will find this sort of man in large numbers in the beginning of all great movements for mankind. He is apt to be a crusader; he is the sort that goes out and sacrifices his own money and time day after day to advance a cause, whether it be cooperation or something else. Because he will not play politics, he is likely to be crowded out in the leadership of affairs by the real politicians as soon as he has made the job worth while enough to attract their notice. In fairness, it probably ought to be said that some of these good men ought to be crowded out for they are often better crusaders and organizers than they are business men. As I have suggested, the political type frequently achieves better re-

sults after the cooperative gets to operating because they have more skill in business dealing.

These three types of men are the material with which we have to man our public affairs of farmers. Every farmer knows of examples in his own community of each type of man I have suggested; and any farmers' organization of any size has men of each of these three classes among its directors and officers.

Can we take this material, select it, put it into positions of responsibility, mold it, control it, and use it to lead our farmers' business and affairs into a new day in agriculture?

I unhesitatingly answer "yes." After all, you know, it is pretty good material, the best there is—with many faults, imperfections and false places in it, to be sure, but

Watch For These Articles

THIS is the second article of the series on the subject, "What is Wrong with the Cooperatives?" written by E. R. Eastman. In the first article Mr. Eastman outlined various factors that influence the success or mark the failure of a farmers' cooperative. In this issue, Mr. Eastman deals with the type of representative of the farmer who sits on the board of directors of the farmers' organization. It is the director who is the leader and upon whom the farmer depends for much of the success of his organization. In articles to come on the subject: "What is Wrong with the Cooperatives?" Mr. Eastman will deal with other factors that control the success of farmers' cooperatives, such as volume of business, selection of a business manager, salaries of employees. Whether you are directly connected with a cooperative, or not, we are sure you will find this series of great interest and value.—The Editors.

with the good predominating, the best of the many fine things that the good Lord ever made.

Yes, the cooperatives in the main are bound to succeed, if they are well led. They will be well led if the plain farmer gives proper attention to the job of selecting and managing his own leaders and organization directors.

How is he going about it?

First: There must be simple and direct elections in every cooperative, in every local and every central. Let there be no confusing, indirect election methods; let there be no entangling red tape. One of the few inexcusable and foolish mistakes made by the wise fathers of our country was the provision for an electoral college which elects our president. We do not vote for a president in this country; we vote for an elector who votes for a president. What nonsense! Keep it out of the cooperatives. Vote yourself directly for the men who are to represent you.

Second: Nominate your own men. The politicians have always known that the elections are quite apt to take care of themselves. It is the nominations that count. This is especially so when there is only one ticket of officers up, as is the case in the cooperative elections.

Third: Insist on short terms. There is a growing tendency in cooperative work to elect directors for more than one year. There is a good argument for this because it takes about a year for a new director to learn the details of the business so that his judgment on policies and business affairs is good. But unfortunately, it works both ways and if he is the type of man who never will make good as a director, then the farmers are obliged to carry him and his inefficiencies for a long

time. The value of permanency can be had equally well if you send the same man back each year. But I believe that he should be made to return to the members for their very frequent approval, or disapproval.

Fourth: Hold representative mass meetings. These may be brought together at least once a year and special ones for the purpose of deciding very important questions of policy can be called. Such meetings give a delegate from each local first-hand personal information in regard to what a cooperative is doing, increases the interest and enthusiasm for the work, and in a way serves as a referendum in acting on important questions, thus relieving the officers and directors of too much responsibility.

Fifth: Pay your directors and officers reasonable salaries. What is a reasonable salary? There are two ways of looking at it. If a man who has lived to middle age in a farm community and never earned over two dollars a day for himself, there may be some question as to his ability to ever really earn much more than that for anybody else. However, farming is a business of low profits, or none at all, so maybe a two-dollar man would have earned ten dollars had his lot been cast in another trade or profession. Certainly cooperative leaders must cope with highly trained and highly paid men among the dealers. The type of man to do this successfully must be paid fairly well, although it would probably be difficult ever to meet the salaries paid by the dealers because many of their salaries are higher than the service they render justifies. Cooperative salaries certainly must be reasonable. After all, the purpose of cooperation is to increase the farmers' profits. To do this, overhead expenses must be kept at a minimum and salaries is one of the large items of overhead.

It should be said, however, that farmers cannot expect their neighbor, particularly in these times of short help, to neglect his business and thereby lose a lot of money, and live away from his family without properly compensating him for the service. The big job is to get competent men for leaders. Those men cannot be secured without making it worth their while to neglect their own business. I shall have more to say on this salary question when I discuss the cooperatives' "hired men," the employees, in a later article.

Sixth: Never under any circumstances allow a member to be both a director and a salaried employee of the organization at the same time. This statement should not apply of course to the regularly elected officers when executing the duties for which they were elected, and an exception should be made for the director who puts in a few days occasionally on a per diem basis, in doing organization work or looking after the farmers' interests in his own district. No man, no matter how sincere and honest he may be, can represent his district, his local or his members on any board of directors if his judgment or viewpoint is biased by being a employee of that organization at the same time.

Let me illustrate. Suppose a cooperative had twelve directors, and the president and executive committee had the power, as they often do, of hiring and firing employees; suppose that three of the employees are also directors. Now suppose there is a divided

(Continued on page 359)

Crossroads of Conversation

Could the telephone directory in the hands of each subscriber be revised from hour to hour, there would be no need for the information operator. But even during its printing and binding, thousands of changes take place in the telephone community. New subscribers are added to the list. Old ones move their places of business or of residence.

Though their names are not listed on the directory, these subscribers must be connected by the highways of speech with all others in the community. To supplement the printed page, there must be guides at the crossroads of conversation.

Such are the information operators, selected for their task because of quickness and accuracy, courtesy and intelligence. At their desks, connected with the switchboards in central offices, they relieve the regular operators from answering thousands of questions about telephone numbers that would otherwise impede the rendering of service. If they are unnecessarily asked for numbers already in the directory, service is retarded.

"Information" stands for the most complete utilization of telephone facilities.

Sammy Helps Pa Butcher

All Had a Good Time—Except Pa and the Pig

"YEP, we butchered at our house yesterday." Sammy strolled into the shop where I was mending a harness and seated himself on a workbench.

"That so, Sammy, how did you get along with it?" Sammy grinned and I knew there was a story in the background.

"Got along all right after we got started."

"Had trouble getting started, did you?"

"Yep—any way, Pa did." Sammy's grin widened. Sammy resembles a Ford. It takes a lot of persuading to get him to go, but when he once gets started he "rambles right along."

"Have trouble getting the water hot?" I hazarded.

"Nope, Ma tended to that. Got the water hot all right."

"Pig didn't get away, did it?" I questioned desperately. I was beginning to doubt my ability to get Sammy "started."

"Not till after it was dead," and Sammy's grin became a chuckle.

"The pig got away after it was dead! Why, how did that happen?"

"Say, it was the funniest thing you ever saw. I nearly died laffin'. Pa'll skin me, tho, if he knows I told, so don't you say anything." And Sammy looked at me inquiringly.

I duly promised not to say a word, "cross my heart, hope to die," and all the rest of it.

"Well, you see it was this way. Pa got the barrel out and built a platform for it and Ma had the water hot in the boiler. The pig was killed and already to scald when Pa says: 'Sally, that's Ma, I'm going to nail a piece of board on the corner of the shed above the barrel. Then I'll tie a rope to the pig's feet and throw it over the board and we can pull it out of the barrel twice as easy.' Ma looked at Pa and then at the piece of board he was goin' to nail up and said: 'I don't believe that board is strong enough. You had better get a stronger piece.'"

"Of course," says Pa, sarcastic like, "No matter what I do I should do it a little different. I guess I have been nailing boards for the last thirty years, and ought to know when a board is strong enough to hold what I want it to hold."

"Even if you have, there is still a chance that you might be able to learn something. But go ahead, it's your funeral," and Ma went back to tend her fire. Pa nailed on the board and we poured the water in the barrel and got the pig in with a rope on its hind feet. We soused Mr. Pig up and down in the water till Pa thought he was scalded enough, and then he threw the rope over the board and started to pull. It looked like it ought to work all right and I guess it would have if that board had been a little stronger, but just as Pa got to pullin' good and hard the old board she broke. Part of it stayed on the shed but part of it came down and hit Pa square on the bean. Say, it was an awful crack. Pa started dancin' up and down and sayin' things and Ma shooed me out around the corner.

"Shame on you William, such language," I heard Ma say as I went around the end of the crib. By the time I got around on the other side, walkin' slow, Pa had got over it a little and was trying to get the pig out of the barrel. But the pig was stuck. Pa tugged and tugged and then Ma tugged and then we all tugged together, but it was no use.

"I think, William," says Ma, soft and sugary like, "if you had saved a little of the corn for my chickens and not fed it all to the pig, we might have been able to get him out of the barrel." Pa didn't save any corn for the chickens and Ma is pretty sore." Sammy paused and looked at me thoughtfully.

"Say," he asked: "Why is it that it makes a man so darnation mad to have a woman tell him something he has done wrong and talks like butter wouldn't melt in her mouth while she's doin' it? He wouldn't be half so mad if she would turn loose and cuss, or something." Being unable to enlighten Sammy on this subject, he continued.

"When Ma started in about the corn, Pa threw the rope down and said: 'I'll

By E. M. FRUIT

show you that I can get this pig out of here," and he dashed into the barn. 'I wonder what he is going to do now?' said Ma, thoughtful like. She wasn't long finding out.

"In a minute or two Pa came out of the barn with the new pinto he bought of Frank Jackson last week. Pa grabbed the rope that was tied to the pig and tied the other end to the saddle horn. He was goin' to make the horse pull the pig out. He did, too, but he was in too much of a hurry. Instead of starting slow, he hit that wall-eyed Jane a crack with a stick and she made a jump. The pig moved all right. So did the barred and the platform, and Pa moved too when the hot water hit him. By the time Pa got the pinto stopped the pig was out of the barrel, but Pa was about the maddest man you ever saw. When Pa gets fightin' mad he always jerks off his hat and throws it on the ground. This time he threw it on the pig, and jumped onto it himself, and then on and then off, all the time tellin' that pig what he thought of him and all his ancestors and all his brothers and sisters and all the rest of pig creation. Ma watched him a minute and then said to herself, kinda soft like, 'Off again on again, off again on again; he should have been called Finnigan.'"

"All the time Pa was doin' his jumpin' stunt the pinto stood with her head turned watchin' him and getting more and more excited. I knew something was going to happen pretty quick, but I thought Pa'd find it out soon enough so I kept still. Anyway, I wanted to see what would happen. And then I've found it is better not to do too much talkin' when Pa gets real mad. He would rather do it himself. Well, the pinto finally decided she had better beat it, and she did. It happened that just as she started Pa landed on the pig. When the pinto jerked, Pa's feet went out from under him and he came down on his back on the pig with his feet in the air. Say, I wish you could have seen him. You know Pa is pretty fat and he seemed to just about balance on that pig. He certainly got a swift ride before he rolled off. When he did finally fall off he was goin' so fast he couldn't stop rolling till he went clear into the fence corner and Ma's gooseberry bushes. Say, those gooseberry bushes are awful scratchy. I fell into them once myself when I was trying to ride our old brindle cow. By the time Pa got himself out of the bushes and back to the barn Ma and me had the horse stopped and the pig untied and was ready to scrape the side that didn't already have the hair all rubbed off. Ma was beginning to get kinda riled up herself.

"William," she says; she most always calls Pa Will, only when he gets mad like he done this time, then she calls him William, and she says: 'William, I broke the ice in the horse trough. If you will go and dip your head you may be in a condition to help me scrape this hog.' Pa he didn't say nothing, but he put the pinto in the barn and went at that hog like he was some peevish at it. Ma she didn't say nothing more but hummed away to herself as she worked, and every once in a while she would chuckle like she was thinkin' of something funny. Whenever she did that Pa would snort disgusted like and work harder than ever. Ma says Pa ain't got no sense of humor.

"Anyway, we had liver for dinner, but I don't think Pa likes butchering very well."

A CHEAP REMEDY FOR LICE

I have found a very simple and good and cheap remedy to get rid of poultry lice. Go to your local garage and ask the repair man to save the old oil which he draws out of the cars. Take this and put on the roosts and in all places where mites harbor, at least once a month, and you will soon be rid of lice at no expense. To put it on use an old paint brush or punch a small hole in the bottom of a tomato can and direct the stream of oil on the roosts.—W. T. R., Pennsylvania.

The Outlook For Eastern Sheep Men

(Continued from page 355)

the wrong course—just the other day one man said: "We must keep more sheep." A farmer who owns 150 head of breeding ewes has said that he could keep sheep profitably if wool was worth nothing. However this act of generosity will not be necessary. Recently F. J. Hagenbarth, president of the National Wool Growers' Association, in a letter to Secretary Herbert Hoover of the Department of Commerce at Washington, D. C., made the statement that "present level of prices is justified by production costs and general trade conditions in wool." If the price of wool could be stabilized around a price of fifty cents a pound, it would be in keeping with the trend of other price levels.

Here we are 1,500 to 2,000 miles from the regions of surplus lamb and wool production in an industrial, thickly populated section of the country which gives us a natural economic advantage over the western sheepman—our market is at our door. High freight rates take a big toll from the Idaho lamb raiser before his product is to the consuming centers.

"Westerns" Outsell "Natives"

I do not believe that it is common knowledge that after the western lambs have made their long trip, been unloaded and loaded several times and perhaps spent considerable time in a feeding yard outside some main market, they sell for more money a pound than do our "Native" lambs. On the markets, lambs are classed as "westerns" and "natives," the former being those raised west of the Missouri River. Western lambs as a whole are better than our eastern lambs because the western sheepman is a business man and he raises lambs under systematic, uniform, standardized conditions. The painstaking man who produces a select bunch of lambs each year can hardly realize that the undocked, uncastrated lamb is more common among "natives" than is the choice type. James E. Poole, secretary of the Chicago Live Stock Exchange, a man who has watched the trend of live-stock markets at the world's greatest market for the past thirty-five years in a letter to me, said: "We have had a spread of about \$4.50 per cwt. between common and choice lambs and at all times there has been a superabundance of the former, practically all of them natives. This tells its own story. The farmer who raises cull or nondescript lambs has no business with a flock."

How to Beat "Westerns"

Of course the remedy for this is all very plain—place the production of all native lambs on a quality basis and western lambs will have to take second place. This means pure-bred rams and proper production methods.

No great increase in the number of sheep can be expected to take place as long as ewe lambs are so easily converted into ten or twelve dollars a head—a few will be saved by the far-seeing man who is not in need of immediate cash, but the bulk of them will go. The western man is pressed by his banker, as a hang-over of the recent frenzy in sheep, so that he cannot hold as many ewe lambs as he otherwise would. The average age of breeding ewes is high in every State in the country—a couple of years ago the statement was reputedly made that the average age of ewes in Idaho was five years and I doubt if it has been reduced. Young ewes are exceedingly scarce in New York. All factors point to a profitable eastern flock husbandry for some years to come.

What Is Wrong With the Cooperatives?

(Continued from page 357)

question on some policy before the board. Where in all human nature will those employee-directors be most likely to vote—with the president, or with those who may be opposing the president on this particular issue?

Of course, it is perfectly possible for a situation like this to exist for years without doing any harm, but I think it is dangerous nevertheless, and does not

assure the member whose director is an employee an equal representation on the board with the member whose director is also an employee.

Seventh: There must be a larger sense of responsibility. This means a responsibility of two kinds. First, on the part of the best farmers in the community toward accepting offices. One of the troubles to-day with farming is the fact that the best men have too often allowed the little fellows to run their public business. We are gradually working out of that time, for now, I am glad to say, many farmers of great ability and sincerity are working as officers in the cooperatives. Often to the neglect of their own business they have sacrificed much to accept the responsi-

bility of leadership. This must be continued.

Then there must be a larger responsibility on the part of every farmer to insist upon putting competent men in office instead of letting the incompetent put themselves in. If a man never made a success of his own business, how can you expect him to do much better for you?

Then after you have attended your meeting and elected your leaders, stand by them. The habit of not sticking has cost the American farmers millions of dollars. We are sticking together better than we did, but we still have a considerable way to go along this line. We are actually still doing more criticizing of our cooperatives and their leaders

than we are of the dealers. Sad to relate, there are actually some farmers who will take the dealers' word before they will that of their own leaders. All of this talk about "selling out," "graft," and "putting something over on us," about our leaders is rank nonsense, and it hurts the plain farmer more than anybody else, because he puts the sand in the machinery of cooperative progress.

One of the greatest things in the world is our belief in one another, and in human nature. When we fail in that, we certainly have not much of anything left. To be sure, our leaders are not perfect, nothing human ever is, but "In the good old days," the farmer

Barns and Dungeons!

A dark barn is as cheerless as a dungeon. Its gloom makes easy work harder, robs you of time for other things.

Darkness is an enemy, ever ready to lead you into accident—or worse.

Thirty-one years ago science made a wonderful discovery—the way to

banish darkness on the farm. That discovery was Union Carbide. A little mixed with common water makes Union Carbide Gas, which gives the most beautiful and restful light known, and the hottest flame for cooking, ironing, or water heating. 398,000 strong has been the farmers' response!

The Colt "Gas Well" makes this Union Carbide Gas automatically

The Colt "Gas Well" is planted at a convenient place in the yard. It makes Carbide Gas just as needed. Small iron pipe carries the gas to all parts of the house, barn, and other out-buildings. No matches required for lighting. For many years, on thousands of farms in every State in the Union, Colt "Gas Wells" have been taking the gloom out of the morning and evening chores.

With the Colt "Gas Well" on your

Get your Colt "Gas Well" now—take a year to pay

Among the Farmers

League October Price, \$2.42—New York County Notes

THE Dairymen's League Cooperative
Association, Inc., announces that the
gross pool price for October milk is
\$2.42 per 100 pounds. From this gross
price that will be deducted ten cents for
expenses, leaving a net pool price of
\$2.32. Of this amount the Association
will borrow ten cents per 100 pounds on
Certificates of Indebtedness. This leaves
a net cash price to farmers of \$2.22.

The October price compares very
favorably with that received for milk
delivered in September. The net pool
price of \$2.32 is twelve cents better
than the net pool price received for
September milk. Furthermore the net
pool price for October, 1923 is eleven
cents better than the October price in
1922.

NEW YORK COUNTY NOTES

Schenectady Co.—Farmers are busy
pressing hay and doing fall plowing.
Hay is bringing from \$18 to \$20 a ton.
Eggs are 60 cents a dozen; butter 40
cents a pound; oats 50 cents a bushel;
calves 18 cents a pound dressed; hens
22 cents a pound, live weight; potatoes
\$1 a bushel.—J. W. S.

Onondaga Co.—Hubert Young, a stu-
dent of the Jordan High School, was
awarded a prize, given by the Albany
Chamber of Commerce for his essay on
orcharding. The prize entitled him to a
trip to New York City.—Mrs. H. S. R.

In Northern New York

Franklin Co.—We have had excellent
autumn weather and farmers have their
fall work about completed. The Farm
Bureau Manager, L. D. Kelsey, who re-
campaign for new members and as well
as renewals of old membership. Charles
W. Radway of Canton, N. Y., has been
secured to succeed the present Farm
Bureau Manager, L. D. Kelsey, who re-
signed to go to Albany County. Mr.
Kelsey takes up his new position in
Albany County on November 15. All
stock is now in the barns and on winter
feeding. Farmers have the greater
part of their potato crop in storage,
although there does not seem to be
much advance in the market prices.
At present 70 cents is being offered to
shipping points. There seems to be a
number of auction sales of farm prop-
erty and live stock during the past few
weeks.—H. T. J.

Jefferson Co.—We are having plenty
of rain. Wells and springs are again
furnishing an abundance of water.
Quite an acreage of plowing is being
done. Many farmers are using trac-
tors. Many dairies are being tested
for TB. Several have been found in
practically perfect condition. Butter
is bringing 55 to 60 cents a pound;
eggs 60 to 75 cents a dozen; hay \$12
to \$18 a ton. Ensilage is not as good as
usual, unquestionably on account of too
much leafy material and not enough
ears. Young pigs are bringing \$3
apiece. New seedlings look good and
old meadows have grown considerable
this fall. Grass roots yield a good
cover for the winter, where they have
not been pastured too short.—C. J. D.

In the Hudson Valley

Saratoga Co.—Fall weather has been
very favorable for outdoor work. A
large amount of plowing has been com-
pleted. Potatoes are now bringing
\$2.50 to \$3.00 a bushel but the market is
very weak. Apples are scarce and con-
sequently bringing high prices. Light
pork brings \$15 a hundred. There is
very little demand for beef at the
present. Fresh milch cows are bring-
ing \$100 to \$120 apiece, butter 52 cents
a pound, wholesale. Strictly fresh
eggs are bringing from 50 to 55 cents
a dozen. Fifty sheep have been killed
outright in this vicinity this past season
and many more have been maimed and
rendered unfit for use by dogs. So far
only one marauding dog has been
killed. The heavy rains of the week of
November 3rd did a great deal of good,
filling wells and ponds which had gone
dry. Grass and rye are making good
growth.—E. S. R.

Sullivan Co.—We have had a very
early fall. Our first snow flurry came
on the last day of October. Apples are
scarce. Potatoes are bringing a pretty

poor price, \$1.40 a bushel. It seems
that eggs are not to be had at any
price. Butter is 50 cents a pound. To-
matoes made a great crop this year.
Coal has been \$13 a ton right along.
We expect it will go higher. Hard
wood cut in stove length is bringing
\$3.50 a cord delivered. Some lumbering
and mine prop business are operating.
Help is scarce, especially the kind that
works, in spite of the good wages.
Several city families are wintering
here.—Mrs. C. P. M.

In Western New York

Ontario Co.—Up to the middle of No-
vember, we still had excellent weather
to finish up fall work. We have had
a few snow flurries, but the snow dis-
appeared in a day or so. There are a
good many apples for cider being offered
at 50 cents a hundred. Potatoes are
bringing 20 cents to \$1 a bushel; cab-
bage from \$7 to \$10 a ton; eggs 75
cents a dozen.—H. D. S.

Chautauqua Co.—A fall of six inches
of snow has brought outdoor farm work
to a close. However the weather has
been so excellent that practically every-
thing was well cleaned up before the
snow came. There may be a few pota-
toes and apples that have not been
gathered, but none to speak of. We
had a most excellent fall and every
one made most of it. The buckwheat
crop ran considerably below last year.
Some buckwheat was so short it was
not harvested while that which was
harvested yielded very poorly. Fresh
cows and springers are bringing from
\$60 to \$70 a head. There is absolutely
no sale for horses. Potatoes are bring-
ing from 75 cents to \$1 a bushel.
Dressed pork 12 cents. Winter apples
are bringing \$1 a bushel; ciders, 50
cents a cwt.—P. S. S.

Along the Southern Tier

Broome Co.—At this writing No-
vember 10, snow covers the ground
for the first time this season. A great
deal of fall work has been accom-
plished. There are quite a few auc-
tions in this vicinity and a number of
farms are changing hands. Potatoes
made a good crop and are bringing \$1
a bushel, eggs 75 cents a dozen; butter
55 cents a pound, wood finds quite a
sale.—Mrs. L. K. C.

FARM BOYS REGISTER IN CORNELL SHORT COURSE

Registration of 226 students for the
ten-week winter short courses given
at the State College of Agriculture,
Ithaca, N. Y., was practically com-
pleted November 7.

A large share of these students come
from farms and will take courses in
general agriculture, including such sub-
jects as dairying, poultry keeping, ani-
mal husbandry, vegetable gardening,
soils, floriculture, pomology, horticul-
ture, rural engineering and other allied
subjects.

Each of the six Indian Nations of
this State, the Oneidas, the Onondagas,
the Senecas, the Cayugas, the Tus-
caroras and the Mohawks are again
represented by students who expect to
take back the latest information regard-
ing farm practices to their tribes.

FAMOUS COW CELEBRATES FIFTEENTH BIRTHDAY

Glista Ernestine, champion Holstein
cow, owned by the New York State Col-
lege of Agriculture at Ithaca, celebrated
the 15th anniversary of her birthday on
November 12th.

As most folks in this State know, she
is no ordinary cow. She is fed and
milked four times a day. In milking it
is necessary for the attendant to prac-
tically sit on the floor and use a dishpan
instead of a milk pail because her udder
is so large and low.

She may be growing old but she still
has good dairy ideas as is shown by a
recent record. On August 30th she
freshened and was put on test. During
this test from September 5 to 11th in-
clusive she produced 463 pounds of milk
and 29.72 pounds of butter from 23.773
pounds of fat.—I. W. I.

A SQUARE DEAL

RAW FURS

OUR pricelists
don't show
the highest
prices, but our
checks sent in ex-
change for furs
have more than
satisfied hun-
dreds in the last
thirteen years.

Get up a sample shipment, send it in to
us, the check you'll receive will make
you another one of our dependable regu-
lars. If you are not satisfied, return the
check and your furs will be shipped back
to you. A square deal is yours for the
trying—all to gain and nothing to lose.
In the mean time FREE for the asking
—our price lists, shipping tags, instruc-
tions, and a list of our satisfied trapper
friends. Your name and address on a
postal card will do.

SOL WARENOFF & CO., Inc.
167 West 25th St. New York

LET US TAN YOUR HIDE.

Horse or Cow hide, Calf or other skins
with hair or fur on, and make them
into coats (for men and women), robes,
rugs or gloves when so ordered; or we
can make your hides into Oak Tanned
Harness or Slaughter Sole or Belt Leather;
or your calfskins into Shoe Leather.
Colors, Gun Metal, Mahogany, Russet or
lighter shades. Calfskins tanned in the
lighter shades of shoe leather, also
make elegant stand and table covers;
great for birthday, wedding and holi-
day gifts.

LET US FIX YOUR WORN FURS

freshen, repair and reshape them if
needed. Furs are very light weight,
therefore it would cost but little to send them in to us
by Parcel Post and get our estimate of cost; then we
will hold them aside awaiting your decision. If you say
"go ahead," very well; we will do so and hold them
free of storage until you want them. If you say "no,"
we will return them post-paid.
Our illustrated catalog and style book combined gives
a lot of useful information. It tells how to take off
and care for hides, calf and fur skins. About dressing
fine fur skins and making them into neckpieces, muffs
and garments. About taxidermy and Head Mounting.

The Crosby Frisian Fur Company.
571 Lyell Ave., Rochester, N. Y.

A. A. Readers Wrote This Page

Farm Business, The Church Situation and Fire Hazards Come Under Discussion

I WAS very much interested in your leading article on the editorial page of one of your recent issues. I think we apple men of New York State, without exception, are taking great interest in trying to put this over our Eastern apples, as you say in your article. One of the fruit trade papers is trying to throw cold water on the auction place. The "Producer News" of March 17, on the front page, has one of the nastiest articles it has ever been my misfortune to read.

Of course, the Western boxmen do a great deal of advertising when we do now. This practically accounts for their writing as they did. They try to stir up trouble between Eastern and Western interests, saying we were going to try and shut out Western apples from the New York markets, a thing that is so utterly ridiculous that it hardly seems worth denying.

It was my good fortune to spend some time this summer going through the orchards of Hood River, Wakima, and Wanataker, and after showing me through their orchards they would invariably ask me, "What do you think of it?" My answer would be, "You have a wonderful proposition now if you were only located where I am, within five hours of New York by motor truck. Your conditions would be ideal then." I think the people of New York are making up more to the difference in flavor of the apples of the two sections this winter than ever before; take, for instance, the McIntosh. The trader is taking them out of boxes and putting them in barrels. Box McIntosh are practically not wanted.—A. ROHNS, Washingtonville, New York.

REMEDY IS A GOOD PASTOR

Everyone seems to agree that the country church is not measuring up to its responsibility, but everyone seems also to inquire "What is the remedy?" From my observation, I have come to the conclusion that part of the remedy lays with the clergy itself. While not depreciating the ministry as a very high calling—there is none higher—yet young men enter the ministry without a thorough and careful preparation for it. Young men get a vision of being called to the ministry, and on the enthusiasm launch into it unprepared. Our commercial life is becoming more and more specialized, and young men to-day must be experts in the varied lines of business to succeed. I fear many preachers are working under the delusion of being called to preach Christ, when perhaps they were called to plow corn. The ministry to-day must be as much specialized as business, and unless they are the country church suffers.

Are Country Churches Training Schools for the Ministry?

The country church seems to be the training school for entrants to the ministry. Oftentimes, without preparation, a young man begins preaching, hoping at the same time to prepare himself by reading a course of study, and after a time, if he makes good, to be promoted to a more responsible ministry. Under conditions in the country church as they are, it is perhaps a good place to begin—at the bottom, it would be said in business. Assuming that the young minister makes good, the city church is his goal, and I firmly believe that the city church draws its best ministers from the ones who began in the country church. Ministers, like men in business life, have a worthy ambition of reaching the top, but country church work should be attractive enough to keep them there.

Compensation is Insufficient

Again, the compensation to the country minister is not sufficient to keep him according to present-day standards of living. The plasterer, bricklayer, carpenter, etc., all receive remuneration above that of the minister, and the margin of difference between their respective compensation is too wide. All are builders—the tradesmen of the material and the minister of things spiritual—but there should be an equaliza-

tion. The country church can afford higher salaries to its minister, and because the trades and business life have higher salaries, the ministry is not attracting the best young men.

I still believe in the church as the redemptive factor of our social and industrial life, especially in the country, and I believe also that country people are still responsive to appeals that reach them, but they must be sought after, compelled to come in, but after coming into the church, given applied principles of Christianity—not theory. To sum the whole situation up, the crux of the matter lays in a wide-awake, efficient, enthusiastic and prepared ministry.—I. L. MILLER, Bellsville, Md.

PUT THE FARM TOOLS UNDER COVER

W. H. HARRISON

I hope you good people are not like some of my friends, allowing your machinery to serve as shelter for your hogs, or as roosts for your chickens. A friend called at a neighbor's place the other day and this was just what was happening. All farming implements are now quite expensive, due to scarcity of steel. They were expensive enough before the war, but more so now. Don't see why they have to do this when their customers allow their implements to rust and rot to pieces so they do not last nearly as long as they should.

Our so-called farmers ought to look after this matter. Machinery costs too much for us to be careless about taking proper care of it. Sun, rain, and wind will take off the paint and put on a nice coat of rust, and this always means the beginning of the end of that particular machine.

The other day my hired man was caught taking a couple of bolts out of one implement, which was not in use, to repair another. "Not on your life," said I, putting one implement out of commission to get another repaired or fixed is a wrong method, to my notion, because I've found that when this is done the parts are seldom replaced and the other machine goes to pieces. So take my advice, which is from experience, after you're through with a machine for the season or time, see that it is put under shelter, oil and grease the metal parts and arrange to give the woodwork a coat of paint when the days are such that work cannot be done outside. You will then be amply repaid for the little time and trouble required.

PRECAUTION WITH LANTERN

WARNER E. FARVER

The number of farm buildings, particularly barns, that are burned as the result of overturned lanterns, is a great deal larger than many seem to realize. And this will continue to be so until we learn to handle the lantern with care around the barns and other buildings. This means that the only safe place for the lantern about the buildings is either in the hand or suspended overhead. We may size up the very best lanterns and we will find that none are anything better than a fire trap unless handled with the utmost precaution.

Average lanterns are of light weight, yet their particular construction makes them considerably top-heavy and easily turned over. Cats, dogs, or other means, even live stock, may be responsible for the overturned lantern and the building in ashes. We have seen lanterns set where if upset there would have been instant fire with no chance of extinguishing it. The least disturbance around a lantern thus placed will throw it out of balance and produce a fire in an instant.

In our barn we have found the only safe place to be overhead. We suspend the lantern from hooks on wires strung through the stables and feeding room. There are various ways of suspending them, but I prefer the wires with hooks fastened to them, and the hooks placed so that they can be slid from place to place. We have the wires strung overhead in the horse stable to the rear of

the horses, and this is fine when cleaning and harnessing the horses. We have another wire in the stable where the cows are in the stanchions, and as a cow is milked the lantern can be slid on to the next on the hook on the wire. In the feeding room we have another, and this makes it safe and convenient while feeding.

These overhead wires should be of about No. 10 or 11 wire, with hooks made of the same wire. A few fencing staples are all that is required to suspend the wires overhead. I once heard of a farmer who had a barn destroyed by fire as a result of an overturned lantern. He decided that the lanterns were made with flat bottoms for convenience in filling only, and had his lanterns all fitted with a cone-shaped muzzle fitted to the bottom, so that his hands could not set them down anywhere.

It is no excuse to set lanterns anywhere simply because we can. Use a little head work and save your buildings from ruin. As a rule, too, many of us forget that the handle of the lantern is made for hanging it up, as well as for carrying. It is a good plan to play safe. Better be safe than sorry.

WHY CLOVER FAILS

R. I. WEIGLEY

Can you raise clover? If you can't you can blame any one of the following reasons: Doves, game birds, sour soil, too late sowing, too early sowing, clover in spring in fall wheat on sod, no inoculation, cheap and foreign seed.

Here in East-central Pennsylvania we overcome most of these disadvantages by sowing our clover seed about "the hundredth day after New Year." By this time April has come, and the wheat in which we sow our clover seed has made enough progress to hide the seed from flocks of pigeons and field birds. If the seed is sown earlier, a warm spell in March may sprout it and a late freeze may kill all, like in '21 and '22. If seed is sown too late, there are chances that no pelting rain will cover and start it off during the present summer if dry weather follows.

We had poor success with clover until we limed our land. We have limestone quarries and lime kilns on the place and all about. So we applied lime in the old-fashioned way, which is at the rate of 200 or more bushels to the acre. Now our clover crop is enormous, and our corn averages round 200-ear bushels per acre yearly. We have several times sown a pasture field to wheat in fall and then sowed clover seed in same in spring, and every single time not so much as a single clover plant got started. Inoculation will not help much here because clover preferred to follow corn, then oats or wheat stubble.

Cheap seed is the cast-off trash, with lightweight seeds and weed contents. Foreign seed is unacclimated and of low vitality.

APPLY MANURE DIRECT TO THE LAND

It is always a problem how best to dispose of the stable manure during the winter season. There is some waste of plant food in any way that it can be handled and conditions should be considered when we undertake to solve the problem.

I use most of my stable manure on the land for corn, and if I can do it I draw the manure direct from the stable to the field and scatter it over the field. There may be some loss but most of this plant food is held in the soil. It is pretty well distributed through the soil and I have noticed that the early scattered manure seems to show up better on the crop than that distributed later in the winter. The manure may also be scattered over meadow land or the wheat field during the winter to advantage.—A. J. LEGG.

"We are enjoying the 'American Agriculturist' more than ever and see a great improvement in it for the past several months."—H. M. STANLEY, Onondaga Co., N. Y.

UNADILLA SILOS

THERE are good reasons why more Unadilla Silos are sold each year than any others.

They cure and keep silage better. They keep upright, airtight and repel frost. They are easiest and safest to use. Unadillas are known by their famous safety door front ladder.

This is the time to arrange for your Unadilla. Early orders now, while our factory is not rushed, earn the biggest saving we ever offered.

Write to-day for the big Unadilla catalog, early order discounts and agency offer for open territory.

PRINTED ENVELOPES, NOTEHEADS—300 either, \$1. **HONESTY FARM PRESS**, Putney, Vermont.

EVERYTHING PRINTED!—Samples free. **FRANKLIN PRESS**, B-28, Milford, N. H.

The Broad Highway—By Jeffery Farnol

ONCE more I rose, and looking down into the lane, found it deserted. I also noticed that the casement next to mine had been opened wide, and it was from here that the weeping proceeded.

After some little hesitation, I knocked softly upon the wall, at which the weeping was checked abruptly, save for an occasional sob, whereupon I presently rapped again. At this, after a moment or so, I saw a very small, white hand appear at the neighboring window and next moment was looking into a lovely, flushed face framed in bright hair, with eyes woefully swelled by tears—but a glance showed me that she was young, and of a rare and gentle beauty.

Before I could speak, she laid her finger upon her lip with a warning gesture. "Help me—oh, help me!" she whispered hurriedly; "they have locked me in here, and—and—oh, what shall I do?"

"Locked you in?" I exclaimed.

"Oh, what shall I do?" she sobbed. "I tell you I am afraid of him—his hateful, wicked eyes!" Here a tremor seemed to shake her. "To-night, when I found the key gone from the door, and remembered his look as he bade me 'Good night,' I thought I should have died. I waited here, close beside the window—listening, listening. Once I thought I heard a step outside my door, and opened the casement to throw myself out; he shall not find me here when he comes."

"No," said I, "he shall not find you here when he comes."

"But the door is locked."

"There remains the window."

"The window!" she repeated, trembling.

"You would find it easy enough with my help."

"Quick, then!" she exclaimed.

"Wait," said I, and turned back into my room. Hereupon, having locked the door, I got into my boots, slipped on my coat and knapsack, and, last of all, threw my blackthorn staff out of the window (where I was sure of finding it) and climbed out after it.

The porch I have mentioned, upon which I now stood, sloped steeply down upon two sides, so that I had no little difficulty in maintaining my foothold; on the other hand, it was no great distance from the ground, and I thought that it would be easy enough of descent.

At this moment the lady reappeared at the lattice.

"What is it?" I whispered, struck by the terror in her face.

"Quick!" she cried, forgetting all prudence in her fear, "quick—they are coming—I hear some one upon the stair. Oh, you are too late!" and, sinking upon her knees, she covered her face with her hands. Without more ado I swung myself up over the sill into the room.

"QUICK! hide yourself!" I whispered, over my shoulder, and, stepping back from the door to give myself room, I clenched my fists. There was a faint creak as the key turned, the door was opened cautiously, and a man's dim figure loomed upon the threshold.

He had advanced two or three paces on tiptoe before he discovered my presence, for the room was in shadow, and I heard his breath catch, suddenly; then, without a word, he sprang at me. But as he came, I leapt aside, and my fist took him full and squarely beneath the ear. He pitched sideways, and, falling heavily, lay still.

As I leaned above him, however, he uttered a groaning oath, whereupon I dragged him out into the passage, and, whipping the key from the lock, transferred it to the inside and locked the door. Waiting for no more, I scrambled back through the casement, and reached up my hand to the lady.

"Come," said I, and (almost as quickly as it takes to set it down here) she was beside me upon the roof of the porch, clinging to my arm.

Our farther descent to the ground proved much more difficult than I had supposed, but, though I could feel her trembling, my companion obeyed my whispered instructions, so that we were soon standing in the lane before the house, safe and sound.

"What is it?" she whispered, seeing me searching about in the grass.

"My staff," said I, "a faithful friend; I would not lose it."

"But they will be here in a minute—we shall be seen."

"I cannot lose my staff," said I.

"Oh, hurry! hurry!" she cried, wringing her hands. And, having found my staff, we turned our backs upon the tavern and began to run up the lane. As we went, came the slam of a door behind us—a sudden clamor of voices, followed, a moment later, by the sharp report of a pistol, and, in that same fraction of time, I stumbled over some unseen obstacle, and my hat was whisked from my head.

"Are you hurt?" panted my companion.

"No," said I, "but it was a very excellent shot nevertheless!" For, as I picked up my hat, I saw a small round hole that pierced it through and through.

The lane wound away between high hedges, which rendered our going very dark; but we hurried forward notwithstanding, urged on by the noise of the chase. We had traversed some half mile thus, when my ears warned me that our pursuers were gaining upon us, and I was inwardly congratulating myself that I had stopped to find my staff, when I found that my companion was no longer at my side. As I paused, irresolute, her voice reached me from the shadow of the hedge.

"This way," she panted.

"Where?" said I.

"Here!" and, as she spoke, her hand slipped into mine, and so she led me through a small gate, into a broad, open meadow beyond. But to attempt crossing this would be little short of madness, for (as I pointed out) we could not go a yard without being seen.

"No, no," she returned, her breath still laboring, "wait—wait till they are past." And so, hand in hand, we stood there in the shadow, screened from the lane by the hedge, while the rush of our pursuers' feet drew nearer and nearer; until we could hear a voice that panted out curses upon the dark lane, ourselves, and everything concerned. Thus we remained until voices and footsteps had grown faint with distance, but, even then, I could feel that she was trembling still. Suddenly she drew her fingers from mine, and covered her face with her hands.

"Oh, that man!" she exclaimed, in a whisper, "I did not quite realize till now—what I have escaped. Oh, that beast!"

"Sir Harry Mortimer?" said I.

"You know him?" she cried.

"Heaven forbid!" I answered, "but I have seen him once before at 'The Chequers' inn at Tonbridge, and I never forget names or faces—especially such as his."

"How I hate him!" she whispered.

"An unpleasant animal, to be sure," said I. "But come, it were wiser to get as far from here as possible, they will doubtless be returning soon."

So we started off again, running in the shadow of the hedge. We had thus doubled back upon our pursuers, and, leaving the tavern upon our left, soon gained the kindly shadow of those woods through which I had passed in the early evening.

THE path we followed was very narrow, so that sometimes my companion's knee touched mine, or her long, silken hair brushed my brow or cheek, as I stooped to lift some trailing branch that barred her way, or open a path for her through the leaves.

At last, being come to a broad, grassy glade, the lady paused, and, standing in the full radiance of the dying moon, looked up at me with a smile on her red lips.

"They can never find us now!" she said.

"No, they can never find us now," I repeated.

"And—oh, sir! I can never, never thank you," she began.

"Indeed," said I, "indeed you over-estimate my service."

"You risked your life for me, sir,"

said she, her eyes glistening, "surely my thanks are due to you for that? And I do thank you—from my heart!" And with a swift, impulsive gesture, she stretched out her hands to me. For a brief moment I hesitated, then seized them; but, even as I stooped to kiss them, my hat fell off.

"Sir Maurice Vibart!" she panted, and I saw a hopeless terror in her face.

"Madam," said I, "I am not Sir Maurice Vibart. It seems my fate to be mistaken for him wherever I go. My name is Peter, plain and unvarnished, and I am very humbly your servant."

"Come," said I, extending my hand to the trembling girl, "let us get out of these dismal woods." For a space she hesitated, looking up at me beneath her lashes, then reached out, and laid her fingers in mine.

CHAPTER XX

"JOURNEYS END IN LOVERS' MEETINGS"

THE moon was fast sinking below the treetops to our left, what time we reached a road, that wound away up a hill. Faint and far a church clock slowly chimed the hour of three.

"What chimes are those?" I inquired.

"Cranbrook Church."

"Is it far to Cranbrook?"

"One mile this way, but two by the road yonder."

"You seem very well acquainted with these parts," said I.

"I have lived here all my life; those are the Cambourne Woods over there—"

"Cambourne Woods!" said I.

"Part of the Sefton estates," she continued; "Cambourne village lies to the right, beyond."

"The Lady Sophia Sefton of Cambourne!" said I thoughtfully.

"My dearest friend," nodded my companion.

"They say she is very handsome," said I.

"Then they speak truth, sir."

"She has been described to me," I went on, "as a Peach, a Goddess, and a Plum; which should you consider the most proper term?" My companion shot an arch glance at me, and I saw a dimple come and go.

"Goddess, to be sure," said she; "peaches have such rough skins, and plums are apt to be sticky."

"And goddesses," I added, "were all very well upon Olympus, but, in this matter-of-fact age, must be sadly out of place. Speaking for myself—"

"Have you ever seen this particular Goddess?" inquired my companion.

"Never."

"Then wait until you have, sir."

THE moon was down now, and in the East I almost fancied I could detect the first faint gleam of day. And after we had traversed some distance in silence, my companion suddenly spoke.

"You have never once asked who I am," she said, almost reproachfully, "nor how I came to be in such a place—with such a man."

"Why, as to that," I answered, "I make it a general rule to avoid awkward subjects when I can, and never to ask questions that it will be difficult to answer."

"I should find not the least difficulty in answering either," said she.

"Besides," I continued, "it is no affair of mine, after all."

"Oh!" said she, turning away from me; and then, very slowly: "No, I suppose not."

"And yet," I went on, after a lapse of silence, "I think I could have answered both questions the moment I saw you at your casement."

"Oh!" said she—this time in a tone of surprise.

"You are, to the best of my belief, the Lady Helen Dunstan." My companion stood still, and regarded me for a moment in wide-eyed astonishment.

"And how, sir, pray, did you learn all this?" she demanded.

"By the very simple method of adding two and two together," I answered; "moreover, no longer ago than yesterday I broke bread with a certain Mr. Beverley—"

I HEARD her breath come in a sudden gasp, and next moment she was peering up into my face while her hands beat upon my breast with soft, quick little taps.

"Beverley!" she whispered. "Beverley!—no, no—why, they told me—Sir Harry told me that Peregrine lay dying—at Tonbridge."

"Then Sir Harry Mortimer lied to you," said I, "for yesterday afternoon I sat in a ditch eating bread and cheese with a Mr. Peregrine Beverley."

"Oh!—are you sure—are you sure?"

"Quite sure. And, as we ate, he told me many things, and among them of a life of wasted opportunities—of foolish riot, and prodigal extravagance, and of its logical consequence—want."

"My poor Perry!" she murmured.

"He spoke also of his love for a very beautiful and good woman."

"My dear, dear Perry!" said she again. "And he is well?"

"He is," said I.

"Thank God!" she whispered. "Tell me," she went on, "is he so very, very poor—is he much altered? I have not seen him for a whole, long year."

"Why, a year is apt to change a man," I answered. "Adversity is a hard school, but, sometimes, a very good one."

"Were he changed, no matter how—were he a beggar upon the roads, I should love him—always!" said she, speaking in that soft, caressing voice which only the best of women possess.

"Yes, I had guessed as much," said I, and found myself sighing.

A YEAR is a long, long time, and we were to have been married this month, but my father quarrelled with him and forbade him the house, so poor Perry went back to London. Then we heard he was ruined, and I almost died with grief—you see, his very poverty only made me love him the more. Yesterday—that man—

"Sir Harry Mortimer?" said I.

"Yes (he was a friend of whom I had often heard Perry speak); and he told me that my Perry lay at Tonbridge, dying, and begging to see me before the end. He offered to escort me to him, assuring me that I could reach home again long before dusk. My father, who would never permit me to go, was absent, and so—I ran away. Sir Harry had a carriage waiting, but, almost as soon as the door was closed and we had started, I began to be afraid of him and—and—"

"Sir Harry, as I said before, is an unpleasant animal," I nodded.

"Thank Heaven," she pursued, "we had not gone very far before the chaise broke down! And—the rest you know."

The footpath we had been following now led over a stile into a narrow lane or byway. Very soon we came to a high stone wall wherein was set a small wicket. Through this she led me, and we entered a broad park where was an avenue of fine old trees, beyond which I saw the gables of a house, for the stars had long since paled to the dawn, and there was a glory in the East.

As we approached the house, I saw that one of the windows still shone with a bright light, and it was towards this window that my companion led me. Having climbed the terrace

(Continued on page 366)

WHAT HAS HAPPENED ON "THE BROAD HIGHWAY"

A CHANCE acquaintance with whom he shares a frugal meal tells Peter Vibart why so many people have seemed to recognize him—he startlingly resembles his wicked cousin, Sir Maurice. When Peter tells of a duel he has seen, the friend realizes that he is now Sir Peregrine Beverley and hurries off to his lady love from whom poverty has separated him. Peter, after escaping a mysterious attack on his life, gets lodging at an Inn and from a restless sleep, wakes to hear a furtive step outside and the desolate sound of a woman's sobbing.

What Is This Dress Worth?

Before you guess I want you to know that the dress sparkles with richest style—a duplicate in design of an expensive Parisian gown at a price you will hardly believe possible!

By Virginia Castleton
Visualize yourself in this beautiful frock of soft, shimmering Egyptian silk Paisley and Navy Blue Longwear Gabardine Serge! See yourself the envy of all in this lovely creation showing the deft touches of gifted French designers. Recreated under my personal direction, Mannish type collar, tiny vestee (button trimmed) and cuffs of Serge. Soft all around girdle with loose tie sash. The beautiful skirt has the newest touch— $\frac{3}{4}$ -inch knife pleats all around—a feature found on all of the new importations. Waist and skirt both cut full for perfect fitting to all types of figures—a clever feat of tailoring! Even older women may wear it!

And Now for a Pleasant Surprise!
What is my price? Might I ask you \$9 or \$12 or \$7? Is such elegant style not worth it? But, my dear, you shall not pay a single cent additional for the extras in style, because my price is only \$3.89! Yes, that is all. Would you ever dream it possible! But you will not fully believe or appreciate until you see it. Try it entirely at my risk—because my company guarantees you absolute satisfaction! But be quick! This amazing offer can't be open long. And I do so want every woman in America to have one.

SEND NO MONEY

Just write me giving your size. I will then send you this fine dress. Pay the mailman only \$3.89 and postage when it arrives. Try it on and then if you don't like it, I will return every cent of your money.

That Thanksgiving Dinner

Two Menus and Recipes For Every Dish to Be Served

By H. A. LYNAN

IN the "good old days" (when everyone I had a spell of indigestion after Thanksgiving dinner) there were usually three meats, five or six vegetables and at least three desserts on the menu. We have learned to use moderation in all things—and even yet can cut the usual Thanksgiving dinner in half without injury to hospitality.

Two suggested menus, with instructions for preparing every article of food, are given here. The sensible housewife will certainly not increase them—she may even simplify without any harm. Such appetizers as pickles, olives, etc. are left to her discretion to add.

The Turkey Menu

Grape Fruit
Turkey with Sausage Dressing
Cranberry Fancy
Sweet Potato Croquettes
Baked Squash
Celery Salad
Fruit Puffs
Pumpkin Pie
Coffee, Cheese and Crackers

Turkey With Sausage Dressing.—To three pounds of crackers rolled out a few at a time on a bread board until quite fine, add enough of spiced seasoning to give the proper flavoring, a piece of butter, salt, two unbeaten eggs, one teaspoonful of cream and one pound of best sausage meat with the skins removed before adding to the mixture. Then add sufficient cold water to have mixture adhere lightly. Fill the turkey and bake in a moderate hot oven, until well browned. Serve on a large platter, thicken the gravy with a little flour and serve hot.

Cranberry Fancy.—One pound of cranberries, three fourths as much sugar, sufficient cold water to cover them well. Boil until like jelly and serve very cold.

Baked Squash.—Boil or steam, mash and let get cold as much squash as you desire to use (about two cupfuls make a suitable dish); beat very light, add one tablespoonful of butter, two raw eggs, three tablespoonfuls of milk, pepper and salt to taste. Put in a buttered baking dish, sift dry crumbs over the top and bake in a quick oven.

Sweet Potato Croquettes.—Boil one-half a dozen small sweet potatoes until tender. Mash fine and while yet warm add one tablespoonful of butter and the same of thick cream and a little salt. Form into pear-shaped croquettes, dip into a beaten egg, then into bread crumbs. Fry a light brown in hot lard, deep enough to cover the croquettes.

Celery Salad.—Chop fine two cupfuls

of celery, add a few chopped walnut meats and arrange on some lettuce leaves, then completely cover with any favorite salad dressing.

Fruit Puffs.—Beat one-half cupful of sugar and one teaspoonful of butter to a cream. Beat in one egg, add one-half cupful of milk, one and one-third cupfuls of flour, two teaspoonfuls of baking

Just a simple, home-like living room, such as thousands of New England farm houses can boast, is this one where Calvin Coolidge took the oath of office as President of the United States. John Coolidge, his father, administered it and is here seen seated at the table with the family Bible used for the ceremony.

Miss J. MacMillan, who took the photograph especially for the American Agriculturist—found the president's father glad to pose at the now historic "center table" for a picture to be used in this magazine and he took pains to arrange everything as it was on the night when he administered the oath of office to his son.

powder, one cupful of chopped raisins, citron and candied cherries. Steam for three-quarters of an hour in cups one-half full.

Pumpkin Pie.—Two cupfuls of stewed pumpkin, one tablespoonful of butter or lard, a pinch of salt, one-half teaspoonful of cinnamon, two-thirds cupful of sugar, one pinch of ginger, two eggs, two cupfuls of milk and a few nut meats. Beat eggs well, add pumpkin, sugar, butter or lard, salt, spices, and milk. Bake with one crust until well set.

The Chicken Menu

Sliced Oranges and Grapefruit
Roast Chicken
Carrot Custard
Breaded Parsnips
Raisin Bread
Mince Pie
Fruit Cake
Coffee
Cheese and Crackers

Roast Chicken.—Prepare the chicken as for roasting and fill with the following dressing: Crumb one loaf of bread, add one minced onion, a little salt and pepper, two tablespoonfuls of melted butter, moisten well with a little water. Bake until chicken is tender, then thicken gravy with a little flour and serve very hot.

Mashed Potatoes.—Boil several potatoes, until very tender in slightly salted water, first paring them, then mash while hot and add a little melted butter and cream, beat until fluffy and heap high in a dish while serving.

Raisin Bread.—One cupful each of milk and lukewarm water mixed with two tablespoonfuls of melted butter, one-half teaspoonful of salt, two tablespoonfuls of sugar, six cupfuls of flour, one yeast cake dissolved in one-fourth cupful of water, one cupful of seeded raisins, make same as any bread dough. Add raisins, after half the flour is used. Mix well, then add balance of flour.

Carrot Custard.—Boil carrots until very tender, sift as you would squash. Take one cupful of carrots, one-half cupful of sugar, one well beaten egg, two cupfuls of milk, a pinch of salt and a piece of butter size of a walnut. Flavor with cinnamon, and grated nutmeg over the top. Turn into a buttered dish and set in a pan of water to bake. Will take about forty minutes to bake.

Breaded Parsnips.—Boil several parsnips in a little salted water until very tender; then take out of the water and slice long and thin, dip in beaten egg then in bread or cracker crumbs and fry in butter to a golden brown.

Mince Pie.—Two cupfuls of raw beef, one tablespoonful of melted butter, one cupful of suet, two dozen chopped apples, one cupful each of currants and raisins, one half cupful of chopped walnut meats, a little chopped citron, one pound sugar, little grated orange rind, one cupful of fruit juice, one cupful cider, boil all until very tender. Let cool and remain in cold place several days before using. Make into pies with only one crust and as a top crust use strips of the pastry. Cover with a meringue of the beaten whites of two eggs and a little sugar, slightly brown in the oven.

Fruit Cake.—One pound of butter, one pound of brown sugar, twelve eggs, one pound of flour, one-half teaspoonful of cloves, one pinch each of nutmeg and mace, two teaspoonfuls of cinnamon, two cupfuls of raisins, four cupfuls of currants, four cupfuls of chopped almonds, four tablespoonfuls of chopped citron, juice and rind of one lemon, and one-fourth cupful of fruit juice. Cream butter, add sugar, eggs well beaten and remaining ingredients. Pour into a well-greased baking dish and bake until well done. Ice with a white frosting and decorate with nut meats and candied fruit.

If a Thanksgiving Plum Pudding is preferred to pie or other desert, use the following old family recipe:

Two and three-quarters cupfuls of bread crumbs, one cupful of beef suet, yolks of four eggs, one and one-half cupfuls of brown sugar, grated rind of one lemon, one teaspoonful of vanilla, whites of four eggs, one cupful each of currants and raisins, one-third cupful of flour, a pinch of salt, one teaspoonful of cinnamon, a little grated nutmeg, pinch of cloves. Work suet until creamy, add bread crumbs, add beaten yolks of eggs, sugar, flavorings and spices, then floured fruit. Lastly, beaten egg whites. Turn into a buttered mold, garnish with thin strips of citron, cover and steam three and one-half hours. Serve with fruit juice.

To keep oilcloth from breaking at the corners over the table, paste squares of heavy muslin, or flour sacks, or pieces of adhesive cloth, on the wrong side of the cloth at the corner.

A POPULAR BLOUSE

THE demure effect of this blouse is one which is much liked "on the Avenue." The advantage of it is that it looks equally well under or without one of the popular slip-on-sweaters.

No. 1277 cuts in sizes 36, 38, 40 and 42 inches bust measure. Size 36 requires 2 yards of 36-inch material. Price 12c.

Thinking Ahead

DO you dread just a bit, as you look ahead, the task of "getting straightened up" after Christmas? Did much of the regular housework have to be sidetracked at last year's holiday time? Did you find that the scramble to finish certain belated gifts for friends prevented going with the children on Christmas eve to hear them in the Sunday School program? Did you secretly and half-guiltily breathe a sigh of relief when Christmas was over, though of course you had a virtuous feeling of having strenuously endeavored to make others happy?

If not, this article is not for you. If you did, you may be interested in some of the subjoined suggestions.

First of all, if Christmas is a time for making others happy, is it not just as much a time not to make others

A NEW DRESS FOR APPROACHING HOLIDAYS

EVEN the dress with the smart side pleats can be made in one piece if the proper pattern is used.

No. 1884 has a diagram which shows how the trick is worked. The result is a dress simple to make, but the last word in up-to-date style.

No. 1884 cuts in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 requires 3½ yards 40-inch material with 4 yards ribbon for sash and cuffs. **Price 12c.**

The embroidery pattern **No. 666** is 12c extra.

Send your order to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

unhappy? Is it not "robbing Peter to pay Paul" when the attempt to reach a large circle of friends with home-made gifts disarranges the affairs of the entire family?

If we might keep before us the thought that Christmas should be a time of good cheer, of good will, of happiness for all, but particularly for the children, it would go far to correct many abuses of the season.

Sometimes we housewives map out too big a program and then either get all tired out in the Christmas rush or else get "stuck" in the schedule; sometimes we fail because we have no program at all.

Physical Ills Instead of Renewed Power

Physicians say that the number of their calls is always increased at holiday time, due very largely to over-exertion and over-indulgence on the part of their patients. It need not be so if more of the energy spent in preparing Christmas goodies that harm the physical life were devoted to bringing to the mental and spiritual life of the family the good and beautiful things of Christmas found in story and song and drama.

In too many households the Christmas sun sets on a weary mother, a harried father and a group of unhappy children dissatisfied with the costly gifts they have received. It would not be so if more care were taken to teach lessons of giving rather than of receiving—to make Christmas a time of charity and good will rather than of covetousness and selfish desires.

The woman who calls her family into council early before Christmas and with them arranges a definite holiday program, providing for the gift-giving, for the educational, social, religious and charitable demands of the season, so arranged as to give each member his own share of responsibility and of freedom; who is wise enough to "cut her coat according to her cloth," undertaking no more than she is warranted in believing can be carried out without over-exertion—this woman may hope that in her household the true Christmas spirit will be

Reviewing the Latest Eastern Markets and Prices

THE APPLE SITUATION

HERSCHEL H. JONES

THE November 1 Federal crop estimate report just out shows very little difference in estimated production compared with October 1 report. There is an increase of a few hundred barrels for the entire country and a slight decrease in the estimates for New York and Washington.

Carlot shipments of barreled apples this season to November 10 totaled only 43,192 cars compared with 46,243 cars last year to date, but the boxed apple States shipped 34,403 carloads up to November 10 this year, compared with 20,875 to date last year.

The New York market continues rather dull. There was, however, a better feeling generally in the market. While prices realized were not much higher than previously, there was a more active interest. The demand for Baldwins for direct shipment in carload lots has stiffened up considerably, now that most of the Baldwins have gone into storage.

The following wholesale prices at New York represent sales by direct receivers at the Barclay Street Pier or at stores, on A Grade minimum 2 1/2 inch apples; BALDWINs, best, \$4.25 to 4.50; fancy, \$5; ordinary, \$2.50 to 3.50. GREENINGS, best, \$6 to 6.25; fancy, \$6.50; fair stock, \$5.50 to 5.75; ordinary, \$4.50 to 5. HOLLAND PIP-PIN, \$5 to 5.50. MCINTOSH, best, \$8 to 8.50; few, fancy, \$8.75 to \$9, fair, \$7 to 7.50. HUBBARDSON, \$3 to 3.50; fancy, \$3.75 to 4. BEN DAVIS, \$2.75 to 3.25. NORTHERN SPY, best, \$5.50 to 6; fancy, \$7; ordinary, \$4 to 4.50. PEWAUKEE, \$3 to 3.50. ROME BEAUTY, \$3.50 to 4; fancy, \$4.50 to 5. TWENTY OUNCE, \$4 to 5. STAYMEN, \$3 to 4. WAGNER, \$3 to 3.50.

POTATO RECEIPTS HEAVY

Unusually heavy receipts of potatoes, mostly from Maine and New York, last week found the buyers sitting on the side lines looking for bargains. The Bushwick yard has been tied up by an embargo and cars from Long Island

have been ten days arriving when usually they get in over night. There has been considerable congestion in most of the railroad yards with as many as 130 cars at Harlem and 90 at 33rd Street on certain days.

Maine Green Mountains in carlots have sold from \$2.70 to 2.90 per 150-pound sack; in bulk from \$1.65 to 1.75 cwt.

States have sold from \$2.40 per 150-pound sack to \$2.60; in bulk from \$1.50 to 1.65.

Long Islands sold from \$3 to 3.25 per 150-pound sack f.o.b. loading point; bulk from \$1 to 1.20 bushel loaded.

The New York City wholesale market continued dull with many dealers glad to sell at about cost.

The crop estimate for November on potatoes showed an increase of over 15,000,000 bushels over that of October 1. Of this increase about 11,000,000 bushels comes from the three States of Maine, New York and Pennsylvania. New York's estimate of 39,406,000 is in excess of 2,000,000 bushels over last year's total production. The total yield estimated for United States of 416,700,000 bushels is already beginning to approach last year's record breaking crop of 451,185,000 bushels.

Even with its tremendous yield last year the United States ranked fourth in importance in the world's potato yield. Germany the leading country produced over a billion bushels more than United States while France slightly exceeded this country.

CABBAGE CHEAP

Good medium Danish cabbage sold in New York for \$1.20 cwt. sacked. In bulk at \$12 to 13 ton f.o.b. loading point. Demand was very dull.

FANCY EGGS ADVANCE

Fancy eggs took another step upward last week and closely selected hennerly extras brought 84c to 86c per dozen. Dealers are talking of dollar eggs if more fresh eggs do not come in. All grades of eggs show an improvement, even lower grades, checks and dirties moving out at fair prices.

CHEESE MARKET FIRMER

No effect seems to be felt on the cheese markets by the November reports of larger holdings throughout the country. In fact the market has been firmer each day. On November 15, held State flats average run, brought from 25 1/2 to 26 1/2 cents.

BUTTER MARKET STRONG

About twenty cars of butter from Canada during the past few days was the principal factor preventing an acute shortage on the market in New York City. As it was, prices advanced slightly, reaching the highest point of the season. The Canadian butter with

duty paid brought 48 1/2 to 50 cents per pound. Shipments from Denmark increased and had some effect in stabilizing the market.

Withdrawals of butter have been heavy during the last few weeks. Total holdings are considerably less this season than for the five year average and generally operators feel the outlook is favorable.

POULTRY MARKET DULL

Express shipments of live poultry met a very dull market the greater part of the week although there was a slight improvement under lighter receipts later in the week. Ducks and geese met a fair demand at 25 cents per pound. There was likewise a fair demand for turkeys at prices ranging around 45 cents per pound.

MEAT SUPPLIES LIGHT

Supplies of live calves were light toward the end of the week and the market was steady with prices ranging from \$13 to 14.50. Lambs declined slightly under heavy receipts while country dressed veal met a fair market.

GOOD DEMAND FOR HAY

The hay market continued strong during the week under small receipts and reported light invoices from shippers. Number 2 hay brought as high as \$29 and No. 1 \$31 per ton.

NEW STRAWBERRY VARIETIES

ALVAH H. PULVER

The New York State Fruit Testing Cooperative Association, Inc., is introducing three new strawberries, the Beacon, the Bliss and the Boquet, developed on the grounds of the State Experiment Station at Geneva. The horticulturists of the station state that the new varieties give unusual promise for the garden or for commercial plantings. The three varieties cover almost the entire strawberry season in New York, Beacon being an early sort, Boquet an early mid-season variety, and Bliss a late mid-season variety. All three varieties have been thoroughly tried out on the station grounds and are recommended by the station authorities for trial by strawberry growers.

Beacon, said to be one of the best early strawberries, ripens with Dunlap, long a standard early kind. It is described as drought resistant, productive, and of excellent quality. In five out of the last six years, the fruits of Beacon were rated as the hand-somest of their season on the station grounds. Boquet, ripening about half way between Beacon and Bliss, is characterized by large, light red berries of sweet, rich flavor. The fruit ships and keeps well, and the variety is highly recommended as a mid-season,

main crop, market berry. The plants are said to be vigorous, productive, and healthy, but do not develop as many runners as is desirable for rapid propagation. Bliss, a late mid-season variety, produces large, handsome, bright red berries of excellent flavor and quality. The plants stand high among commercial varieties because of their ability to yield well under adverse weather conditions, say the fruit specialists. It is believed that all three of these new varieties are well worth a trial, at least on a small scale, both by the amateur gardener and commercial grower.

Selling Eggs Through Cooperation

(Continued from page 354)

mix two businesses. Either one or the other would suffer.

For some reason, not a whole lot has been done to sell eggs through cooperation. It does not seem that the cooperative marketing problems of the poultrymen would be any greater than those selling apples or milk. We predict that one of the next notable cooperative achievements will be organizations to sell poultry products.

What do you think about it? We will be glad to have your suggestions in a short letter as to what you think might be done.—The Editors.

What Is Wrong With the Cooperatives?

(Continued from page 359)

was not represented at all, neither in the market place nor in the legislative hall. Why is it that to-day agriculture is getting more favorable attention than ever before? Why is there a better understanding on the part of city folks toward farm affairs? Why has there been more constructive legislation in the last five years than ever before—and why are farmers slowly getting better prices for their products? It is because the farmers are organized, and because the great majority of their leaders are honestly striving to serve the farm and the farmer.

The Broad Highway

(Continued from page 363)

steps, I noticed that this was one of those French windows opening to the ground. Now, looking through into the room beyond, I beheld an old man who sat bowed down at a table, with his white head pillowed upon his arms, so very still that he might have been asleep but for the fierce grip of his twitching hands. Upon the table, at no great distance from him, lay a hat—a very ill-used, battered-looking object—which I thought I recognized; wherefore, looking about, I presently espied its owner leaning against the mantel. He was powdered with dust from head to foot, and his worn garments looked more ragged than ever; and, as he stood there, in the droop of his head and the listless set of his shoulders, there was an air of the most utter dejection and hopelessness. But, as I looked, the window was burst suddenly open: "Perry!"

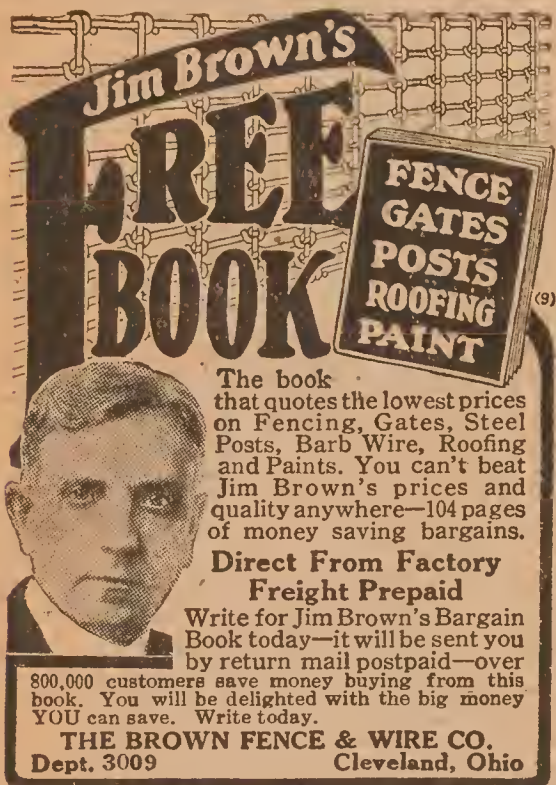

Love, surprise, joy, pity—all were summed up in that one short word—yet deeper than all was love. And, at that cry, the white head was raised, raised in time to see a vision of loveliness caught up in two ragged arms. "Father!"

And now the three heads—the white, the golden, and the black—were drawn down together, drawn, and held close in an embrace that was indeed reunion.

Then, seeing my presence was become wholly unnecessary, I turned away, and was soon once more deep among the trees. Yet, as I went, I suddenly heard voices that called upon my name, but I kept on, and, in due season, came out upon the broad highway.

And, in a little, as I went, very full of thought, the sun rose up. So I walked along through a world all glorious with morning.

Answers to Questions Received From A. A. Readers

Is it practical to use sweet clover in the form of silage? What is the rate of seeding per acre for sweet clover and at what stage of maturity is it cut?—J. D. B. Broome Co., N. Y.

I HAVE not heard of it being done. If practical, I would not consider the plan profitable. In Central Pennsylvania it is easy to have green Sweet Clover for cows April 15 to November 15, about two weeks' less time in Central New York. On November 1 we cut sweet clover hay. It freezes dry and now in March the horses are leaving oats and corn lay untouched until they have eaten a part of the sweet clover hay. The cows did the same thing when I had a dairy. The hay is green in color and not browned by sun. I doubt if silage could equal this hay. Moreover, cows, like men, crave variety. Grow the corn for silage on a sweet clover sod without manure or fertilizer and use both corn silage and sweet clover hay.

How much seed do you sow per acre? A pound of hulled sweet clover contains 290,000 seeds; eight pounds per acre will give 52 seeds per square foot. We usually get a stand of 15 to 30 plants per square foot, using eight pounds of scarified seed with a wheelbarrow sower. In the following spring the plants stood, each plant will send up 10 to 30 stalks, and a growth results that smotheres every other living thing.

But you can't sow clover seed uniformly by hand, so don't try it. If you have a sower of the "fiddler" kind, or the shoulder-wheel type, throw them away and buy a wheelbarrow sower. I have found a 95 per cent accuracy in the wheelbarrow sowers. Sweet clover in oats in fertile soil may be used as hay. I allow the oats to fully mature, and then mow it and cure as hay. This makes a wonderful feed. In this land the oats can be harvested in the usual manner. In the wheat stubbles I cut a very heavy crop of sweet clover hay November 1. In the spring the stalks are very coarse. I have tried to make hay in May and June and never succeeded. It will not cure.—G. E. S.

PROPOGATING LOGANBERRIES

In your August 4th issue, you have some recipes for Loganberries. Last spring I bought two plants and they are growing splendidly. I have never seen any grow before, and none of our neighbors know anything about them. I would like to know how they propagate and is it natural for them to trail on the ground like the dewberry?—Mrs. W. F. B., New York.

In setting a new plantation, tip plants are desirable, although plants are sometimes secured by "layering" or by root cuttings. The tip plants are sometimes grown for one season in the nursery before they are set in the field.

Tip plants are obtained from plantations by burying tips of the young canes during the late summer or autumn. The canes trail along the surface of the ground. If the soil is mellow and a good supply of moisture is provided they will take root at the ends. Better plants, however, usually will be secured if the tips are buried in a few inches of soil. By the following spring, plants suitable for setting in the field will have formed.

If a larger number of plants are desired, the ends of the young canes may be pinched off when they are 4 to 6 feet long. Side branches or laterals will then grow from the nodes along the canes and will root in the autumn. If conditions are favorable, these laterals will make as strong plants as if only one new plant were produced by each cane, and such plants will be fully as productive as those formed by a cane which has not branched.

Forced Laterals Do Not Bear Well First Year

A cane which has been forced to send out laterals and to make many tip plants will not bear as well the following year as a cane which has been allowed to grow to its full length and to form only a single plant at the tip. The plant itself, however, will not be injured by this practice. Growers of the Logan blackberry can add materially to their incomes by supplying tip plants to nurserymen and to those who plan to set new plantations, and, in practice, most of the nursery trade is supplied by those who grow this

variety for its fruit, but who get an additional income from the sale of tip plants.

Another method of propagating the Logan blackberry or Loganberry is to make cuttings of the roots about 3 or 4 inches long and bury them in the winter in trenches at a depth of 3 or 4 inches. Some of these pieces of root will develop into fair-sized plants by the end of a year. Roots will also be formed at the nodes if the canes are covered with soil in the autumn. The formation of roots will be hastened, however, if slits are made on the underside of the nodes. This method of propagation is not often satisfactory and is rarely used.

Seeds of the Logan blackberry will germinate readily, and plants can be grown from them. They will not be exactly like the Logan plant, however, and nearly all will bear fruit inferior to it.

WHITE GRUBS DESTROY STRAWBERRY PATCH

I set out a strawberry patch this spring of about an acre and a half and the entire piece was completely destroyed by white grubs working in the roots. I will be very thankful if you will give me a remedy for destroying them. Unless I can get something to destroy them it will be impossible to raise strawberries successfully in this section?—R. E. T., New York.

The white grub to which you refer, is the larva of the "May beetle" or "June bug," familiar to country folks as "night fliers" and particularly annoying around lights.

The adult beetle lays its eggs in the soil and about two years are required for the development of the larva or "white grub." At the end of the second summer the larva makes a pupal cell about nine or ten inches down in the soil and transforms to a beetle which is at first soft-bodied. The following spring it emerges as a hard beetle.

Grassland is the natural breeding place and infestation usually is experienced in fields that have been in sod for a number of years and have recently been broken up for other crops. Undoubtedly this is the situation in your case.

There is no chemical that can be applied to the soil to kill white grubs. Careful planning of crop rotation is the best means of avoiding injury. Fall plowing will help to some extent. Chickens following the plow will destroy the grubs that are exposed. Hogs are fond of white grubs and will root up and eat large numbers of them. In your case it may pay you to fall plow the patch, putting in a cultivated crop next year following that with strawberries. It is also often the case that heavy applications of manure will infect a field with white grubs.

ENGINE CYLINDER SCORED

We have a six horsepower gas engine which leaks compressions very badly. I put in new piston rings, but it didn't help any, so I ordered another set of rings 25-1,000 over size which I expect to fit in. The cylinder of our engine is slightly scored. Do you think by using valve grinder on the new rings when put in and working the piston and rings forward and backward will wear off the scored part of the cylinder or do you think it best to simply fit the new rings on the piston? Would they have a tendency to wear the scored part of the cylinder off? Also please let me know if the thickness of a ten-cent piece would be too much play to allow for the rings when fitted on the piston?—G. B., New York.

Once a cylinder has been badly scored it is rather difficult to bring back good compression except by repairing the cylinder by having it rebored and putting in oversize pistons. A temporary repair for scoring which sometimes gives good results is to apply Smooth-on to the scores, using a piece of broken piston ring as a guide for scoring it down smoothly to bring it to the same curvature as that of the cylinder. New piston rings are not very likely to improve conditions even if they are slightly oversize they will wear more rapidly than will the cylinder probably, and it is unreasonable to expect that they will cut the cylinder down so that the scoring is eliminated. In fitting piston rings the thickness of a ten-cent piece between the ends of the ring is just about proper clearance.

BEAUTIFUL NEW SLENDERIZING

Regular and Stout Sizes 32 to 54 Bust

SILK and WOOL EMBROIDERED SERGE DRESS \$3.98

Think of it! Only \$3.98 for this rich looking, smartly tailored Serge Dress! During this sale only, no extra charge for larger sizes. Picture gives only faint idea of the exquisite beauty of this ultra stylish creation. Bring a shawl and grace to the heavier figure. Only limited sale—one to a customer. Be quick, before this astounding offer is withdrawn.

Send No Money

Fashioned from fine quality Longwear Serge, along lines favored as the vogue in fashion centers. Richly embroidered in contrasting color in Silk chain-stitch embroidery with distinctive medallions in wool French Knots. The V shape roll collar is all the rage. New wide flare sleeves embroidered at cuffs. Self material sash to be tied at back—front or side as desired. Splendidly made in every detail. In latest style, you will be justly proud to wear this wonderful dress. Just send your name, size and color, no money now. On arrival pay postman \$3.98 and postage. After try-on if you are not more than pleased, every cent of your money will be quickly returned. COLORS: Navy Blue or Brown. SIZES: 32 to 54 bust. STATE SIZE AND COLOR.

No Extra Charge for Big Sizes Now

NEW LAMP BURNS 94% AIR

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

Even as a Grain of Mustard Seed—

Long ago it was written that faith, even tho small as a grain of mustard seed, could remove mountains.

Henry Ford, with unbounded confidence, has labored for more than twenty years to remove the mountain of difficulty standing in the way of modern transportation. He has sought always to give the world practical transportation at low cost.

Many have wondered why Ford products, whose remarkable value time and use have proved, can be produced, sold and serviced for so little.

It is because from forest and mine to finished product there exists a marvelous coordination of every phase of manufacture. From scores of widely scattered Ford-owned sources the raw materials are brought by Ford transportation units to Ford plants, moulded, machined and assembled into cars, trucks and tractors.

At no time is the high quality of manufacture or workmanship beyond the supervision of the builders. Unhindered by changing market conditions, Ford products are built uniformly sturdy and dependable year after year.

This unusual development of industrial economy delivers your Ford car, truck or tractor at the lowest possible cost.

More "Buy Back" Experiences

A. A. Service Bureau Tells How Standard Food & Fur Does Business

THE rabbit industry is sweeping America," says one of the form letters with which the Standard Food & Fur Association sought to make new customers. Since this and similar letters contain such statements as "for young from does which we furnish at \$15 each, we pay not less than \$15 a pair," or "We absolutely guarantee to buy back hares, raised from the parents we sell you, at not less than \$7 to \$18.50 per pair," it is not surprising that the sales of the firm did increase in a spectacular manner.

But the promised sales to be made by the purchasers of rabbits did not, apparently, go forward as smoothly as the circulars and letters would lead a prospective customer to believe. Indeed, judging by reports we have had from American Agriculturist readers, many of these anticipated sales, so glowingly pictured, never took place at all.

In the first place, having once sent a check or money order in payment, a purchaser did not always find it easy to get his original order filled. Five months elapsed in a case we described in the article in the November 17 issue; at other times, it has been from five weeks to three months before rabbits arrived, or even, in some cases, before an acknowledgment had been received.

In some cases, the buyers tried to cancel; we told last month how such an order came through six months after it had first been sent in and after repeated instructions to cancel.

However, other purchasers received the animals and started in to work for the "real money" promised in the alluring circulars and form letters. One New York State boy whose father subscribes to the American Agriculturist, invested his hard-earned savings in a pair of Black Siberians. He says that upon examining the buck when it arrived, he discovered scars which showed that abscesses had been lanced; that the animal had fresh abscesses and in spite of the utmost care continued to develop more and finally died. This after the company had held him up for some time waiting for his order.

However, the doe was bred and young Mr. V. soon had rabbits to turn in for the "real money" promised. He wrote three times for shipping instructions; the third letter was answered by the secretary who said that they had received only one request. At his suggestion, full information as to sex, weight and age was sent and he soon advised the boy to send a male and female, to weigh over 6 pounds each. "We ask that you pay expressage and we will reimburse you upon presentation of express receipt" read the letter. Accordingly, Mr. V. shipped 7¼ pound buck and a doe of 7 pounds and with his letter, his express receipt.

Twenty-five days later, a letter came from the firm saying the rabbits were both under six pounds. They offered to purchase the hares, but not to pay the expressage and they asked that the old contract be returned for renewal. "Upon receipt we will forward you a new contract properly renewed, together with check, covering hares," says the letter.

Then followed considerable correspondence. Mr. V. stuck to his point that the

hares were not underweight. He also did not want to give up his contract until his first shipment was paid for. The firm wrote in one letter: "You are not assuming the right attitude at all."

One letter, after a lapse of two months, finally said: "We have instructed our treasurer to remit to you \$11." Mr. V. waited two more months. Then he wrote the firm. They said the check had been sent. Three weeks later, the aid of the American Agriculturist Service Bureau was enlisted. It was just a month later when we forwarded a check for \$11 to Mr. V. and as his first letter from the firm had been dated in January, and his check was received the following November, it appears that he worked eleven months to make eleven dollars—not as large a "spare time" income as one could imagine!

The Standard Food & Fur Association

me a lot to raise, and I am a mother with children and am not able to lose it. I have a lot of hares and they will not buy them as they guaranteed me they would. What shall I do?"

That last question is a hard one to answer. The Standard Food & Fur Association, as far as our records go, has never attempted to do so.

It also does not seem as though the files were kept in a businesslike way, to say the least, when there is no trace of correspondence with a customer whose dealings extend back over a year's time! Inasmuch as our letter of last January never elicited the favor of a reply we have no way of knowing whether or not the missing correspondence—to say nothing of duplicate letters, receipts and other documents forwarded by Mrs. B.—ever came to light.

According to the statement of the Standard

Food & Fur Association, the Argent de Champagne rabbit, a French importation, is a very valuable breed. These are, therefore, among the most costly animals. A subscriber who thought it would pay to get the best, purchased a doe, which was to have been bred before shipment. Mr. W. waited for the expected litter, but the young rabbits never arrived.

He, therefore, wrote the company to know what they would offer for the doe. They said they were under no obligation to repurchase stock, but offered \$10, expenses of shipment to be carried by Mr. W. In order to save what he could of his money, Mr. W. accepted the offer and sent the doe back C. O. D. \$10, express prepaid.

He writes:—"The following day, I received a letter excitedly emphasizing the fact that they never authorized me to ship them a rabbit with a \$10 C. O. D. charge on it, and

asking me to release the C. O. D. and they would accept the rabbit. So I accordingly wired the New York office at once to release the doe. After waiting two weeks without reply, I finally wrote the express company and received a letter back that C. O. D. was released and the company had taken the rabbit."

Then followed the usual complaint and silence on the part of the company. The \$10 did not arrive. The Service Bureau took it up, writing the firm letters at regular intervals for some months. Whether or not, they settled with Mr. W. we do not know, for they never gave us the courtesy of a reply. We are inclined to think that Mr. W. probably summed up the case when he said: "I am now out \$25 plus express charges back, and have neither money nor rabbit."

Even when we succeeded in getting remittances for our subscribers, practically every case was long drawn out and became unnecessarily involved by contradictory statements on the part of the company. One debate over \$9.50 extended from November 16, 1922 to January 8, 1923. Another case began in March, was referred to them for settlement without success, came to us early in October, and in November we had the pleasure of sending Mr. C. his check.

One of the most complicated cases, brought to our attention last May, has apparently been abandoned by the Standard Food & Fur

(Continued on page 378)

HUNDREDS OF YEARS BEHIND THE TIMES

These Russian peasants are "plowing" for grain. When farm machinery is used on the hundreds of thousands of acres in the world where hand methods now prevail, what will be the effect in the world's food supply and prices?

states that many letters from satisfied customers are available, so it would seem that in spite of the cases in which stock is unaccountably delayed or in which it is delivered, but progeny is not bought back, there must be some cases of purchasers who sell rabbits to the firm and carry on business over some space of time.

One such instance is included in the American Agriculturist files.

Mrs. B. of Maryland sent us, just a year and a month ago, a claim for \$8.45 for a pair of Belgium Hares, plus freight. She wrote: "I have been shipping stock to them for more than a year and have trouble in getting my money back every time. They have said they would send it (\$8.45) but it has been two months and they will not answer my letters any more."

We immediately wrote to the firm, and received in reply a letter stating that they had no correspondence at all with the customer. We asked Mrs. B. for her express receipts and previous letters from the company, but she informed us that she had long since sent all such documents to the company at their request. They sent a letter saying: "Find enclosed check for hares for \$7 and express \$1.45" and there was no check there," said Mrs. B.

Again we wrote the firm, but to no avail. Our last letter, going over the facts and asking for the check has never been answered. Mrs. B. had written us: "Those hares cost

Opening The Door To Many Markets

How The "Federated" Operates—A Radio Talk Broadcast From WEA

I HAVE before me a map of the United States. My attention is focused upon New York State with its annual production of \$30,000,000 worth of apples, its \$3,750,000 worth of pears, its \$2,000,000 worth of peaches, and its other fruits and vegetables valued in additional millions. The great wealth of the Empire State in its fruits and vegetables is an asset that vitally affects every consumer as well as every producer. The fruit must be marketed with as little waste in the marketing methods as modern brains and modern organization can devise. That efficiency means the public welfare—better returns to the growers for their labor and investment, and more equitable prices to the consumers in our large cities. The producers of this immense tonnage of perishable products have a relatively short marketing period. In the case of apples it extends roughly from early August, until the following May, at which time the last of the fine winter apples are sold on the apple markets of the world.

Several thousand of the leading fruit growers in the western part of New York State have been perfecting their marketing methods for the last few years, until now their organization—the Western New York Fruit Growers' Cooperative Packing Association—has an annual output of 3,000 to 3,600 carloads for sale through national cooperative channels.

Following down on the map into New Jersey, we find a similar situation prevails among the leading peach growers in the Garden State.

Here the growers have organized into the Jersey Fruit Growers' Cooperative Association. This year they marketed approximately 10 per cent of the commercial peach crop of New Jersey, and during the short period of from late July until late September. There is also in New Jersey the Garden State Potato Growers' Cooperative Association, confronted with a short marketing season and the need of wide distribution.

Turning north into the New England States our attention centers upon the great Aroostook County of Maine, noted far and wide for its production of famous Maine spuds.

The cooperating growers in Maine—approximately 3,100—have united into the Maine Potato Growers' Exchange. Their tubers are sold over a marketing period of from early September, until Maine potatoes go off of the market in the spring.

Transferring our attention now to the northern part of the Middle States, we see the location of the fruit and vegetable centers in Ohio, Indiana, Michigan, Illinois, and

By W. H. BULLOCK

Director, Department of Information, Federated Fruit and Vegetable Growers

then to the left on the map the well-known potato regions of Minnesota, Wisconsin and the Dakotas. Many of the associations in these States, such as the Michigan Fruit Growers, which is made up of 26 local associations, have been developed on a regional basis within the current season. The Indiana Farm Bureau Onion Growers' Exchange, now selling two-thirds of the com-

rado, we find the fruit and vegetable interest now organizing, and the citrus fruit growers of California already well developed.

Our interest in Texas and through the Southern States centers for the moment upon the recently organized onion, tomato and other vegetable interests. Here again the producers are confronted with a relatively short marketing period. In Louisiana, Arkansas, Kentucky, Tennessee and Alabama we see the geographical center of the most recent move to develop large organizations of strawberry growers, whose crop is marketed in six to eight weeks during the spring of the year.

In Louisiana and Mississippi the story repeats itself, and in Alabama with its newly-popular Satsuma oranges, and in Florida with its great vegetable interests, we find the growers cooperatively organized and looking to the markets of America for the sale of their crops.

Coming north, we pass through the great watermelon belts of northern Florida and southern Georgia, where the growers have now organized to a point which controls the marketing of nearly 50 per cent of the commercial watermelon acreage in that territory. Bearing in mind the organized apple growers of West Virginia, we have briefly covered the high spots of recent cooperative development among fruit and vegetable growers in our circle of the United States.

From the Atlantic to the Pacific Coast and from the Gulf to Canada, a great variety of fruit and vegetable products are being sold coop-

eratively. The individual growers are organized into their local associations, which in turn have affiliated into State or regional organizations for the common good.

Despite the variety of the products, several outstanding factors are apparent. The fruits and vegetables which we have mentioned, all have a shipping season which extends from a few weeks to a number of months, but in no case does it occupy the full twelve months' period. While the shipping season is at its height, the products of our friends in New York, in New Jersey, in Maine or elsewhere around the country, must be distributed and sold upon a wide range of carlot markets. The marketing congestion which causes a glut by the dumping of products upon a narrow range of markets must be met by the cooperating growers. Each State or regional Exchange needs a full sales service upon the carlot markets of the country for a relatively short period of time. It needs as intensive a representation

(Continued on page 378)

Secretary Wallace studying the products of the East at the recent Fruit Show. Left to right—C. S. Brigham, Commissioner of Agriculture, Vermont; Henry C. Wallace, Secretary of Agriculture; T. E. Cross, Chairman of the Exhibit Committee of the Apple Exposition; Berne A. Pyke, Commissioner of the Department of Farms and Markets, New York. Successful Fruit Shows like this one, together with cooperative activities like those described by Mr. Bullock in his radio talk on this page, are doing much to help farmers' marketing problems

mercial onion production in the State, is another typical example.

Shifting out interest now to the great northwestern apple regions of Washington and Oregon, we find the same problems. The apple growers have followed the four "eyes" of cooperation: Organize, Standardize, Merchandise and Advertise. They have made northwestern apples famous upon the markets of the country. The development of cooperative organization in the northwestern territory is perhaps more pronounced than in the East, and a larger per cent of the growers are united into great regional cooperative exchanges. Idaho is now coming in for its share of attention. The problem of a short marketing period and the need for intensive, wide distribution and sale of their products is similar to that we have just discussed, with the exception that the markets are not next door, as in the case of our eastern friends, but are several thousand miles from the orchard packing houses.

Following down through Utah and Colo-

A Pilgrim Thanksgiving

Written for Thanksgiving Number of American
Agriculturist Thirty Years Ago

"THE Pilgrim fathers first fell upon their knees, and then upon the aborigines." If anybody can tell the story of the fathers with fewer words and more wit than is packed into this famous sentence, let him. The Pilgrim fathers were hard-working farmers, good fighters, and above all, God-fearing men. This, when you stop to think of it, is a grand combination of virtues. It is a combination found to-day in every State in the Union, and if this were not so, we might cry from the bottom of our hearts: "God save the country!" For there are farmers, as there are hirelings, and lawyers, capitalists, politicians, and members of every craft, who are neither hard-working, courageous, nor God-fearing. It is scarcely probable that these words will find their way to such, but whether they do or not, there is a lesson for all in the lives of the Pilgrims, and particularly for us now, in the day of Thanksgiving which they instituted.

Suppose, for instance, that the passengers of the Mayflower had come to the coast of North America from mere motives of business. They tossed for many weeks on the stormy Atlantic, and when at length they set foot on land they found the aborigines anything but glad to see them. Then, too, it was a raw, cold climate; crops would not grow till the forests were felled, and did not want to grow even then. It was a struggle for existence, precluding the mere thought of accumulating property. Had the pilgrimage, then, been made from motives of gain, think you the little colony would have greeted a harvest adequate to save them from starvation as an occasion for Thanksgiving and prayer? The Mayflower would have scudded for England under every inch of sail, and the disgusted voyagers would have reported that there "wasn't even a living in it, not to speak of money." But the Pilgrims stood for the majesty of an idea—"civil and religious liberty." No gold was in sight, nor diamonds, but this priceless jewel they won. As a result, the spirit of

the Pilgrim fathers is alive, very much alive, from Plymouth to the Golden Gate, to-day.

The farmer, or any other man, whose primary motive is gain, is bound to be discontented, whether he acquires a bare subsistence or a hundred millions. To keep constantly before the vision a certain sum of money or piece of property to be acquired, is to miss a thousand happy scenes along the road. There is a heartfelt Thanksgiving every year for all who, in the struggle for spiritual triumph, find themselves fed and clothed and out of debt. "Seek ye first the kingdom of God and his righteousness, and all these things shall be added unto you."

Who Has a Better Plan?

SOME of those who wish to defeat the Rural Education Bill, which will probably be before the New York State Legislature this winter are saying among other things that it is so complicated it is impossible to understand it. This bill is not more complicated than any other general bill, which is up for consideration. We have often wondered why legislators go on year after year using legal terms that are so difficult for laymen to understand. We have spent hours trying to figure out the meaning of some complicated legal sentence that could have been much better expressed in a few short Anglo-Saxon words.

But the Education Bill is no worse in this respect than other bills. As a matter of fact, there are only a few fundamentals in this bill that are new and different from the present education law.

In order to incorporate these new fundamentals it was necessary to re-write the whole law. In the old law, for instance, all the details such as publishing the notices of school meetings, when, how and where the meetings should be held, what officers are to be elected, etc., are duly set forth. All such details must be incorporated in the law when it is re-written, but they are not new material.

There are three fundamental features of the new bill that are different than the present law. These are first, the plan of administering the schools; second, the plan of supervising schools; and third; the plan of financing schools.

Under the plan of administration, the bill provides for the community district made up of a certain number of rural school districts and administered by a board of education, consisting of at least one member from each district in the community district. Boundaries of each rural-school district would be kept as they are now and no school could be consolidated or closed unless the people in that district voted to do it themselves.

The plan of supervision keeps the number of supervisory districts as they are now, and each supervisory district would consist of a number of community districts. The district superintendent would be the chief supervisory officer in the supervisory district and he would be elected or appointed by a board of education consisting of one member from each of the community districts in the supervisory districts. This board replaces the present board of school directors. Therefore, it is not adding new officers. The district superintendent would be responsible to this local board of education for his administrative duties. He is now responsible to the Education Department.

The plan of financing would equalize the taxes within the community district and would bring to rural districts ten million dollars aid from the State, of which the cities pay from 87 to 88 per cent.

These, then are the fundamental principles to be remembered in studying the bill. Practically all of the rest of the bill is details, the great majority of which is a re-write of the present law and is not new.

It is the aim of the bill to keep the boundaries of the rural schools as they are now, and to still maintain a local school in each district, unless the people themselves vote for a change, and at the same time, to give rural people a better system of administering and financing the schools so that they themselves may gradually and slowly bring about whatever improvement they think is needed. If, after these principles are understood, the people of the State do not wish the bill passed, we hope it will be defeated, but we do not think the rural folks will in the end base their judgment on so important a matter upon the prejudiced arguments that some are making who seem to be more interested in writing or saying something that will make a sensation than they are in the best interests of country children.

American Agriculturist believes in the rural school. It has turned out many thousands of the country's most capable and best men and women. We want to see it maintained and improved, for as yet no institution or individual has ever existed that did not present at least some opportunity for improvement. If those who are criticising the proposed Education Bill have a better plan, let them come forward with it. We fear they will find that no matter what the plan is on such a great issue, there will be many who oppose it. But if the plan is better, we will be for it.

Director Knapp at Farmingdale

IT now looks as though the rather stormy affairs which have prevailed for some time in the administration of the New York State School of Applied Agriculture at Farmingdale, Long Island, are to be succeeded by a more quiet period and more successful results for the farmers of Long Island, for the farmers of the State, and particularly for the boys and girls who will attend the school. Director H. B. Knapp, of the State School of Agriculture at Cobleskill, has resigned to accept the position as director of the State School of Applied Agriculture. If anyone can make a success at Farmingdale, Director Knapp can.

H. B. Knapp was a farm boy, coming originally from Cayuga County. After he was graduated from the Port Byron High School, he spent four years on the home farm and then attended and was graduated from the New York State College of Agriculture. After graduating, he became a specialist in the College fruit department. Then Mr. Knapp went to Cobleskill where he made that school an example of what can be done by these State schools for the young people who want to get as much training as possible in a short time to make them better farmers, home-keepers, and citizens.

We sympathize with the people of Schoharie County and Cobleskill in losing Director Knapp, and we congratulate the State School of Applied Agriculture and the farmers of Long Island in acquiring his services.

The American Agriculturist is preparing some illuminating articles showing how quacks and scoundrels get the investors' money under false pretenses. In this issue, we tell of some unpleasant experiences which our own subscribers have reported. In general when somebody promises something for nothing, or makes some glowing claim that common sense shows never can be fulfilled, *Beware! Beware! Beware!*

Where we love is home,
Home that our feet may leave, but not
our hearts,
Though o'er us shines the jasper-lighted
dome:—
The chain may lengthen but it never
parts! —OLIVER WENDELL HOLMES

Is Cooperative Marketing Here to Stay?

The Mythical Meetings of a Mythical Board of a Mythical Cooperative

EDITOR'S NOTE: This is the second act in the cooperative play which we started in our November 17 issue. If you read any of these acts, we request that you read them all, and watch how the farmers' business methods improve as they continue to work and do business together.

Act 2—THE SECOND MEETING OF THE BOARD.

THE time is February, 1923; the place, the office of the general manager; the characters the same as in the first meeting of the board.

President: Come to order, gentlemen. Call the roll, Mr. Secretary.

The secretary notes those in the room and reports all present except the always Absent Director and the Fat Director who is visiting with the telephone operator in the next room. The Director Who Doesn't Smoke calls him. He comes in smiling, sits down in the corner, selects a fat cigar, lights it, and puts his feet up on a chair.

President: The secretary will now read the minutes of our last meeting.

The secretary rummages through a mass of papers and after a minute or too of frenzied search appeals to the stenographer who goes into the outer office and returns with the Minute Book. The secretary reads.

President: You have heard the reading of the minutes. What is your pleasure, gentlemen?

The Lean Director: With reference to the authorization for the purchase of a tire for an automobile, did we not specify a tube for a Ford automobile?

President: You are right.

Secretary, shielding the stenographer: My mistake, gentlemen.

President: Do you accept the minutes as corrected?

The Hurried Director: I move that they be accepted.

The Businesslike Director: I second the motion.

The President: All in favor say Aye. Ayes have it. We will now receive the General Manager's report.

General Manager rises and passes around a typewritten report. The directors receive it and start looking through it as the General Manager begins to read.

The Businesslike Director: Inasmuch as the General Manager has presented a written report, I move you that he be excused from the room and that the report be read by the secretary.

The Hurried Director: Second the motion.

President: Any discussion? If not, all in favor of the motion, say Aye.

The General Manager, recovering from his daze: Gentlemen, I believe you have done the right thing. If you desire any explanation of the report I will be glad to come in and give it. I hope you will give it your careful consideration.

General Manager goes out. Stenographer wriggles in her chair and looks inquiringly at the president.

President: Miss Howe, we will excuse you too.

Miss Howe goes out, undecided as to whether she is relieved or angry.

President: Mr. Secretary, will you read our manager's report.

The Secretary reads: On the last page of the report is a budget for the operation of the organization for 1923.

At this point the Fat Director begins to doze. The Suspicious Director gets out a pencil and begins to figure on the item for automobiles. The Hurried Director gets ready to make a motion. The director who plays politics whispers to the "Me-Too" Director. The other directors busy themselves with a three-cornered conversation on deer hunting.

The Businesslike Director stands up: Mr. President, it seems to me that in the consideration of this budget this board has a most important task at hand. I believe that our General Manager is to be commended for having worked it out. It

By THE SILENT DIRECTOR strikes me as a most meritorious change from the haphazard way in which we have been doing business. Would it not be a good thing to call him in and go over the budget item by item.

The Lean Director: Yes, I believe we should. The item for automobiles looks to me to be entirely too high.

The Hurried Director: What's the use? He's probably figured as close as he can. We don't know anything about it.

President: I believe that the suggestion is well made. If you have no objection gentlemen I will ask the General Manager to return and we will take the rest of the day for the consideration of his budget.

The Nervous Director jumps up and goes in search of the manager, returning with him. At this point the telephone operator reports a telephone call for the Fat Director. He leaves the room beaming.

President: Mr. Manager, the Board is very much pleased with your idea of budgeting our expenses for this year. There are a good many items which we do not understand and some which appear to us to be too high. Won't you take all the time that is necessary and go over the entire budget with us, item by item?

The General Manager: I shall be glad to do so. The first item is for directors' expenses; the second for expenses of the executive committee; the third for the president's salary.

At this point the Fat Director returns. He appears somewhat crestfallen.

The Businesslike Director: What does your item for directors' expenses include?

The General Manager: It includes the average expense account per meeting of the directors and a per diem of \$10 a day.

The Businesslike Director: I am wondering, gentlemen, if a \$10 per day is entirely satisfactory to all members of the Board. As far as I am concerned I am satisfied with it, but it represents a money sacrifice.

The Lean Director: I don't be-

lieve the farmers would stand for any more.

The Fat Director: Well, it's enough anyway.

The question is dropped. The president's salary item is reached. The president seems embarrassed. The Businesslike Director seems on the point of discussing it, notes the president's embarrassment, and changes his mind. The General Manager goes on down through the items. The salary for office help is reached.

The Lean Director: Gentlemen, it seems to me that we are paying these girls entirely too much money and that they are not working long enough hours.

The General Manager starts to speak.

The Fat Director takes a questioning squint at the parsimonious one. The "Me-Too" Director nods his head. The air is a bit tense.

The Businesslike Director interrupts: Wait a minute. Let's get at the facts. What is the wage scale here? How do our wages compare with it? Are our working hours the same as in other offices here? Have we competent office help? It seems to me that these are points to be considered.

The Fat Director nods his head. The "Me-Too" Director nods his.

At this point the Director Who Doesn't Smoke ejaculates: Thunder, why pick on the girls? For my part it looks to me as though they earn their money.

The General Manager subsides. The president looks inquiringly around the room and then nods to the manager to go on with the next item. The General Manager concludes.

The Businesslike Director figures for a moment. He and the Suspicious Director are the only ones who have kept their budget constantly before them. Looking over his glasses, he begins: Gentlemen, take item No. 7: the matter of interest

(Continued on page 379)

The Cast of Characters

The Fat Director—Tells stories, reports executive sessions

The Lean Director—Suspicious and parsimonious; strong for executive sessions

The Director Who Doesn't Smoke—Grouchy; seconds motions

The Hurried Director—Careless and restless; makes motions

The Judicial Director

The Director Who Plays Politics—Always whispering in the corner

The Silent Director

The Always Absent Director

The Nervous Director—Secretary

The "Me-too" Director

The Businesslike Director—Treasurer; analytical; constructive

The Director Who Doesn't Count—In over his head

The General Manager—Nervous, aggressive, keen, very prone to quick decisions

The Attorney—Founded on precedent

The Stenographer—Young and pretty and efficient

Time: February, 1923

Place: Office of the General Manager

SAVE MONEY

Liberal discounts on early orders. Buy now and save money. Then you'll save more in the future because the Craine *three wall* construction lasts longer; saves repairs and keeps silage better. Waterproof, frost-defying, air-tight Silafelt covers the inside wall of upright staves. Outside, the continuous Crainelox Spiral Hooping binds the whole silo into smooth, handsome structure of giant strength. Every square inch cross supported.

Or, rebuild an old stave silo the superior Craine way at half the cost of a new silo.

Write for illustrated catalog with important silo information. Get our special discount. Do it now. Time payments if desired.

all profits go back to the growers in better prices; third, limit the members to farmers only; fourth, have long time, strong, written contracts; fifth, pool returns; sixth, have democratic control; seventh, hire the best experts that can be obtained as employees.

The second day sessions were devoted almost entirely to business affairs of the Farm and Home Bureau Federations. The following officers were elected:

Officers of Farm Bureau Federation

Enos Lee, Yorktown Heights was re-elected president. The other officers are E. W. Miller, Owego, first vice-president; Peter G. Ten Eyck, second vice-president; R. M. Thompson, St. Lawrence Co., treasurer; Thomas McKeary, Erie Co., director for four years. The delegates to the annual meeting of the American Farm Bureau Federation are Enos Lee and Frank Smith, Springfield Center. Their alternatives are Charles Porter and S. L. Strivings.

Officers of Home Bureau Federation

Mrs. A. E. Brigden, Marathon, the retiring president, was elected honorary president. Mr. G. T. Powell, Glen Head was elected president. The other officers are Mrs. James Morse, Levanna, first vice-president; Mrs. Cola Fountain, Evans Mills, second vice-president; Dr. Ruby G. Smith, Ithaca, secretary; Mrs. Eugene Baker, Ithaca, treasurer. Mrs. B. W. Miller of Tioga County succeeds Mrs. Edward Young of Milton, as director.

Many Resolutions Passed

The important resolutions follow:

A MARKETING PROGRAM

WHEREAS, more than half the farm problems of to-day concern marketing, the methods of marketing New York farm products are in a process of evolution, a part of our farmers are endeavoring to apply here the cooperative method of marketing that has proved efficient and successful in other States and in other countries. It is extremely important that ample time and fair opportunity be given for these attempts. It would be calamitous if even one of the State-wide cooperatives should collapse. The whole movement might be set back a generation.

To safeguard the situation, *Be It Resolved*, that

1. A systematic continuing program of education for farmers on the fundamentals of real cooperation, and
2. A similar educational program for the general public, especially the business interests, be instituted through a paid leader supported by all interested agencies.

A T B POLICY

Resolved, that the present Bovine Tuberculosis Committee be made a permanent committee whose personnel may be changed from time to time as circumstances may require and that we request the continued endorsement of this committee by the Agricultural Conference Board in order that this committee may have authority to be the official head and have in charge the general management on behalf of the farm organizations of the work of Bovine Tuberculosis Eradication in the State.

Be It Further Resolved, that we request the Farm Bureaus of all counties doing Bovine Tuberculosis Eradication work that they shall appoint a committee who shall report to this committee from time to time regarding the progress and development of the work in their respective counties.

FOR A HORTICULTURAL BUILDING

WHEREAS, the buildings used at the State Fair to house Farm Produce, Fruit and County Farm and Home Bureau exhibits are absolutely unfit in every way for exhibit purposes of this kind, and

WHEREAS, it was planned to build a Horticultural Building for 1923 exhibits, and

WHEREAS, the Coliseum was built for the National Dairy Show instead.

Be It Further Resolved, that we the members of the State Farm Bureau Federation at its annual meeting held at Syracuse on the 20th and 21st day of November, 1923, do hereby ask the State Legislature to provide sufficient funds and erect a Horticultural Building for 1924.

It Is Also Resolved, that the president of the State Farm Bureau Federation appoint a committee to meet with other State organizations for the cooperative work necessary for the planning of such a building.

WARNING AGAINST IMPORTED CLOVER

WHEREAS, there is danger of the farmers of this State suffering a serious loss by the purchase of imported clover seed,

Be It Resolved, that the N. Y. State College of Agriculture be requested to join with the U. S. Department of Agriculture and other State colleges in vigorously warning our farmers of the danger of loss by using imported clover seed.

EXTEND INSPECTION OF PERISHABLES

WHEREAS, shipping-point inspection of a few perishables has been made possible in a limited way in this State,

WHEREAS, this service has proven of exceptional value to the shippers in protection against unjustified rejections at destination, in developing and maintaining standards of grades among the producers and in providing a true basis upon which satisfactory business ethics may be safely built,

Resolved, that the State Legislature be asked to appropriate such funds as are, in the

Beyond the dreams of the Pioneers

Of the mile-long, high-level bridge now being built across the Hudson near Albany on the New York Central, the New York World says:

"The great cut-off at Castleton on the Hudson * * * will be a boon to all the people of New York State and to five times as many beyond its borders. * * *

"The Castleton cut-off is a notable example of those modern railway problems which concern rather improving old lines than the opening of new ones, for the cheaper movement of traffic grown vast beyond the dreams of the pioneers."

From a drawing made at Castleton, Sept., 1923, by Herbert Morton Stoops.

Hay shortage worrying you?

Don't let shortage of hay or corn silage worry you. Experiment stations and wide investigation have found a wonderful substitute. This year

Use DRIED BEET PULP Instead of hay or corn silage

In tests, 5 pounds of dried beet pulp have replaced 10 pounds of mixed hay. It costs no more and increases milk yield 2 to 5 pounds a day. In other tests, 1 pound of Dried Beet Pulp replaced 5 pounds of corn silage. It produced 10% more milk and improved health of cows. Feed Dried Beet Pulp. It is the Sugar Beet, dried, after the extraction of the sugar. It is a succulent, palatable, nutritious and wholesome vegetable feed and means bigger profits.

Among the Farmers

New York Youngsters Win Trip to Apple Show

ONE of the events which took place on November 9, Marketing Day at the Eastern Apple Exposition and Fruit Show, was the awarding of prizes by Irving T. Bush, president of the State Chamber of Commerce, New York City, to the winning boys and girls in the essay contests on production, marketing and uses of apples. Eight boys and girls from the schools of up-State New York attended the show on this day and were presented with prizes.

These contests were made possible by the cooperative efforts of the State Chamber of Commerce of New York City and the State Education Department. The Chamber of Commerce set aside \$1,000, \$600 of which was used as prizes for the winning essays and \$400 was used in paying the expenses of the two highest winners in each class from their homes over the State to New York City and the Apple Show.

The State Education Department in conducting this contest arranged four classes of essays for different groups

boys and girls receiving their prizes from the hand of Mr. Bush. Left to right they are: Hubert Young of Jordan high school; Charles Hawkins of Victor; Irving Crandall of Albion agricultural department and Donald Terhune of State School of Agriculture, Cobleskill. In the front row are Mary McLouth, district school at Shortsville; Florence Anderson, department of homemaking of Mayville; Dorothy Griffing of the Newark, N. Y., home-making department and Cecila Burke, district school pupil at South Bristol.

L. W. CRITTENDEN APPOINTED DIRECTOR AT COBLESKILL

Lee W. Crittenden, formerly county agricultural agent of Albany County, N. Y., has been appointed director of the New York State School of Agriculture at Cobleskill to succeed Director H. B. Knapp, who has been appointed to the chair of director of the New

Here are the boys and girls who were awarded prizes for the best essays on orcharding. They are, left to right: back row; Hubert Young, Charles Hawkins, Irving Crandall, Donald Terhune; front row; Mary McLouth, Florence Anderson, Dorothy Griffing, Cecila Burke. Irving T. Bush, President of the Chamber of Commerce, which donated the prizes, is on the extreme right

of boys and girls studying agriculture and homemaking in the schools of the State. Class A was arranged for boys studying vocational agriculture in high-school departments and in State schools of agriculture, who had for their subject, "Improving Methods of Marketing Apples in New York." Class B was for girls studying homemaking in high school departments and State schools of agriculture who were assigned the subject, "The Place of Eastern Grown Fruit and Fruit Products in the Family Diet." Class C was open to boys enrolled as junior project workers in agriculture and Class D for girls in junior projects in homemaking. These elementary schoolboys wrote on "Improving My Home Apple Orchard" and the girls the "Place of Apples in the Family Diet."

Twenty-eight prizes were given ranging from \$50 for first prizes in Classes A and B to \$5 for the last place in all classes.

The interest taken in the contest was keen. This was especially so among the boys studying vocational agriculture in high-schools and State schools. In this class alone fully 500 papers were written. In the preparation which the pupils in all classes made in preparing themselves for the writing of these essays they gained much of educational value concerning the production of apples, the marketing of apples and the wider uses which should be made of apples in New York State homes. From this standpoint alone the contest was more than worth while. For the eight winners who were taken on the trip to New York City, the return which they received on the trip should be an inspiration to them in undertaking further worth-while ventures. In the accompanying picture taken at the Apple Show are shown these

York State School of Agriculture at Farmingdale, L. I.

Mr. Crittenden was born and reared on a farm in Oswego, Pa. where he attended the elementary and secondary schools. In 1909 he was graduated from the State Normal School at Mansville, Pa. immediately entering the New York State College of Agriculture at Cornell from which in 1913 he received his B.S. degree. After leaving Cornell he was appointed instructor in agriculture at the State Normal School at Cortland, N. Y.

In February 1917 he took charge of the Department of Agriculture at the Randolph, N. Y. High School. In March of the following year he became county agricultural agent of Middlesex County, N. J. and remained there for about a year and a half, coming to Albany County, N. Y. as county agent in October 1919.

Mr. Crittenden's experience fits him admirably for the position as director of the State School at Cobleskill, to which he was unanimously elected by the Board of Trustees at the School at their meeting in October.

AGRICULTURAL TEACHERS TO CONVENE IN BUFFALO

National and State leaders, directors, supervisors, teachers and others interested in agricultural instruction will discuss their problems at sectional meetings held in connection with the 17th annual convention of the National Society for Vocational Education to be held at Buffalo, New York December 6, 7, and 8.

The plans for the convention include a schedule of visits to nearby high schools where agriculture is taught as a part of the regular curriculum.

National Grange Holds Meeting at Pittsburg

THE 57th annual session of the National Grange has been marked by large attendance and unusual interest. The seventh degree was conferred on a class of 3,993 persons Friday. Members witnessed this ceremony in Motor Square Garden.

Business sessions were held in Memorial Hall, the Master of the National Grange, S. J. Lowell, presiding.

Election of officers on Tuesday, November 20th, resulted as follows:

Master—Louis J. Taber, Barnesville, O.
Overseer—B. John Black, Randallstown, Md.
Leeturer—Orlando L. Martin, Plainfield, Vt.
Steward—Herman Ihde, Neenah, Wis.
Asst. Steward—Allen B. Cook, Niantic, Conn.
Chaplain—Rev. W. W. Deal, Nampa, Idaho.
Treasurer—Robt. P. Robinson, 501 Market Street, Wilmington, Del.
Secretary—C. M. Freeman, Tippecanoe City, O.
Gate Keeper—J. H. Hutchinson, Brookings, S. D.
Ceres—Mrs. W. Graee Sawyer, Atkinson, N. H.
Pomona—Mrs. Isabelle C. Chapman, West-erly, R. I.
Flora—Mrs. Georgia Johnson, Boaz, W. Va.
Lady Assistant Steward—Mrs. Cora Agans, Three Bridges, N. J.
Member Executive Committee—Leslie R. Smith, Hadley, Mass.

The new National Master, Louis J. Taber, was for six years Master of the Ohio State Grange and for two years Secretary of Agriculture in the Cabinet of Governor Davis of Ohio. He succeeds S. J. Lowell, who has served two terms or four years. The Executive Committee for the ensuing year will consist of W. J. Thompson of Maine, E. A. Eckert of Illinois and Leslie R. Smith of Massachusetts, the same as this year.

The Pennsylvania State Grange, which was the host of the National Grange, met in Pittsburg in a largely attended session November 12th, 13th and 14th and conferred the sixth degree on a large class on November 15th. They also gave a banquet for the visitors with Worthy Master McSparran as Chairman, Louis J. Taber of Ohio, Toastmaster, and Governor Pinchot and National Master Lowell, as principal speakers. The State Grange also furnished a Thursday evening program of pageants—illustrating Grange history and Grange work.

Reports of State Masters gave evidence of increasing Grange activity in community service, cooperative effort and beneficial legislation. The corporation tax law in Pennsylvania, defeat of old age pension legislation in Ohio, Pure Milk and Anti-Filled Milk Laws at Washington and in various States, the income tax law in Oregon and good roads in various States are illustrations.

The report of the legislative representative at Washington, D. C., Dr. T. C. Atkeson, was presented, showing continued effective action and cooperation with government departments and with other farm organizations. The Filled Milk Act, The Standard Container Act, Amendments to the Farm Loan Act and the Butter Standard Act were mentioned as accomplishments, also the defeat of the Sales Tax and of Ship Subsidy. Continued activity in support of the Truth-in-Fabrics Bill, more rigid enforcement of Prohibition, continued aid for good roads, protection of natural resources and greater economy and reduction of taxation were reported. The report contained a summary of Grange legislative work since its organization.

Secretary of Agriculture, Henry C. Wallace, spoke before a meeting of about 6,000 grangers on Thursday evening.

The Secretary told of the many lines of work of the department to aid agriculture, especially its aid and support of cooperative marketing. He gave details of improving agricultural conditions, but emphasized that much greater improvement must be brought about: "We depend on the Grange to bring us its best suggestions. We also depend on the Grange for advice and counsel to prevent unwise government activity," said the Secretary.

The Secretary and Treasurer's reports showed 45 new granges organized this year, 35 reorganized, 36 new Juvenile Granges, a total cash balance of over \$142,000 on hand, an increase of about \$7,000 in the year.

"I have been a subscriber to your paper since 1860."—H. V. N. Garrelson, R. D. No. 3, Somerville, N. Y.

As your foot leaves the ground—ankle, instep and toe are bent in action. A boot has no lacing in front, like a shoe, to give as you walk. The entire strain must be taken by the rubber itself.

In a fraction of a second your whole weight shifts to the ball of your foot—a strain that tests not only the rubber itself but the construction of the entire sole.

First, 150 to 200 pounds of weight comes down hard on the edge of your heel. Only the strongest reinforcements at the heel can stand the continued repetition of this blow.

Every step you take Here's what happens to your boots

Every step you take your boots meet two kinds of strain.

Kicking around the barnyard—ploughing through mud and slush—that's the kind of wear it takes *rugged strength* to stand up against.

Bending and wrinkling with every movement a thousand times a day—that's a strain that demands flexibility!

And that's why into "U. S." Boots is put rubber as *live and tough as an elastic band*.

Cut a strip of rubber from a "U. S." Boot—and you'd find it would stretch more than five times its length without breaking! This rubber has the flexibility to stand constant bending. It stays tough and pliable—resists strains and prevents breaking.

Anchored in this solid rubber is layer on layer of tough fabric reinforcements. In the places where the hard wear comes there are from 7 to 11 separate plies of rubber and fabric in "U. S." Boots.

Reinforcements that give rugged strength—rubber that stays tough and resisting—these are the reasons why "U. S." Boots mean longer wear and better service.

Other "U.S." Footwear

"U. S." Boots, built so strongly they're famous wherever boots are worn—Rubbers and Arctics all styles and sizes for the whole family—"U. S." Bootees, the all-rubber lace shoes for spring and fall use—every kind of rubber footwear is included in the big "U. S." line. Look for the "U. S." Trademark.

United States Rubber Company

"U.S." Boots

More "Buy Back" Experiences

(Continued from page 370)

Association, for our last letter in July has remained unanswered.

Mr. M. of Pa. was promised \$9.50 for hares sent in March. He shipped another pair in April, before the check for the first pair ever reached him—in fact, it never did come. But when he complained about the second pair of rabbits, the company claimed that they had never been received.

On referring the case to us, Mr. M. spoke only of the hares shipped in March, for which he was owed \$9.50. In taking up the case with the firm, we therefore, asked only for the one overdue payment. The company replied that they had written Mr. M. that his rabbits never arrived and that, therefore, they were "at a loss to understand how Mr. M. can write as he does."

In other words, they ignored the claim for rabbits they had received and agreed to pay for, and dealt in their answer to us only with the second pair, which we had not mentioned.

A little correspondence with Mr. M. developed the fact that there were two pairs of rabbits and also that he had in the meantime traced the shipment and the express company had notified him that the second hares had been received and signed for by the Standard Food & Fur Association.

Armed with this information, we went back to the company, claiming \$19 for the two pairs. There the matter has rested, since last July. The firm ignored our letter setting forth all the facts and it is listed among unsettled claims on which we have done all we could to collect.

There is undoubtedly money in the rabbit business. Unfortunately, it seems to go largely in one direction. We should be interested to know whether any of our readers have had more pleasant experiences than those herein set forth, for so far we have not come into contact with anything but this type.

Opening the Door to Many Markets

(Continued from page 371)

as must be had by the manufacturer whose steady output warrants the employ of experienced salesmen throughout the year.

However, a cooperative organization cannot afford the cost of exclusive salesmen or salaried representatives upon all of the markets where its products should be sold.

Meeting the Short Season Problem

With this thought in mind the Marketing Committee of 21 of the American Farm Bureau Federation created the Federated Fruit and Vegetable Growers, which is a national, cooperative sales service, with representation on the carlot markets of the country. The Federated Growers came into existence on the first of this year by acquiring the full sales service, marketing contracts and personnel of the North American Fruit Exchange, which had been a national, privately owned sales service with 12 years experience in national distribution and selling.

Thus, at one stroke the growers of New York and New Jersey, as well as growers throughout the country, had at their disposal a non-profit, grower-owned and grower-controlled sales machine. The cooperative associations become members of the Federated as rapidly as they are prepared for the merchandising of their crops, and one member of the Federated may include any number of individual growers.

Following the calendar through a 12 months period, we find that the need of a national sales service on apples, potatoes and other late fall fruits and vegetables is followed by a similar need early in the year by the growers of Southern vegetables; later by the marketing needs of the strawberry growers in the early and intermediate States. Then, as the season advances, the same service is needed throughout the central and northern territory on a great variety of fruits and vegetables until the cycle of a year is completed. This balance of product sold by the Federated Growers keeps the sales personnel fully

Hardiness!

Every man who milks cows for a living knows that *Hardiness* is a necessary characteristic of a good dairy cow.

HARDINESS IN HOLSTEINS MEANS:

The ability to do well for the general farmer, as well as for the commercial dairyman.

The ability to readily adapt themselves to any climate and to profitably turn available farm feed into milk and butter-fat.

Let us tell you about Holsteins

Is Cooperative Marketing Here to Stay?

(Continued from page 373)

on indebtedness. It seems to me here is a place where we can make some savings. Take No. 11: appropriation for advertising. Personally I would not want to pass that item until I had a report on the results of our last advertising campaign. No. 17: office rent. I am wondering if we are not paying more for these offices than other concerns are paying for like space.

The Lean Director: Well now, take that automobile item. There is \$900 for one car.

The General Manager: Let me explain, Mr. President. \$300 of that item only is for maintenance. The other \$600 is for depreciation. In other words, if we allow \$900 for automobile maintenance we will keep our investment good through the repurchase each year of a new car.

The Lean Director: Oh!

The Nervous Director: I move we adopt the budget as presented.

The Businesslike Director: Now, gentlemen, don't get in a hurry. There are some items in the budget which don't look right to me. I think we have made a good beginning by having all our expense laid down before us, but I don't want to pass the thing as a whole. I suggest that we consider item by item, and that any items we are not sure about be laid on the table until our next meeting when additional information will be available.

The Lean Director: I believe you are right.

At this point the Fat Director receives another telephone call. He nods to the Director Who Plays Politics and they leave the room together.

The meeting is in confusion for a minute and the President raps sharply for order: Mr. Secretary, will you please ask the gentlemen to return to the room?

The Secretary goes into the outer office where the Fat Director is telephoning and sharing the receiver with his friend, the Director Who Plays Politics. Seeing the Secretary, the Fat Director cuts short his conversation and the three return to the inner office.

President: Gentlemen, I am going to expedite the adoption of this budget by having you vote Yes or No on it, item by item. Item No. 1: What is your pleasure? The ayes have it. Item No. 2: The ayes have it again. Item No. 3:

The Businesslike Director: I move that it be laid on the table.

President: So ordered.

The President continues throughout the budget. The Businesslike Director questions three items which are laid on the table.

President: What is your pleasure concerning the unadopted items of this budget?

The Businesslike Director: I move that we instruct the General Manager to furnish facts to each one of us immediately to substantiate the amounts budgeted so we may study them between now and the next meeting.

The Me-Too Director: I second the motion.

President: All in favor say Aye. Ayes have it.

The Fat Director glances at the clock. He nudges the politically inclined director.

The Director Who Plays Politics: I move that we adjourn.

The Me-Too Director: I second the motion.

The President starts to put the question but the Fat Director has already left the room. Gradually the members file out. There remain the Businesslike Director and the President.

President: Well, Joe, we made some progress to-day.

The Businesslike Director: Yes, Jim, I feel better about things.

Home Curing Pork—Instead of using nothing but salt in your pork curing this winter, try mixing a little sugar and saltpeter with the salt and see whether your hams and bacons will not taste better. The saltpeter causes the meat to hold its color, while the sugar prevents it from becoming hard and dry. For 100 pounds of meat, use twelve pounds salt, two pounds brown sugar and two ounces saltpeter.

My Engine Will Do the Work of 6

Try This Remarkable Engine FREE

There is no other farm engine like it. Simple in construction and easy to operate. It is only one engine, yet it takes the place of six engines. It will give from 1 1/2 to 6 H. P., yet it is so light that two men can carry it easily. Set it anywhere and put it to work.

Change Power as Needed

It is a 6 H. P. when you need 6, or 1 1/2 H. P. when you need only 1 1/2, or any power in between. Fuel consumption in proportion to power used and remarkably low at all times. Adjustment from one power to another is instantaneous.

Burns Kerosene

Operates with kerosene or gasoline. Easy starting, no cranking. The greatest gas engine

value on the market. And you can prove all of these statements to your own satisfaction.

What Users Say

Ivan L. Blake, of Hannibal, New York, says: "Only engine economical for all jobs. I run a 28-inch cord wood saw, a 24-inch rip saw, a washer, a pump, and a grinder, and it sure runs them fine. It has perfect running balance, and it sets quiet anywhere."

Clarence Rutledge, of Manitoulin Island, Ontario, says: "Have given my Edwards four years' steady work and like it fine. It uses very little fuel. I run a 28-inch cord wood saw, also a rip saw, 8-inch grader, ensilage cutter, line shaft for shop, churn, washer, separator and pump. Have had ten other engines and the Edwards beats them all."

Frank Foell, of Cologne, New Jersey, says: "It's a great pleasure to own an Edwards engine. I run a wood saw, cement mixer,

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."

—A. Y. EDWARDS

EDWARDS FARM ENGINE

threshing machine, etc. Do work for my neighbors. Easy to move around and easy to run. I would not have any other."

147 West 24th St. New York

LET US TAN YOUR HIDE.

Horse or Cow hide, Calf or otherskins with hair or fur on, and make them into coats (for men and women), robes, rugs or gloves when so ordered; or we can make your hides into Oak Tanned Harness or Slaughter Sole or Ball Leather; your calfskins into Shoe Leather. Colors, Gun Metal, Mahogany, Russet or lighter shade. Calfskins tanned in the lighter shades of shoe leather, also make elegant stand and table covers; great for birthday, wedding and holiday gifts.

LET US FIX YOUR WORN FURS

freshen, repair and reshape them if needed. Furs are very light weight, therefore it would cost but little to send them in to us by Parcel Post and get our estimate of cost; then we will hold them aside awaiting your decision. If you say "go ahead," very well; we will do so and hold them free of storage until you want them. If you say "no," we will return them post-paid.

Our illustrated catalog and style book combined gives a lot of useful information. It tells how to take off and care for hides. About our safe dyeing process on cow and horse hides, calf and fur skins. About dressing fine fur skins and making them into neckpieces, muffs and garments. About taxidermy and Head Mounting.

The Crosby Frisian Fur Company,

WILL SELL FINE OLD VIOLIN \$35. MRS. GEO. A. DEAN, R. F. D. 4, Medina, N. Y.

The Broad Highway—By Jeffery Farnol

CHAPTER XXI

IN WHICH I MEET WITH A LITERARY TINKER

EVEN in that drowsy, semi-conscious state, which lies midway between sleeping and waking, I knew it could not be the woodpecker who lodged in the tree above me. No woodpecker that ever pecked could originate such sounds as these—two quick, light strokes, followed by another, and heavier, thus: Tap, tap—TAP; a pause, and then, tap, tap—TAP again, and so on.

Whatever doubts I may have yet harbored on the subject, however, were presently dispelled by a fragrance sweeter, to the nostrils of a hungry man, than the breath of flowers, or all the vaunted perfumes of Arabia—in a word, the odor of frying bacon.

Hereupon, I suddenly realized how exceedingly keen was my appetite, and sighed, when a voice reached me from no great distance, a full, rich, sonorous voice, singing a song. And the words of the song were these:

A tinker I am, O a tinker am I,
A tinker I'll live, and a tinker I'll die;
If the King in his crown would change places
wi' me
I'd laugh so I would, and I'd say unto he:
'A tinker I am, O a tinker am I,
A tinker I'll live, and a tinker I'll die.'

It was a quaint air, with a shake at the end of the first two and last two lines, which, altogether, I thought very pleasing. I advanced, guided by the voice, until I came out into a grassy lane. Seated upon an artfully-contrived folding stool, was a man. He was a very small man, who held a kettle between his knees, and a light hammer in his hand, while a little to one side of him there blazed a crackling fire of twigs upon which a hissing frying-pan was balanced. But what chiefly drew and held my attention was the man's face; narrow and peaked, with little, round, twinkling eyes set deep in his head, close black hair, grizzled at the temples, and a long, blue chin.

"GOOD MORNING!" said he, with a bright nod.

"So then you did n't cut your throat in the Hollow Oak, after all?" said I. "Nor likely to either, master," he answered, shaking his head.

"But," said I, "some day or so ago I met a pedler of brooms."

"Gabbins Dick!" nodded the Tinker. "Who told me very seriously—"

"That I'd been found in the big holler oak wi' my throat cut," nodded the Tinker.

"But what did he mean by it?"

"Why, y' see," explained the Tinker, leaning over to turn a frizzling bacon-rasher very dexterously with the blade of a jack-knife, "y' see, 'Gabbins' Dick is uncommon fond of murders, soicides, and such like—it's just a way he's got."

"A very unpleasant way!" said I.

"A leetle weak up here," explained the Tinker, tapping his forehead with the handle of the jack-knife.

"Poor fellow!" said I, while the Tinker began his tapping again.

"Are you hungry?" he inquired suddenly, glancing up at me.

"Very hungry!" said I. Hereupon he set down his hammer, and, turning to a pack at his side, proceeded to extract therefrom a loaf of bread, a small tin of butter, and a piece of bacon, from which last he cut sundry slices with the jack-knife. He now lifted the hissing rashers from the pan to a tin plate, which he set upon the grass at my feet, together with the bread and the butter; and, having produced a somewhat battered knife and fork, handed them to me with another nod.

"You are very kind!" said I.

"Why, I'm a man as is fond o' company, y' see. I am—as you might say—a literary cove, being fond o' books, novels, and such like." And in a little while, the bacon being done to his liking, we sat down together.

"That was a strange song of yours," said I, after a while.

"I made the words myself," said the Tinker.

"And do you mean it?"

"Mean what?" asked the Tinker.

"That you would rather be a tinker than a king?"

"Why, to be sure I would," he rejoined. "Bein' a literary cove I know summat o' history, and a king's life were n't all lavender."

"Yet there's much to be said for a king."

"Very little, I think," said the Tinker.

"There have been some great and noble kings."

"But a great many more bad 'uns!" said the Tinker. "And then, look how often they got theirselves pisoned, or stabbed, or 'ad their 'eads chopped off!"

"Then you are contented?"

"Not quite," he answered, his face falling; "me being a literary cove (as I think I've mentioned afore), it has always been my wish to be a scholar."

"Far better be a tinker," said I.

"YOUNG fellow," said the Tinker, shaking his head reprovingly, "you're off the mark there—knowledge is power; why, Lord love my eyes and limbs! what's finer than to be able to read in the Greek and Latin?"

"To possess the capacity of earning an honest livelihood," said I.

"Why, I tell you," continued the Tinker, unheeding my remark, "I'd give this here left hand o' mine to be able to read the very words of such men as Plato, Aristotle, Epictetus, Xenophon, and all the rest of 'em."

"There are numerous translations," said I.

"You've read Epictetus, perhaps?" inquired the Tinker.

"I have."

"Not in the Greek, of course."

"Yes," said I, smiling, "though by dint of much labor."

The Tinker stopped chewing to stare at me wide-eyed.

"Lord love me!" he exclaimed, "and you so young, too!"

"But I can't make a kettle, or even mend one, for that matter," said I.

"But you are a scholar, and it's a fine thing to be a scholar!"

"And I tell you again, it is better to be a tinker," said I.

"That, I don't believe," said the Tinker.

"Nevertheless," said I, "speaking for myself, I have, in the course of my twenty-five years, earned but ten shillings, and that—but by the sale of my waistcoat."

"Lord love me!" exclaimed the Tinker, staring.

"A man," I pursued, "may be a far better scholar than I—may be full of the wisdom of the Ancients, and yet starve to death—indeed frequently does; but who ever heard of a starving Tinker?"

"You are a rather strange young man, I think," said the Tinker, as, having duly wiped knife, and fork, and plate upon a handful of grass, I handed them back.

"Yet you are a stranger tinker."

"How so?"

"Why, who ever heard of a tinker who wrote verses, and worked with a copy of Epictetus at his elbow?"

THE Tinker slowly wiped his clasp-knife upon the leg of his breeches, closed it, and slipped it into his pocket.

"Nevertheless," said he at last, "I am convinced that you are a very strange young man."

"Be that as it may," said I, "the bacon was delicious. I have never enjoyed a meal so much—except once at an inn called 'The Old Cock.'"

"I know it," nodded the Tinker; "a very poor house."

"But the ham and eggs are beyond praise," said I; "still, my meal here under the trees with you will long remain a pleasant memory."

"Good-by, then," said the Tinker.

"Good-by, young man, and I wish you happiness."

"What is happiness?" said I. The Tinker removed his hat, and, having scratched his head, put it on again.

"Happiness," said he, "happiness is the state of being content with one's self, the world, and everything in general."

"Then," said I, "I fear I can never be happy."

"And why not?"

"Because, supposing I ever became contented with the world, and every-

thing in general, which is highly improbable, I shall never, never be contented with myself."

CHAPTER XXII

WHICH INTRODUCES THE READER TO THE ANCIENT

THE sun was high when I came to a place where the ways divided, and I heard the cool plash and murmur of a brook at no great distance. Wherefore, being hot and thirsty, I scrambled through the hedge, and, coming to the brook, threw myself face down beside it, and catching up the sweet pure water in my hands, drank my fill; which done, I bathed my feet, and hands, and face. Now because I have ever loved the noise of running waters, in a little while, I rose and walked on beside the stream, listening to its blithesome melody. I came at length to a sudden declivity down which the water plunged in a miniature cascade, sparkling in the sun, and gleaming with a thousand rainbow hues. On I went, climbing down as best I might, until I found myself in a sort of green basin, very cool after the heat and glare of the roads. And there, screened by leaves, shut in among the green, stood a small cottage or hut. My second glance showed it to be tenantless, for the thatch was partly gone, the windows were broken, and the door had long since fallen from its hinges. Yet, despite its forlornness and desolation, there was something in the air of the place that drew me strangely.

"A man might do worse than live here," thought I, "with the birds for neighbors, and the brook to sing him to sleep at night."

I was still looking at the hut, with this in my mind, when I was startled by hearing a thin, quavering voice behind me:

"Be you 'm a-lookin' at t' cottage, master?"

TURNING sharp round, I beheld a very ancient man in a smock frock, who carried a basket on one arm, and leaned upon a stick.

"Yes," I answered; "I was wondering how it came to be built in such an out-of-the-world spot."

"Why, 't were built by a wanderin' man o' the roads."

"It's very lonely!" said I.

"Ye may well say so, sir—haunted it be, tu."

"Haunted?" said I.

"Haunted as ever was!" answered the old man, with a sprightly nod strangely contrasting with his wrinkled face and tremulous limbs. "No one ventur's nigh the place arter dark, an' few enough in the daytime."

"On account of the ghost?"

"Ah!" nodded the Ancient, "moans 'e du, an' likewise groans."

"Then nobody has lived here of late?"

"Bless 'ee, no. Nobody's come a-nigh the place, you may say, since 't were built by the wanderin' man."

Lived 'ere all alone, 'e did—killed 'isself 'ere likewise."

"Killed himself!" said I.

"Ah—! 'ung 'isself—be'ind th' door yonder, sixty an' six year ago come August, an' 't were me as found 'im."

Ye see," said the old man, seating himself with great nicety on the moss-grown doorstep, "ye see, 't were a tur'ble storm that night—rain, and wind, wi' every now an' then a gert, cracklin' flame o' lightnin'. Well, I were comin' 'ome, and what wi' one thing an' another, I lost my way. An' presently, as I were stumblin' along in the dark, comes another crackle o' lightnin', an' lookin' up, what should I see but this 'ere cottage. 'T were newer-lookin' then, wi' a door an' winders, but the door was shut an' the winders was dark—so theer I stood in the rain, not likin' to disturb the stranger, for 'e were a gert, fierce, unfriendly kind o' chap. Hows'-ever, arter a while, up I goes to th' door, an' knocks (for I were a strong, strappin', figure o' a man myself, in those days, an' could give a good buffet an' tak one tu), so up I goes to th' door, an' knocks wi' my fist clenched, all ready—but Lord! nobody answered,

so, at last, I lifted the latch." Here the Ancient paused to draw a snuff-box from his pocket, with great deliberation.

"Well?" I inquired.

"Well," he continued slowly, "I lifted th' latch, and give a push to the door, but it would only open a little way—an inch, p'r'aps, an' stuck." Here he tapped, and opened his snuff-box.

"Well?" I inquired again.

"Well," he went on, "I give it a gert, big push wi' my shoulder, an', just as it flew open, comes another flash o' lightnin', an' the fust thing I seen was—a boot."

"Go on," said I, "go on."

"Oh!—it's a fine story, a fine story!" he chuckled. "Theer bean't many men o' my age as 'as fund a 'ung man in a thunderstorm! Well, as I tell ye, I seen a boot, likewise a leg, an' theer were this 'ere wanderin' man o' the roads a-danglin' be'ind th' door from a stapil—look ye!" he exclaimed, rising with some little difficulty, and hobbling into the hut, "theer be th' very stapil,

WHAT HAS HAPPENED

PETER VIBART, rather than win a fortune by marrying a famous beauty whom he has never seen, takes to the Broad Highway. His remarkable resemblance to his rascally cousin, Sir Maurice, is responsible for several adventures, including an attack upon his life. He rescues a lady in distress returns her to her home, and continues on his way in search of honest employment.

so it be!" and he pointed up to a rusty iron staple driven deep into the beam above the door.

"And why," said I, "why did he hang himself?"

"Seein' e' 'ad no friends, and never told nobody—nobody never knowed," answered the old man, shaking his head, "but on that theer stapil I fund 'im, sixty and six year ago."

"Sixty and six years is an age," said I.

"So it be," nodded the Ancient. "I were a fine young chap in those days, tall I were, an' straight as a arrer. I be a bit different now."

"Why, you are getting old," said I.

"So 's t' stapil yonder, but t' stapil looks nigh as good as ever."

"Iron generally wears better than flesh and blood," said I; "it's only natural."

"Ay, but 'e can't last forever," said the Ancient, frowning, and shaking his head at the rusty staple. "I've watched un, month in an' month out, all these years, an' seen un growin' rustier an' rustier. 'I'll last 'ee out yet, I've said tu un—'e knows it—'e've heard me many an' many a time. 'I'll last 'ee out yet!' I've said, an' so I will, tu—'e can't last forever an' I be a vig'rus man—a mortal vig'rus man—bean't I?"

"Wonderfully!" said I.

"An' t' stapil can't last much longer—eh, maister?"

"One would hardly think so."

"I knowed it—I knowed it," he chuckled, feebly, "such a poor old stapil as 't is, all eat up wi' rust. Every time I come 'ere a-gatherin' watercress, I come in an' give un a look, an' watch un rustin' away; I'll see un go fust, arter all, so I will!" and, with another nod at the staple, he turned, and hobbled out into the sunshine.

And seeing how, despite his brave showing, he labored to carry the heavy basket, I presently took it from him, disregarding his protests, and set off by his side; yet, as we went, I turned once to look back at the deserted hut.

"You 'm thinkin' 't is a tur'ble bad place at night?" said the old man.

"On the contrary," I answered, "I was thinking it might suit a homeless man like me very well indeed."

"D' ye mean—to live there?" exclaimed the Ancient.

"Yes," said I.

"P'r'aps you be one o' they fules as think theer bean't no ghosts?"

"As to that," I answered, "I don't know, but I don't think I should be much afraid, and it is a great blessing

Give a thought to Advertising

THE following narrative was printed lately in Capper's Weekly, and it is repeated here for its wholesome moral: Back in the early days of the civil war Henry Webb, age fifteen, enlisted with the 1st New York Light Artillery and was away from friends and home and lonesome. So he decided to take a chance. He sent a two-line advertisement to the Literary Companion, asking if some girls would write to him "just for the fun of matrimony." Susan E. Sharp, a typesetter on the paper, set the ad. She wasn't lonesome, but she was patriotic. So she wrote to the soldier boy. For sixteen months they exchanged letters. In 1863 Henry obtained a furlough. He hurried to the little town where Susan lived. Within fifteen days they were married. Then the young bridegroom went back to his regiment with a new incentive to bring the war to a close. He fought in thirty-seven battles to do this. They have just celebrated their sixty-first wedding anniversary. It pays to advertise for a wife when the ad brings sixty-one years of happiness.

The romance of Henry and Susan, woven by the silver thread of sentiment, tells a cryptic story. Henry might have been just a bachelor had he failed to make known publicly his wants. Susan might have remained a spinster. She took a chance and won a home. This event may be considered romantic or sentimental. It is rather an "ad" mission of an "ad." In a just-for-play mood Henry did that which brought him sixty-one years of happiness. What "play" could be more remunerative than such "ad" play.

Once in cold type, the commercial "ad" becomes a vital force for business expansion. The dividend on an "ad" investment exceeds expectations. Advertising introduces producer and consumer. It is the point of contact. What of the expense? The cost is nominal compared with the returns for the financial outlay. The farmer's activities are controlled by seasons. He plants, reaps, gathers into his barn—all by the seasons. "He that tilleth his land shall have plenty of bread." Advertising is not so governed. It is an all-season commodity. It survives the storm, and is aggressive in spring, summer, autumn and winter. It is the printed word which approaches the quiet hour with an appealing, persuasive voice. It is your counsellor. It is not what you get out of advertising but what you manage to get into it that makes produce move from the farm to the wholesaler; from the wholesaler to the merchant; from the merchant to the retailer; from the retailer to the consumer. It has been said—and in truth—"Whether you are in business or politics you should always remember that persistent advertising will make any man great." It sells as well as farm products. The spoken salesman does a vast amount of good but the contact-drawing power of the "silent salesman" is not to be discounted as a trade builder.

A circulation medium, with year-long stockholders, cannot fail to benefit all subscribers—whether they be just readers or active advertisers. Such a partnership cannot fail. Fundamentally and progressively it represents strength—personified. It is circulation which keeps the body fit. It is circulation which keeps the magazine fit. Our soliciting representative is within reach. Give him the "glad hand." Further his ends by improving your own. Let's get together in a common enterprise which will be for mutual profit. "What has happened in the past should sound a warning for the future."

Will you please say to your neighbor—"I saw it in the American Agriculturist." This will help you commercially and productively.

"It pays to advertise." Think of Henry and Susan! Sixty-one years of happiness! Brought about by an "ad!"

Advertising Manager

to have some spot on this unfriendly world that we can call 'home'—even though it be but a hut, and haunted."

In a little while the path we followed led up a somewhat steep ascent; seeing which, I put out a hand to aid my aged companion. But he repulsed me almost sharply:

"Let be," he panted, "let be, nobody's never 'elped me up this 'ere path; an' nobody never shall!" So up we went, the Ancient and I, side by side, and very slowly, until, the summit being reached, he seated himself, spent and breathless, upon a fallen tree, which had doubtless served this purpose many times before, and mopped at his wrinkled brow with a trembling hand.

"Ye see," he cried, as soon as he had recovered his breath sufficiently, "ye see, I be wunnerful spry an' active—could dance ye a hornpipe any day, if I was so minded."

"On my word," said I, "I believe you could! But where are you going now?"

"To Siss'n'urst!"

"How far is that?"

"'Bout a mile acrost t' fields."

"Is there a good inn at Sissinghurst?"

"Ay, ay," nodded the old man, "if it be good ale an' a comfortable inn you want you need seek no further nor Siss'n'urst; ninety an' one years I've lived there, an' I know."

"Ninety-one years!" I repeated.

"As ever was!" returned the Ancient, with another nod. "I be the oldest man in these parts 'cept David Relf, an' 'e died last year."

"Why then, if he's dead, you must be the oldest," said I.

"No," said the Ancient, shaking his head, "ye see it be this way: David were my brother, an' uncommon proud 'e were o' bein' the oldest man in these parts, an' now that 'e be dead an' gone it du seem a poor thing—ah! a very poor thing!—to tak' 'vantage of a dead man, an' him my own brother!" Saying which, the Ancient rose, and we went on together, side by side, towards Sissinghurst village.

CHAPTER XXIII

OF BLACK GEORGE, THE SMITH, AND HOW WE THREW THE HAMMER

"THE BULL" is a plain, square, whitewashed building, with a sloping roof, and before the door an open portico, wherein are set two seats from which one may watch the winding road, the thatched cottages bowered in roses, or the quiver of distant trees. Or one may close one's eyes and hark to the chirp of the swallows under the eaves, the distant lowing of cows, or the clink of hammers from the smithy across the way.

And presently, as we sat there drowsing in the sun, to us came one from the "tap," a bullet-headed fellow, somewhat fat and fleshy—who, having nodded to me, sat him down beside the Ancient, and addressed him as follows:

"Black Jarge be 'took' again, Gaffer!"

"Ah! I knowed 't would come soon or late, Simon," said the Ancient, shaking his head.

"Seemed goin' on all quiet and reg'lar, though," said the bullet-headed man, whom I discovered to be the landlord of "The Bull"—"seemed nice and quiet, when, 'bout an hour ago it were, 'e ups and heaves Sam out into the road."

"Ah!" said the old man, nodding his head again, "to be sure, I've noticed, Simon, as 't is generally about the twentieth o' the month as Jarge gets 'took.'"

"'E've got a wonderful 'ead, 'ave the Gaffer!" said Simon to me.

"Yes," said I, "but who is Black George; how is he 'taken,' and by what?"

"Gaffer," said the Innkeeper, "you tell un."

"Why, then," began the Ancient, nothing loth, "Black Jarge be a gert, big, strong man—the biggest, gertest, and strongest in the South Country, d'ye see (a'most as fine a man as I were in my time), and, off and on, gets took wi' tearin's and rages, at which times 'e don't mind who 'e 'its—"

"No—nor wheer!" added the Innkeeper.

"Oh, 'e be a bad man, be Black Jarge when 'e's took, for 'e 'ave a knack of takin' the one highest, and a-heavin' of un over 'is 'ead."

"Extremely unpleasant!" said I.

"Just what he done this mornin' wi'

Sam," nodded the Innkeeper—"hove un out into the road, 'e did."

"And what did Sam do?" I inquired.

"Oh! Sam were mighty glad to get off so easy."

"Sam must be a very remarkable fellow—undoubtedly a philosopher," said I.

"'E be nowt to look at!" said the Ancient.

Now at this moment there came a sudden deep bellow, a hoarse, bull-like roar from somewhere near by, and through the wide doorway of the smithy opposite, I saw a man come tumbling, all arms and legs, who, having described a somersault, fell, rolled over once or twice, and sitting up in the middle of the road, stared about him in a dazed sort of fashion.

"That 's Job!" nodded the Ancient.

"Poor fellow!" said I, and rose to go to his assistance.

"Oh, that were n't nothin'," said the Ancient, laying a restraining hand upon my arm, "nothin' at all. Job bean't 'urt; why, I've seen 'em fall further nor that afore now."

AND, in a little while, Job arose from where he sat in the dust, and limping up, sat himself down on the opposite bench, very black of brow and fierce of eye. And, after he had sat there silent for maybe five minutes, I said that I hoped he was n't hurt.

"'Urt?" he repeated, with a blank stare. "Ow should I be 'urt?"

"Why, you seemed to fall rather heavily," said I.

At this Job immediately turned his back upon me; from which, and sundry winks and nods from the others, it seemed that my remark had been ill-judged. And after we had sat silent for maybe another five minutes, the Ancient appeared to notice Job's presence for the first time.

"Why, you bean't workin' 's arternoon then, Job?" he inquired solemnly.

"Ah! I'm done wi' smithin'—least-ways, for Black Jarge."

"And him wi' all that raft o' work in Job? Pretty fix 'e 'll in wi' no one to strike for 'im!" said Simon.

"Serves un right tu!" retorted Job, furtively rubbing his left knee.

"But what 'll 'e do wi'out a 'elper?" persisted Simon.

"Lord knows!" returned the Ancient; "unless Job thinks better of it."

"Not me," said that individual, feeling his right elbow with tender solicitude. "I'm done wi' Black Jarge, I am. I never swing a sledge for Black Jarge again—danged if I du!"

"And 'im to mend th' owd church screen up to Cranbrook Church," sighed the Ancient; "a wunnerful screen, a wunnerful screen! older nor me—ah! a sight older—hunneds and hunneds o' years older—they would n't let nobody touch it but Black Jarge."

"'E be the best smith in the South Country!" nodded Simon.

"Ay, an' a bad man to work for as ever was!" growled Job.

"'T would ha' been a fine thing for a Siss'n'urst man to ha' mended t' owd screen!" said the Ancient.

"'T would that!" nodded Simon, "a shame it is as it should go to others."

HEREUPON, having finished my ale, I rose.

"Be you 'm a-goin', young maister?" inquired the Ancient.

"Why, that depends," said I. "I understand that this man, Black George, needs a helper, so I have decided to offer my services."

"You!" exclaimed Job, staring in amazement, as did also the other two.

"Why not?" I rejoined. "Black George needs a helper, and I need money."

"My chap," said Job warningly, "don't ye do it. You be a tidy, sizable chap, but Black Jarge ud mak' no more o' you than I should of a babby."

"Better not," said Simon.

"On the contrary," I returned, "better run a little bodily risk and satisfy one's hunger, rather than lie safe but famishing beneath some hedge or rick—what do you think, Ancient?"

The old man leaned forward and peered up at me sharply beneath his hanging brows.

"Well?" said I.

"You 'm right!" he nodded, "and a man wi' eyes the like o' yourn bean't one as 't is easy to turn aside, even though it do be Black Jarge as tries."

"Then," said Job, as I took up my

(Continued on page 385)

What Is This Dress Worth?

Before you guess I want you to know that the dress sparkles with richest style—a duplicate in design of an expensive Parisian gown at a price you will hardly believe possible!

By Virginia Castleton
Visualize yourself in this beautiful frock of soft, shimmering Egyptian silk Paisley and Navy Blue Longwear Gabardine Serge! See yourself the envy of all in this lovely creation showing the deft touches of gifted French designers. Recreated under my personal direction. Mannish type collar, tiny vestee (button trimmed) and cuffs of Serge. Soft all around girde with loose tie sash. The beautiful skirt has the newest touch—1/2-inch knife pleats all around—a feature found on all of the new importations. Waist and skirt both cut full for perfect fitting to all types of figures—a clever feat of tailoring! Even older women may wear it!

And Now for a Pleasant Surprise!
What is my price? Might I ask you \$9 or \$12 or \$17? Is such elegant style not worth it? But, my dear, you shall not pay a single cent additional for the extras in style, because my price is only \$3.99! Yes, that is all. Would you ever dream it possible! But you will not fully believe or appreciate until you see it. Try it entirely at my risk—because my company guarantees you absolute satisfaction! But be quick! This amazing offer can't be open long. And I do so want every woman in America to have one.

SEND NO MONEY

Just write me giving your size. I will then send you this fine dress. Pay the mailmen only \$3.99 and postage when it arrives. Try it on and then if you don't think it the most lovely dress you ever saw and the biggest bargain of your life I will return every cent of your money.

Make Your Christmas Gifts

Patterns For Plain Sewing and Gay Embroidery Too

Play rompers are a boon to the busy mother and **No. 1890**, besides being a pretty little style, has useful features to recommend it. A gay binding and a touch of embroidery makes it a Christmas gift acceptable both to mother and the young hopeful.

No. 1890 comes in sizes 1, 2, and 4 years. For the 4-year size, $1\frac{1}{8}$ yards of 36-inch material is required. **Price 12c.** Embroidery **No. 674**, 12c extra.

THE hand-made present is always the most welcome and appropriate Christmas remembrance, for the very idea of Christmas is the personal thought. No design on this page is hard to make; many are simple even for beginners. Our patterns are inexpensive, save material, show the newest styles and are guaranteed to fit.

Bobby and Jane won't start giving reasons why they shouldn't go to bed on Christmas eve if the new embroidered nightie is produced at the right moment. Flannelette makes a warm little set of **No. 1910**, for either girl or boy.

No. 1910 comes in sizes 2, 4, 6, 8, 10 and 12 years and for the 8-year size, $2\frac{1}{2}$ yards 36-inch material is required. **Price 12c.** Embroidery **672** is 12c extra.

1800

Every home-maker welcomes a new apron! Made of gingham, gay chintz or unbleached muslin, ribbon trimmed, **No. 1800** is very attractive and so easily made! An hour or less serves to cut it, hem it, bind it and sew the pocket on.

No. 1800 cuts in sizes 36, 38, 40, 42, 44, 46, and 48 inches bust measure. Size 36 requires $3\frac{1}{4}$ yards of 32 or 36-inch material. **Pattern 12c.**

1890

Emb 674

1372

No. 1372 is an adorable creeping apron for the child 6 months, 1 year or 18 months. The one year size takes 1 yard, with $3\frac{1}{4}$ yards binding. **Pattern 12c.**

1910

Emb 672

The popularity of the overblouse was never greater. **No. 1932** shows the prettiest style, with long sleeves or short, and with the new slit-effect in the long-sleeved model. The diagram shows how easy it is to make. Plain or printed silk crêpe, broché silk or a plain or figured cotton will give good service.

No. 1932 cuts in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes $2\frac{1}{4}$ yards of 40-inch material, 3 yards binding. **Price 12c.**

1932

Embroidery Patterns

EACH one of our embroidery patterns may be used over and over again. Full directions and both white and blue wax are furnished with each pattern so that designs can be used on any material.

No. 660 includes one 4-inch border, one two-inch border of Egyptian design and eight separate motifs to use on dresses, household linens or bags as shown in illustration.

No. 658 furnishes an entire alphabet, including Mc in Chinese lettering and in addition three motifs for towels, scarfs and other household linens, and four designs to be used on children's clothes.

No. 650 includes dainty butterfly sprays, one of which is illustrated applied to a nightgown. In addition there are 2 rabbit motifs 3 inches wide and $2\frac{3}{4}$ inches high and 2 other motifs 2 inches wide and $4\frac{1}{8}$ inches high and a two-inch border. These designs can be used on children's clothes, household linens, dresses, lingerie, bags, etc.

No. 662—The spray shown applied to this dainty undergarment is included in embroidery pattern, **No. 662** and in addition there are twenty-one other designs for lingerie, household linens, etc.

No. 674 includes a variety of motifs for appliqué and embroidery. Designs measure from $\frac{3}{4}$ inch high to 4 inches high.

No. 667. Five floral sprays and attractive motifs for appliqué or embroidery that are suitable for trimming dresses, hats, bags, children's clothes, household linens, etc. are included in this pattern. As shown, the design was applied to a bureau scarf.

Embroidery Patterns

No. 673. Two lattice borders, one $3\frac{3}{4}$ inches wide, the other $2\frac{1}{2}$ inches wide, a $\frac{5}{8}$ inch border for blanket stitching and four separate motifs of corresponding design are included in this pattern. One of the borders is shown applied to a table scarf; the designs might also be used on household linens, dresses, hats, neck scarfs, bags, etc.

No. 674. A few more of the designs that are included in this pattern which has been previously described are shown applied to doilies. **No. 674** is also shown applied to handkerchiefs.

No. 657 includes one large rose motif $8\frac{3}{4}$ inches long, two matching motifs for corner trimmings, a border $2\frac{1}{4}$ inches wide, a half-inch border for blanket stitching and eleven small designs, suitable for dresses, children's clothes, household linens, bags, hats and scarfs as shown in illustration.

No. 1811 One-Piece Blouse, that cuts in sizes 36, 38, 40, and 42 inches bust measure and requires for the 36-inch size, $1\frac{1}{4}$ yards of 36-inch material. As shown embroidery design **No. 666** adds considerably to its attractiveness.

No. 1429. Children's apron. Any child would be delighted with an apron like this. In sizes 8, 12, 16 years. Embroidery pattern **No. 653** supplies the decorative note. Many other designs besides the duck and appliqué pockets are included in this embroidery pattern.

To Order: Write name, address, pattern numbers and sizes very clearly; enclose correct amount in stamps or coin (wrap coin carefully) and send to Pattern Department American Agriculturist, 461 Fourth Avenue, New York City.

The Broad Highway

(Continued from page 383)

staff, "if your back 's broke, my chap—why, don't go for to blame me, that's all!"

"I 'm thinkin' Black Jarge would find this chap a bit different to Job," remarked the Ancient. "What do 'ee think, Simon?"

"Looks as if 'e might take a good blow, ah! and give one, for that matter," returned the Innkeeper, studying me. "He be pretty wide in the shoulders, and full in the chest, and, by the look of him, quick on 'is pins."

"You 've been a fightin' man, Simon, and you ought to know—but he 've got summat better still."

"And what might that be, Gaffer?" inquired the Innkeeper.

"A good, straight, bright eye, Simon, wi' a look in it as says, 'I will!'"

"Ah! but what o' Jarge?" cried Job. "Black Jarge don't mind a man's eyes, 'cept to black frequent."

"Job," said the Ancient, tapping his snuff-box, "theer 's some things as is better nor gert, big muscles, and gert, strong fists—if you was n't a danged fule you 'd know what I mean. Young man," he went on, turning to me, "you puts me in mind o' what I were at your age—but don't go for to be too cocksure for all that. Black Jarge are n't to be sneezed at."

"And, if you must 'it un," added the Innkeeper, "why, go for the chin—theer are n't a better place to 'it a man than on the chin, if so be you can thump it right."

"Thank you!" said I; "should it come to fighting, which Heaven forfend, I shall certainly remember your advice." Saying which, I turned away, and crossed the road to the open door of the smithy, very conscious of the three pairs of eyes that watched me as I went.

UPON the threshold of the forge I paused, and there, sure enough, was the smith. Indeed a fine, big fellow he was, with great shoulders, and a mighty chest, and arms whose bulging muscles showed to advantage in the red glow of the fire. In his left hand he grasped a pair of tongs, wherein was set a glowing iron scroll, upon which he beat with the hammer in his right. I stood watching until, having beaten out the glow from the iron, he plunged the scroll back into the fire, and fell to blowing with the bellows. But now, as I looked more closely at him, I almost doubted if this could be Black George, after all, for this man's hair was of a bright gold, and curled in tight rings upon his brow, while, instead of the black, scowling visage I had expected, I beheld a ruddy, open, well-featured face out of which looked a pair of eyes of a blue you may sometimes see in a summer sky at evening. It was with something of doubt in my mind, nevertheless, that I presently stepped into the smithy and accosted him.

"Are you Black George?" I inquired. At the sound of my voice, he let go the handle of the bellows, and turned; as I watched, I saw his brows draw suddenly together, while the golden hairs of his beard seemed to curl upward.

"Suppose I be?"

"Then I wish to speak with you."

"Be that what you 'm come for?"

"Yes."

"That 's a pity."

"Why?"

"'Cause you 'll 'ave a good way to go back again."

"What do you mean?"

"Well, for one thing, I means as I don't like your looks, my chap."

"And why don't you like my looks?"

"Lord!" exclaimed the smith, "'ow should I know—but I don't—of that I 'm sartin sure."

"Which reminds me," said I, "of a certain unpopular gentleman of the name of Fell, or Pell or Snell."

"Eh?" said the smith, staring.

"There is a verse, I remember, which runs, I think, in this wise:

'I do not love thee, Doctor Fell, or Pell, or Snell,
For reasons which I cannot tell;
But this I know, and know full well,
I do not love thee, Doctor Fell, or Pell, or Snell.'

"So you 'm a poet, eh?"

"No," said I, shaking my head.

"Then I 'm sorry for it; a man don't meet wi' poets every day," saying which,

he drew the scroll from the fire, and laid it, glowing, upon the anvil. "You was wishful to speak wi' me, I think?" he inquired.

"Yes," I answered.

"Ah!" nodded the smith, 'to be sure,' and, forthwith, began to sing most lustily marking the time very cleverly with his ponderous hand-hammer.

"If," I began, a little put out at this, "if you will listen to what I have to say—" But he only hammered away harder than ever, and roared his song the louder; and, though it sounded ill enough at the time, it was a song I came to know well later, the words of which are these:

Strike! ding! ding!
Strike! ding! ding!
The iron glows,
And loveth good blows
As fire doth bellows.
Strike! ding! ding!

Now seeing he was determined to give me no chance to speak, I presently seated myself close by, and fell to singing likewise. Oddly enough, the only thing I could recall, on the moment, was the Tinker's song, and that but very imperfectly; yet it served my purpose well enough. Thus we fell to it with a will, the different notes clashing, and filling the air with a most vile discord.

The louder he roared, the louder roared I, until the place fairly rang with the din, in so much that, chancing to look through the open doorway, I saw the Ancient, with Simon, Job, and several others, on the opposite side of the way, staring open-mouthed, as well they might. But still the smith and I continued to howl at each other with unabated vigor until he stopped, all at once, and threw down his hammer with a clang.

"Dang me if I like that voice o' yours!" he exclaimed.

"Why, to be sure, I don't sing very often," I answered.

"Which, I mean to say, is a very good thing; ah! a very good thing!"

"Then," said I, "suppose you listen to what I have to say?"

"Not by no manner o' means."

"Then what do you propose to do?"

"Why," said the smith, rising and stretching himself, "since you ax me, I 'm a-goin' to pitch you out o' yon door."

"You may try, of course," said I, measuring the distance between us with my eye, "but if you do, I shall certainly fetch you a knock with this staff of mine which I think you will remember for many a day."

SO saying, I rose and stepped out into the middle of the floor. Black George eyed me slowly up from the soles of my boots to the crown of my hat and down again and, seating himself on the anvil, folded his arms. All at once a merry twinkle leapt into the blue depths of his eyes, and I saw the swift gleam of a smile.

"What do 'ee want—man?" said he.

Now hereupon, with a sudden gesture, I pitched my staff out through the open doorway into the road, and folded my arms across my chest, even as he.

"Why did 'ee do that?" he inquired, staring.

"Because I don't think I shall need it, after all."

"But suppose I was to come for 'ee now?"

"But you won't."

"You be a strange sort o' chap!" said he, shaking his head.

"So they tell me."

"And what does the likes o' you want wi' the likes o' me?"

"Work!"

"Know anythin' about smithin'?"

"Not a thing."

"Then why come 'ere?"

"To learn."

"More fool you!" said the smith.

"Why?"

"Because smithin' is 'ard work, and dirty work, and work as is badly paid nowadays."

"Then why are you a smith?"

"My feyther was a smith afore me."

"And is that your only reason?"

"My only reason."

"Then you are the greater fool."

"Supposin'," said Black George,

Reviewing the Latest Eastern Markets and Prices

NO IMPROVEMENT IN APPLE MARKET

HERSCHEL H. JONES

INSTEAD of getting better as the end of the packing season approaches, the apple market shows no improvement except for small local sales. The New York market has been heavily supplied with western-boxed apples at low prices and prices on barreled apples were generally lower last week than a month previous. Some people in the trade, who follow the apple market closely, seem to think the prospect for a stronger market is not very encouraging because of the heavy storage holdings. The general feeling among dealers, however, is that December will see better prices on the varieties most in demand for the holidays.

The Federal report of cold storage of apples in the U. S. Nov. 1, 1923, shows 4,121,000 bbls. compared with 4,133,000 bbls. Nov. 1, 1922, and a five-year average of 3,099,000 bbls. The number of boxes was 5,358,000 compared with 4,164,000 on Nov. 1 1922 and a five-year average of 3,853,000 boxes. This means, of course, that either consumption will have to be considerably heavier or prices continue much lower than last year. The weather so far has not been favorable to increased consumption.

Carlot shipments of boxed apples totaled 37,573 cars up to Nov. 17 compared with 23,350 cars last year to date. Of barreled apples shipments there were 45,811 cars to that date compared with 48,376 last year. Exports of both barreled and boxed apples fell off last week. The export shipments of barreled apples were about half the previous week. The English markets have continued in a demoralized condition with very low prices.

New York State and Virginia Ben Davis sold at New York last week at \$2 to 3 per bbl. Baldwins, \$2 to 4; for average A Grade, 2½ inch, \$4.25 to 5. McIntosh, fancy, large, out of storage, from State and Hudson River sections, \$7 to 8 per bbl. Northern Spy State and River, \$2.25 to 5.

CABBAGE MARKET FIRMER

Cold weather, storing and a better demand sent the price on medium Danish cabbage up from \$13 per ton loading point to \$17. Shippers were not confirming except at top price.

POTATO MARKET DRAGS

Potatoes last week in the New York Market met a slow demand partly due to the mild weather. Long Islands were confirmed in carlots at \$3 per 150-pound sack loading point; \$1.10 to 1.20 per bushel in bulk.

Color Your Butter

"Dandelion Butter Color" Gives That Golden June Shade which Brings Top Prices

Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade. "Dandelion Butter Color" is purely vegetable, harmless, and meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Absolutely tasteless. Large bottles cost only 35 cents at drug or grocery stores. Wells & Richardson Co., Burlington, Vt.

HENRY W. SATTERTHWAITE - Woodbourne, Pa.

Natural Leaf Tobacco
Chewing, 5 lbs. \$1.75; 10 lbs. \$3.00; 20 lbs. \$5.25.
Smoking, 5 lbs. \$1.25; 10 lbs. \$2.50; 20 lbs. \$4.50. **FARMERS UNION, MATFIELD, KY.**

Maines sold for \$2.75 to 2.85 in 150-pound sacks; \$1.65 to 1.75 cwt in bulk delivered New York City.

States moved in carlots for \$2.40 to 2.50 in 150-pound sacks and \$1.50 to 1.60 cwt. in bulk.

In New York City at times dealers had difficulty in getting 10 cents a sack more than cost.

DAIRY MARKET UNCERTAIN

The past week marked an important change in the markets on butter, eggs and cheese. Butter suffered a pronounced decline after the high prices of the previous week, while eggs and cheese developed an uncertainty that seemed to point in the same direction. In no case did buyers show the confidence of the previous week, and the movement of goods was of a hand-to-

the market was inactive. Live lambs declined but met a stiffer market at the close because of very light receipts.

CASH GRAIN QUOTATIONS

The following were cash grain quotations on November 23:

NEW YORK: Wheat—No. 2 red, \$1.22¼. Corn—No. 2 yellow, \$1.03¼; No. 2 mixed, \$1.00¼; No. 2 white, \$1.03¼. Oats—No. 2 white, 53c; No. 3 white, 51 to 51½; ordinary white clipped, 54½ to 55½c. Rye—77½c. Barley—75 to 79c.

CHICAGO: Corn—No. 2 yellow, 90 to 98c; No. 3 white, 78½ to 81c; No. 3 yellow, 82½ to 83½c. Oats—No. 2 white, 43½ to 44½c; No. 3 white, 43½ to 44c. Rye—71 to 71½c. Barley—58 to 72c.

HONEY MARKET IRREGULAR

Demand for New York State and eastern honey has been active, but prices irregular. Carlots of white

Quotations From Eastern Markets

Sheep, common to good ewes.....	3 to 4¼
Hogs, Yorkers.....	7¼ to 7½

mouth character as if the buyers were waiting for developments.

Butter fell off from 2½ to 3 cents per pound. This was partly due to heavy arrivals of foreign butter just as weakness showed in the market. Reports from butter making sections showing a slight increase in the make indicated that the lowest period of production has been reached with the promise of increases hereafter. High prices likewise had some effect in curtailing consumption and reacting on the market.

The cheese market was very quiet with buyers showing little interest. Prices did not vary much from the previous week. Federal reports indicated a normal reduction of storage stocks.

HAY MARKET DULL

Heavier receipts of hay resulted in a dull market and lower prices which ranged from \$1 to \$2 lower than for the previous week. On November 22 No. 2 barely reached \$27 and No. 3 \$25. In spite of lower prices, hay continued to move in large quantities.

TURKEY SHIPMENTS HEAVY

Turkeys began to arrive in large numbers on November 22 and 23, when six carloads were reported. They met a rather easy market at 40 cents on freight and 40 to 45 cents on express shipments. The demand was chiefly for hens, which if small commanded a premium.

Other live poultry in spite of very heavy receipts held firm. Freight arrivals for the past week amounted to 285 carloads.

CALVES AND LAMBS

The market on live calves met a sharp decline under heavy receipts. Toward the end of the week prices improved somewhat under a better demand, choice nearby veal selling at \$13 per cwt. On country-dressed calves

clover sold at 9 to 10½ cents per pound; light amber 8 to 10 cents. Ton lots, white clover 9½ to 12 cents; amber 9 cents. Single cans, white, 13 to 15 cents; amber 10 cents.

New York City quotations for white clover wholesale 12 to 12½ cents; buckwheat 10 to 10½ cents per pound.

CORRECTING A SLOPPY PISTON

Is there any way to tighten a sloppy piston without reboring? I have seen innerings advertised and wonder if they proved satisfactory.—J. H., New York

I do not know of any good way to correct a sloppy piston without reboring. The use of innerings will not correct the condition. Until you are able to put up your engine for overhauling, you may find temporary relief from your troubles by using a heavy oil.—F. G. B.

The Year's Work

(Continued from page 375)

judgment of the State Department of Farms and Markets, necessary for an extension of this service to other shipping points and to other products where there now is an active demand for this service.

FOR REFORESTATION

RESOLVED, that the New York State Farm Bureau Federation appoint a committee that will represent the Federation, the Conservation Commission, the State College of Agriculture and other interested agencies that will make a study of practical ways of using unprofitable land for reforestation for the purpose of recommending constructive legislation.

TO DEEPEN HUDSON

WHEREAS, Col. Slattery, the United States Army District Engineer, is now considering the presentation to the Board of Army Engineers the estimate of deepening the Hudson River to 27 feet from city of Hudson to Federal dam at Troy and has requested information as regards the value to the State and Government of this improvement, and

WHEREAS, it would be of great benefit not only to the business of the State and Nation but to agriculture throughout the entire country,

Be It Resolved, that the New York State Farm Bureau Federation assembled in annual

session at Syracuse go on record in favor of this project and recommend favorable action by United States Board of Army Engineers.

BETTER RATES FOR SMALL SHIPPER

WHEREAS, the Interstate Commerce Commission has recently made a ruling on rates on livestock in mixed car lots, whereby the shipper is forced to pay freight on the entire car at a rate based on the stock in that car that carries the highest rates. This is very unjust to New York farmers and small shippers, as there is seldom enough of one kind of stock in a community ready to ship at one time to make a straight car.

Therefore Be It Resolved, that this New York State Farm Bureau Federation go on record as opposed to this rate ruling, and instruct their Traffic Department to take immediate steps to secure relief.

Opening the Door to Many Markets

(Continued from page 378)

occupied at all times, and the resulting economies in overhead management, as well as the hundred and one other advantages of large scale operation, are vital economies in reducing marketing costs.

The method of financing is simple. Running expenses for the distribution and sale of members' products are paid out of retails made from the selling price of each car. Continuous financing is secured by the establishment of a working fund, which is built up from a nominal flat "retain" on each car that passes through the Federated service. This latter phase of the financing is called the revolving fund. In the course of a few years it will return to members all of the money which they have advanced as a loan to the organization.

In a word, the executive and sales direction of the Federated Growers provides to members a national sales service, the only one of its kind in the United States for the sale of perishable fruits and vegetables. In addition, the Federated maintains a Department of Field Organization for specific service to embryo associations or prospective members, and a Department of Information which is maintained for the use of member associations and for general informational contact with the public. There are also well organized traffic and claim departments which take care of the transportation and claim troubles of Federated members at cost.

That the move is successful is indicated by the current season's sale of cooperatively marketed products to an extent of 40,000 cars.

The problem before this great national organization, now representing 25,000 organized growers, has advanced to one of extension and selection, and further organization in producing districts for more carefully standardized and graded products.

The Broad Highway

(Continued from page 385)

stroking his golden beard reflectively. "supposin' I was to get up and break your neck for that."

"Then you would, at least, save me from the folly of becoming a smith."

"My chap," he growled, holding up a warning hand, "go easy now, go easy; don't get me took again."

"Not if I can help it," I returned.

"I be a quiet soul till I gets took—a very quiet soul—lambs bean't quieter, but I won't answer for that neck o' yours if I do get took—so look out!"

"I understand you have an important piece of work on hand," said I, changing the subject.

"Th' owd church screen, yes."

"And are in need of a helper?"

"Ah! to be sure—but you are n't got the look o' a workin' cove. I never see a workin' cove wi' 'ands the like o' yours, so white as a woman's they be."

"I have worked hard enough in my time, nevertheless," said I.

"What might you 'ave done, now?"

"I have translated Petronius Arbiter, also Quintilian, with a literal rendering into the English of the Memoires of the Sieur de Brantôme."

"Oh," exclaimed the smith, "that sounds a lot! anything more?"

"Yes," I answered; "I won the High Jump, and Throwing the Hammer."

"Throwin' th' 'ammer!" repeated Black George musingly; "was it anything like that theer?" And he pointed to a sledge near by.

"Something," I answered.

"And you want work?"

"I do."

"Tell 'ee what, my fellow, if you can throw that theer 'ammer further nor me, then I 'll say, 'Done,' and you can name your own wages, but if I beat you, then you must stand up to me for ten minutes, and I 'll give 'ee a good trouncin' to ease my mind—what d' ye say?"

After a momentary hesitation, I nodded my head.

"Done!" said I.

"More fool you!" grinned the smith, and, catching up his sledge-hammer, he strode out into the road.

BEFORE "The Bull" a small crowd had gathered, all newly come from field or farmyard, having doubtless been drawn thither by the outcry of Black George and myself. Now I noticed that while they listened to the Ancient, who was holding forth, snuff-box in hand, yet every eye was turned towards the smithy. At our appearance, however, I thought they seemed, one and all, vastly surprised.

"Well, I 'll be danged!" exclaimed Job.

"I knowed it! I knowed it!" cried the Ancient, rubbing his hands and chuckling.

"Knowed what, Gaffer?" inquired Black George, as we came up.

"Why, I knowed as this young chap would come out a-walkin' 'pon his own two legs, and not like Job, a-rollin' and a wallerin' in the dust o' th' road—like a hog."

"Why, y' see, Gaffer," began the smith, almost apologetically it seemed to me, "it do come sort o' nat'ral heave the likes o' Job about a bit—Job's made for it, I might say, but this chap's different."

"So 'e be, Jarge—so 'e be!" nodded the Ancient.

"Though, mark me, Gaffer, I are n't nohow in love wi' this chap neither—'e gabs too much, to suit me, by a long sight!"

"'E do that!" chimed in Job, edging nearer; "what I sez is, if 'e do get 'is back broke, 'e are n't got nobody to blame but 'isself—so cocksure as 'e be."

"Job," said the Ancient, "hold thee tongue."

In this conversation I bore no part, busying myself in drawing out a wide circle in the dust, a proceeding watched by the others with much interest, and not a few wondering comments.

"What be goin' to du wi' 'ammer, Jarge?" inquired the Ancient.

"Why," explained the smith, "this chap thinks 'e can throw it further nor me." At this there was a general laugh. "If so be 'e can," pursued Black George, "then 'e comes to work for me at 'is own price, but if I beat 'im, then 'e must stand up to me wi' 'is fists for ten minutes."

(To be continued)

Beautiful Betty Louise

QUEEN OF ALL THE DOLLS

TWO FEET TALL

Yours

As a Gift For Only 4 Yearly Subscriptions, New or Renewal

Reward No. 60-D-1—Betty Louise is just the loveliest doll you ever saw. Her pretty face is made of a fine quality bisque. She is not a stuffed doll, but a big live-looking beauty that will make her the royal favorite of every little girl who receives her.

Betty Louise is quite modest and dislikes to talk, but if she could talk this is what she would say about herself:

"I am about 2 feet high and have bright eyes that open and close. I have a well-made, all jointed composition body, arms and legs. If you want me to sit down, all you have to do is fix me for that position.

"I have three joints in each of my arms, the first one being at my shoulder, the second at my elbow, and the third at my wrist. My hands, dear little girls, are almost like your own. I have four fingers and a thumb on each hand, and the top of each finger is painted to give it the appearance of a finger nail.

"Long, dark brown, silky eyelashes are shown above my big brown eyes that open and close, and I have pretty hand-painted brown eyebrows. Because I am always smiling, you can see three of my pretty white teeth—another thing which most dolls do not have.

"Because I love to have little girls or their mothers fuss around and make clothes to suit me, I come dressed in only a fine quality cambric chemise, and wear a pair of pretty white

canvass slippers with white socks to match. Please make me your companion. I promise to make you happy."

Our Wonderful Gift Offer

For only 4 yearly subscriptions for American Agriculturist at \$1.00 each, we will send you Betty Louise, free, postpaid.

NOTE: If you wish to make clothes for Betty Louise, we will send you a Doll's Pattern Set, which consists of a one-piece slip-on dress, a cape, a tam-o'-shanter hat, envelope chemise and petticoat pattern for only 20 cents extra. Ask for Doll's Pattern Set No. 9821 in size 24 inches.

How They Make Money in Their Own Homes

One Woman Earned \$1150.00 in Eleven Months—in Spare Time Only—Thousands are Turning Odd Moments Into Dollars

HAVEN'T you often wished for some practical way of making money right in your own home? Of course—and you have felt sure that there must be some steady home occupation that would bring you, not just "pin money," but many extra dollars in return for your spare hours. There is—and it is called "Auto Knitting."

Let us tell you how you can make your wish to earn money in odd moments come true—without interfering with your household duties or regular daily work. But first listen to the remarkable story of Mrs. Frank Unger—one of the home women who has been most successful at Auto Knitting.

Mrs. Unger's Own Story

"Our expenses were steadily increasing," writes Mrs. Unger. "My husband's wages were hardly enough to meet the household accounts, to say nothing of clothing. And so things ran along for months, with us pinching and skimping and trying desperately to break even."

"I began wondering what I could do to help. To go out and work was impossible, because I had a four-months-old baby to care for. There was just one thing for me: I must find some sort of home work that would pay good wages."

"I began looking in the magazines and newspapers for some sort of paying home work, but no one seemed to have any work to offer me."

"Then one day I opened the paper to look for work as usual. And on one of the pages this headline caught my eye: 'How I Make Money Right at Home.' Of course, I started to read, and soon I was real excited. It was about a woman whose husband got a small salary—hardly enough for them to live on, with everything so expensive. She wanted to make extra money just as badly as I did. But she had two little children, so she couldn't do any paying work unless she could find something to do at home. It was my situation exactly."

"Then it went on to tell how at last she did find home work—making socks on a hand-knitting machine, and how the company paid her for making them, and furnished replacement yarn for each lot of standard socks she sent in. The name of the firm was the Auto Knitter Hosiery Company, and they were

located at Buffalo, N. Y. So I wrote a letter to the company, asking for their free information. In just a few days I had a reply telling me all about the machine and the details of their homework proposition. And then I was more enthusiastic than ever and sent for an Auto Knitter."

How I Made Money

"In a short time my knitter arrived. At first I was a little bit afraid, because I didn't know anything about machines, but finally, with a little patience and the aid of the clearly written instruction book, completely mastered the operation of the Auto Knitter."

"Then I started to work in real earnest, putting in every minute I could spare from my housework. And all the while checks from the Auto Knitter Hosiery Company kept coming in for each lot of standard socks I sent them. I love my work more each week."

Made Over 7,000 Pairs

"I have knit over 7,000 pairs of men's socks. Several hundred pairs were sold to my friends."

"I have had my machine eleven months, and I have made in all \$1,150.00 out of the socks I have knit with it. With this money we have made the first payment on our home and plan to pay the rest in the same way. In addition, I have made my original investment for machine and yarn."

"And now we are realizing the dream of a lifetime—a little cottage of our own. Our Auto Knitter has helped to make it possible. To those who want to make extra money at home in their spare time I heartily recommend the Auto Knitter. There is nothing like it."

MRS. FRANK UNGER, New York.

How You, Too, Can Make Money at Home

Mrs. Unger has told you in her own words what she did with Auto Knitting. Since writing this letter her earnings have increased to \$2,583.50, and more. The money-making possibilities of the Auto Knitter are still hers. She increased her earnings regularly and surely in the same way she earned the first \$1,150.00. Mrs. Unger's experience, though it may be exceptional, shows what can be accomplished in this home occupation by persistence and industry. Her earnings may also be above the average, because, in addition to her natural quickness, she devotes a very considerable amount of time to the work.

But her story is interesting because it shows what the Auto Knitter will do in the hands of anyone who, through practice, becomes as skillful in its use as Mrs. Unger, and who can devote as much time to the occupation as she does.

Not every one can do this, of course, but women in all

parts of the country are finding in the Auto Knitter a means of making money in amounts which vary with their skill and the spare time they can give to running the machine. Men, too, are making money with the Auto Knitter in spare time.

Read on this page a few of the money-making experiences of actual people who have found in Auto Knitting the answer to their extra money problems. Why shouldn't you do as well as they have?

Clearly and briefly, here is our proposition: The Auto Knitter Hosiery Company enters into an agreement to buy all the standard socks you knit on the Auto Knitter and send in to them, paying a fixed guaranteed price. Checks will be sent promptly for each lot. Replacement yarn is also furnished for every shipment you send in. Previous experience in hand knitting is not necessary. Inexperienced persons can learn to turn out standard "Olde Tyme" wool socks with

the aid of the Auto Knitter. The machine comes to you with a sock already started in it, and with an Instruction Book that makes everything plain.

A wonderful new feature is the Double Value Plan that makes every wage dollar worth two—it's an exclusive Auto Knitter privilege that makes this occupation still more profitable.

Get Information FREE

Of course you want to know more about the wonderful little machine that helped Mrs. Frank Unger and all these other people to make their dreams come true. Send right away for the company's free literature and read the experiences of other Auto Knitter owners. Find out about the money-making opportunity offered you. Remember that Mrs. Unger lost no time in getting the facts. You are in her position today. Will you follow her example? Just write your name and address in the space below. Made \$308.64 in Spare Time

"It had been just one year since I sent my first shipment to the company, and during that time they have paid me in checks \$308.64. I only work a part of the time but I could hardly have seen my way out had it not been for my little Auto Knitter."

MRS. O. F. LADD
Arkansas (No. 12)

Has Made \$600.00 Knitting

"I have already sent to the company 118 shipments of socks and have received either a check or yarn for each and have always received my replacement yarn in good shape. I have received over \$600 and haven't run my knitter nearly all the time until the last month. I have received the best of treatment from the company and found they do all they promised and even more."

WALTER HUIE
Missouri (No. 11)

Earned \$472 With Her Auto Knitter

Mrs. A. L. Heggen is the wife of a Minnesota farmer. She does all of her own housework and cares for her two boys, aged two and four. "Yet with all this," she writes, "I have found time to make 1,824 pairs of socks, for which I have received \$472.25."

Operates Three Machines

"I bought my first Auto Knitter from you about two years ago and since then have had no other employment but that of knitting hose. The first year I knit and sent the company 1,128 pairs of men's hose with never a pair rejected. Friends saw the work and orders began to come in. Can't give all the figures but have made \$1,600 out of 800 pairs ladies' hose beside all other hose."

THEO. S. KELLOGG
Utah (No. 1)

Has Knit 20,000 Pairs

"All the work I have done has been pleasant and easy and withal amazingly simple. I have now knit 20,022 pairs of men's socks and women's and children's hosiery. The Auto Knitter Hosiery Co. will give you a square deal at all times and they are prompt in sending their checks, also replacement yarn."

MRS. W. E. STRAUB
Pennsylvania (No. 2)

The Marvelous Auto Knitter

The perfected machine that knits the OLDE TYME WOOL SOCKS quickly and easily, making 60 stitches or more with a single turn of the handle. "Better than a hundred hands" is truly a slogan that applies to the Auto Knitter. Find out how to use this machine to knit your hours into dollars! Mail the coupon.

Better Than a Hundred Hands

Double Dollars Earned This Way

New plan gives double value checks. Startling new idea makes Auto Knitting twice as profitable, spare hours worth twice as much. Mrs. Unger's earnings up to date under this new plan would have amounted to \$6,028.16. Send the coupon now—full details of this new plan will come by return mail.

The Back-to-the-Lander—By Jared Van Wagenen, Jr.

The Paying Farm Must Be Healthful

A Wednesday Evening Radio Talk Broadcast From WEAF

THE wise farmer gives considerable thought to certain aspects of health, but not to all; he realizes that if he is to reap a good harvest the seed he uses must be from well-selected and vigorous stock; that his soil if acid must be limed, and in any case kept well fed with fertilizer; that his stock must be chosen with care and kept in prime condition—if an animal falls sick, a veterinarian is usually called without delay, for a dead cow or horse cuts deeply into profits. However, farmers, like many other classes of people, pay too little attention to the health of the best stock that any farm ever contains—themselves and their families.

The farm, with its abundance of sunshine,

By Dr. MATTHIAS NICOLL, Jr.

*Commissioner, Department of Health
State of New York*

the same reason they should also be carried at least a foot above the ground. Tight concrete platforms extending from four to eight feet on all sides are essential for dug wells, since dirt and filth are sure to find their way through wooden covers. Furthermore, the old-fashioned rope and bucket method of drawing water may be the means of infecting the water; iron pipe and a pump are cheaper than sickness. Driven or drilled wells should have tight casings and should also extend at least a foot above the ground.

Troughs or drains should be provided to conduct the waste water away from the well.

Running water in the farm home is not only a great convenience, but a saver of time and energy. Furthermore, it induces habits of cleanliness, which in the eyes of the sanitarian is more important than godliness. It can be installed at small cost to

so safeguard the various steps in the production, transportation and distribution of milk that it will reach the consumer in a condition as nearly perfect as possible. Every intelligent farmer nowadays realizes that to do his share in supplying clean milk he must have healthy stock, clean barns, clean cows, clean utensils, and, of greatest importance, clean milkers with clean hands.

Many farmers seem to believe that clean milk can be produced only in new barns, expensively equipped. This is far from being the fact. A new barn is certainly easier to keep immaculate, but an old barn may be fixed over at slight expense so that it may be kept clean, but even if no changes are made, with proper care a high-grade milk can be produced in almost any barn.

Proper care includes a good many details. The flanks and tail of the cow should be dampened before milking, and the udder should be washed clean and wiped dry with a clean, dry towel. The milker must be personally clean, and should wear clean jumper and overalls, his hands must be washed with soap and water and thoroughly dried with a clean towel before milking. The milk-pails must be of the small-topped variety, and must be thoroughly washed and scalded after use, and then kept inverted until time for the next milking. Finally, after the milk is collected it must be cooled immediately—preferably to 45 degrees F.—and kept at that temperature until delivered to the consumer.

Any farmer can introduce clean methods and produce a good grade of milk with very little expense and without hardship. In fact, to-day many dairymen are demonstrating that it pays to do this, for most distributors and consumers are willing to give a higher price for a clean product.

Not only should the farmer give attention to the sanitation of his home and its immediate surroundings, but he should give the same degree of thought to the healthfulness of the school attended by his children. The little red schoolhouse is not always the most healthful environment for the child, chiefly because what is everybody's business is nobody's business. Although the fact that the common drinking-cup is dangerous has been established time after time, one still finds it in an occasional school. The same sanitary principles which rule the home should govern the conditions of the school. Look in once in a while and see what kind of surroundings your child

An ideal layout for farm buildings to protect the water supply. Note that the drainage from the barns and outbuildings is away from the house.

fresh air and fresh foods, should be the healthiest place on which to live, but that this is not always so is shown by the records of sickness and deaths, the rural death-rate being higher than that for the cities. In a great many cases this is due to neglect of those small details, correction of which is so easily put off until a more convenient time. If these matters have not already received attention, now is the time to consider them, for after all, the greatest asset is health, not only to the farmer but to everyone.

Many people believe that because water is clear and sparkling it must be wholesome, but unfortunately this is not true; even the clearest and best-tasting well-water may cause disease if the well is improperly located and subject to pollution from the privy or barnyard.

In choosing a location for a well, convenience should not be allowed to weigh against safety. If possible, the well should be located at a point higher than any sources of pollution, such as the privy, the manure-pile or the sink-drain. Generally speaking the flow of underground water is indicated by the surface slope of the land, and the well should be so located that the line of flow will be toward and not away from these places. In any case, locate it at least 100 feet from all sources of contamination. Sometimes this distance must be greater, depending upon the nature of the soil, and the number of people using the well and the privy. The soil filters out the impurities, and sand of uniform texture affords the best purification; coarse gravel and seamy rock, the least. A laboratory analysis will tell you if the water you are now drinking is polluted. Just because you have used a well for years doesn't necessarily mean that it is safe; you may have become accustomed to the water and thus be able to stand it, but that doesn't mean it won't make other people sick. On the other hand, some stranger may pollute the water and you and your family be made sick.

The construction of a well is also a matter of importance. The walls of dug wells should be made water-tight to a depth of at least eight feet below the surface of the ground, in order to prevent contamination by surface water. For

anyone possessing a reasonable amount of mechanical ability. A moving-picture film showing how this can be done will be loaned by the State Department of Health to any grange or farm bureau in New York State possessing a moving-picture machine.

A sanitary privy costs no more than an insanitary one, and it is a fairly easy matter to build one that can be kept clean and reasonably free from odor, and to locate it where it will not contaminate the well or be a source of infection. Further details can be obtained by writing to the United States Public Health Service at Washington, D. C., and asking for Public Health Bulletin No. 37.

The Good Book says that "no man liveth to himself alone," and this is particularly true of the farmer, even if he does live a fairly isolated life. If infectious disease develops in the family or among the help on the farm, it is almost certain to find its way to others by means of foodstuffs. Especially is this true of milk, for it is the most difficult food to produce and distribute with safety to the consumer, because disease germs live and multiply rapidly in it. A

few disease germs introduced into the milk at the farm may multiply to millions by the time it reaches the city, and thus cause everyone on the milk route to become infected. Farmers do not always realize so fully as medical men just how much damage unclean milk may do.

Health authorities determine the cleanliness of milk by the number of bacteria or germs found in a given amount. Bacteria have no business in milk, and when an excessive number is found it proves conclusively that there is something wrong in the method of milking, or in the subsequent care of the milk. The problem, then, is to

A condition and practice that is a serious menace to the health of the farm family.

lives in for more than half the day. Urge your neighbor to do likewise, and if conditions are not as they should be—see that the school authorities remedy the defects.

The AMERICAN AGRICULTURIST, in cooperation with the New York State Department of Farms and Markets, broadcasts a radio market report from WEAF, every Tuesday, Wednesday, Thursday and Friday at 11.50 A. M. These reports cover prices and trends in the New York produce markets. "Tune in" and keep posted on the condition of the market.

"Back-to-the-Landers" and Land Sharks

"Stop, Look, Listen" and Avoid Disillusion and Heartbreaks

IT is not often that I feel myself to be a "man with a message" constrained to stand and cry aloud as did old Jonah in the crowded streets of Nineveh. But observations extending over several years with the addition of some very recent and vivid experiences have made me wish that I might give an earnest word of counsel and warning to every city-bred man who, usually mistakenly and intent on burning his bridges behind him, is planning to go to the land.

Quite a good many years ago—even before the Great War—some misguided enthusiast made a catching phrase that became almost a slogan "Back to the Land." I think that in his thought and in the thought of many others it had the fine spirit of a new Crusade—a sort of solemn duty to the Nation and the hour. But the movement was economically unsound and if it had never been acted upon it would have saved much of disappointment and loss and disillusion and heartbreak. Every year from our cities there go to the farms a considerable number of enthusiastic idealists—people who really love or think they love country life and who see farming through a sort of golden mist of romance and every year there returns to the city again a pathetic procession of folks disillusionized in spirit and broken in fortune. Fortunate are they if they have lost nothing more than some money and two or three years of wasted efforts.

Last week I appraised six farms for the Federal Land Bank and two of them were occupied by "Back-to-the-Landers"—poor, helpless, ignorant babes in the woods who made a fearful, almost tragic mistake in leaving behind them connections which afforded them a secure place in the world and then (I speak strongly perhaps) in a moment of folly, faring gayly forth into a life of which they knew nothing and in which men succeed only by virtue of adaptability coupled with training, skill and experience.

These cases are only two of at least a dozen with which I have had intimate knowledge and contact. I propose to tell the simple and absolutely exact story of one of these. The other concerns a woman and I shall not spread her story before the world even under the full protection of concealing all details that would enable any one save her to recognize it.

The scene was laid in an eastern county of the Hill Country of New York. I have found that if you want to get exact, dependable directions for reaching a remote and hidden farm there is no one to consult equal to the rural mail carrier. So I dropped into the post office of a good sized

By JARED VAN WAGENEN, JR.

railroad village. It was early forenoon and several carriers were busy sorting and preparing their route mail. I asked for the carrier of Route 2 and a bright, keen-eyed young man responded. When I gave the name of the farm I sought he grinned cheerfully and replied with both a statement and a question in one breath. "Well you've got some climb. Have you got a Ford?" I confessed that while I didn't have a Ford I had a car that would go anywhere that rubber tires could find foothold. He picked up a scrap of paper and carefully

"The avenue became a broad state highway that changed into a country road, that merged into a by-lane, which became a cart track, leading into a cow-path, that finally was lost in a squirrel track which ran up a tree."

charted my course, mapping it in detail with all turns and crossings including the bridges I should cross. These running directions reminded me of the man who, being of an investigational turn of mind, decided to follow a great city avenue to the end. The avenue presently became a broad State highway that changed into a country road that merged into a by-lane which became a cart track leading into a cow path that finally was lost in a squirrel track which ran up a tree. Thus finally he came to the end of his quest. I had almost this experience. For a mile or two I bowled along over a faultless concrete road, then turned up a dirt road and through a decaying village and then I turned the machine straight up the long steep mountain road gullied and rutted in spite of the numerous "Thank-you-marms" built across it. Once or twice I stopped to view and admire the criss-cross billows of the Hill Country spread out beneath me. Once, puzzled to know if the turn to which I had come represented merely a wood road or the public highway, I went a quarter of a mile across the fields to inquire. A mile or two further on I came out upon the high rolling plateau—a sort of moor-land, only the word "moor"

does not yet seem to have found a common place in our American speech. All this locality is old agricultural land—part of the holdings of Kiliaen van Rensselaer, the Patroon, who in 1637 founded a far flung barony 48 miles long and half as wide comprising the larger part of the counties of Albany, Columbia and Rensselaer. Men have been living on these lands for very many years. There is plenty of material for romance in the tales of the anti-rent war which took place almost a century ago. Bygone generations of men labored faithfully and well on these ancient farms and out of the abundant stone that cumbered the

ground, piled up wonderful lines of massive stone walls. I hope that some day some one in worthy fashion will write the epic story of these walls. Today many of the old farm houses are tenantless and the unpainted barns are falling in and the untouched fields are covering their nakedness with a growth of goldenrod and hardhack and over it all brood the memories of a brave, hardy agricultural folk who here once lived out their lives in herculean labor and in obscurity and yet in hope and content. It was a raw, bleak October day with a high wind, an overcast gray sky and now and then a spitting snow flake and the whole gloomy landscape pressed down my spirit with a sense of the brevity and futility of human effort.

A little further on, true to the map of the rural mail carrier, I found the farm.

The house was fairly good—good enough to serve the needs of a better farm. Across the road were two ancient, weather beaten dilapidated barns and just below (it must be very beautiful under blue, midsummer skies) was a lake of forty acres fringed by woodland and abandoned fields, and in the front yard unloading "top-wood" from a wagon was the proprietor.

His story was very simple and quickly told. He was 53 years old. His home had been New York City. He was by profession a skilled carpenter with a very special field, being employed by one of the big greenhouse construction companies to erect the greenhouses which they sold and he was accustomed to being sent all over the eastern half of the country. Perhaps his folly is the more inexplicable because he had enjoyed very unusual opportunities for travel and observation. He had long been touched with the back-to-the-land fever and two years ago returning from a trip to Detroit he read in—God save the mark—he read in the New York Evening World the advertisement of this farm. So he stopped off to see it. He did not note the high hills or the poor mountain

VOL. 112 December 8, 1923 No. 23

The Truth in Advertising

"I WISH to express my hearty congratulations to the AMERICAN AGRICULTURIST on the courageous and bold stand you are taking in regard to frauds and fraud advertising, of which the Standard Food and Fur Association is a typical example. Such efforts must be successful, and because they are bound to be, I know you will receive the lasting gratitude of your subscribers, and the hearty approval of the reading public. Again my congratulations and best wishes." L. H. H., Onondaga County, New York.

WE have received many such letters showing that the AMERICAN AGRICULTURIST's determined stand to help clean up the frauds and fake advertising is appreciated. If you could read some of the heartrending letters that come to our Protective Service Bureau, piteously asking for aid, usually when it is too late to do any good, you would see the need of the publicity we are giving to those who promise much for nothing. There is not a community that has not from one to several people who have been fleeced out of some or all of their savings by the nefarious operations of swindlers. Still, in spite of all the warnings, every mail brings a new list of victims.

The front pages of the newspapers carried recently the story of the conviction in a Federal court of Dr. Frederick A. Cook, who was sentenced to the penitentiary for fourteen years and nine months, and fined \$12,000 for using the mails to defraud in oil promotions. Dr. Cook will be remembered as the great fakir who came back from the Arctic several years ago and announced that he had discovered the North Pole. He was received as a hero until Dr. Peary, the real discoverer of the Pole, returned and exposed him.

In sentencing Cook, the judge said in part: "Cook, this deal of yours is so damnably rotten that it seems to me your attorneys must have been forced to hold their handkerchiefs to their noses to have represented you. You have stolen this money from widows and orphans. Have you no decency at all? Are you not haunted at night by these pitiable figures? How can you sleep? You ought to be paraded as a practical warning in every State where you have sold stock."

We shall have more of these articles. Our Protective Service Bureau and our lawyers want

to work with you to help stop the flow of hundreds of thousands of dollars of hard-earned savings for schemes from which nothing is received in return. If you know of any such operations send us full details.

"I Am From Missouri"

A FEW days ago we heard someone ask, "Where is the nigger in the woodpile in that new Rural School Bill? I'm from Missouri," he continued. This last was spoken with a good deal of pride, but for the life of us, we never could see why it was so much better to come from Missouri than any other State!

According to some people, there must be some trick about that School Bill. If it cannot be seen on the surface, then it is a hidden nigger in the woodpile. According to their belief, the farmer members of that Committee of Twenty-one are scheming rascals, whose only purpose in spending their time and money on the Committee was to put something over on their fellow farmers. No matter if you read to these doubters the actual statement in the bill itself that there can be no consolidation in any rural school district except by the vote of the people themselves, they still would maintain that there is some trick about it.

No matter if you actually prove that rural school taxes in hundreds of districts, because of more State aid mostly paid by the cities, would be actually lower than they are under the present law, they still steadfastly refuse to believe the evidence. No matter if it is clearly shown that item after item in the new bill provides for more real local control of the schools than farmers now have, there will still be some who doubt. They still boast that they are "from Missouri."

And the attitude of these chronic doubters is the same toward all issues of life and toward their fellows. Sometimes when these people of little faith find that their suspicions were actually unjustified, we wonder if they are not really disappointed. Fortunately, they are comparatively few in number.

The Prohibition Vote

SOME months ago we set out to get some expression from our people on the problem which is so much in the public mind at the present time—that of prohibition. It is, of course, impossible by a straw vote to get anything but an indication of sentiment, but we have received thousands of letters from both those who believe in prohibition and from those who are against it, and these letters show how much and how deeply farm people are thinking about the wisdom of the Eighteenth Amendment. As far as space has permitted, we have printed letters giving the arguments for both sides. The letters are so good that we wish we could use more of them.

In order to give all who wished an opportunity to vote, we have kept the vote open over a long period of time. We have now decided to bring it to a close January 1st, and in one of our January issues we will publish complete and detailed results of this canvass together with some more of the good letters.

If you have not voted and wish yourself to be counted on either side, send in your vote. Ballots for Granges and other local organizations or individuals will be furnished free of charge upon application.

A Farm School at Columbia?

IN his annual report, just published, Dr. Nicholas Murray Butler, president of Columbia University, New York City, urged the addition of an agricultural college to the University. With a splendid State agricultural college at Cornell, with good agricultural teaching at Syracuse, with half a dozen State farm schools and many agricultural high schools, and with many similar institutions in other States, President Butler's sugges-

tion to establish a farm school in the heart of New York City will strike every farmer at first as ridiculous.

But let us see. This new agricultural college at Columbia would, according to Dr. Butler's ideas, not attempt to teach farmers how to produce more. There would be no crop raising or animal husbandry courses. On this point, Dr. Butler says: "American farmers can now raise enough food-stuff to feed the world." He would concentrate his teaching forces on the problems of marketing, transportation, farm taxation, government aid, and the everlasting question of how to keep the young folks on the farms.

We think the proposal is excellent, and that it would do much to help farmers. It might be criticized from the standpoint that one who works on the farmer's marketing and financial problems must also have a very intimate understanding of his production problems, and that this understanding could not be obtained by men who were so far away from the farms as New York City. This objection could be overcome if the proper men were put in charge of the work. We have said many times that too little thought has been given to the great economic problems of the farm, such as marketing, taxation, government aid, etc. In the long run, these kind of farm problems are also city problems. The markets are in the cities, and the greatest market in the world is New York City.

The bringing together by a college, such as Dr. Butler proposes, of the best experts and economists that can be found anywhere to devote their entire time to the farmers' economic troubles, the chief of which is marketing, ought to help solve some of those difficulties, to give city folks a better idea of what the farmer has to overcome, and to educate more young men in the correct principles and methods of farm marketing and finance.

An Experiment

YOU will note that this issue of AMERICAN AGRICULTURIST looks somewhat different than those you have been recently receiving. The different appearance is due to change in the style of type. We are constantly working and experimenting to get you the very best possible farm paper, not only the best in pictures, articles and advertisements, but also in general appearance.

The use of the type in this issue is one of our experiments. Some folks in the office do not care for it. Perhaps you will not. Anyway, if you do not like it, let us know and it will soon be changed. You can help us give you what you want in a farm paper by frequently telling us what you think is poor and what is good.

Eastman's Chestnuts

IF there is any class or trade that has suffered more from hard times than farmers, it is the publisher of local or country newspapers. The price of news print paper has multiplied itself many times during the last decade. Other manufacturing and equipment costs of the printer have done the same thing and the country publishers' labor problems are worse even than those of the farmer. On the other hand, the possible number of subscribers to country weeklies is limited and it has been practically impossible to raise the subscription price or the advertising rates very much. The result has been that hundreds of country newspapers have had to go out of business.

This is extremely unfortunate, for the local weekly fills a real need in every community that cannot be met by any other agency. I am sorry to see them go, and I sympathize very deeply with one of these country editors who sat one day in his office sadly figuring up his weekly losses.

Suddenly, he looked up to see a funeral procession going by his window. He took one horrified look at the hearse, and then, throwing up his hands in a gesture of despair, exclaimed:

"By gosh, there goes my subscriber!"

The Cooperative's "Hired Man"

Third of the Series of Articles on Problems That Cooperatives Face

By E. R. EASTMAN

FEW of us have ever stopped to realize how complicated this business of marketing is, and how many different kinds of business are involved. A cooperative marketing organization doing a large business needs expert salesmen and sales managers. It needs a man or men trained in the modern science of advertising; it needs some one with an expert knowledge of banking and accounting. If it uses the railroads, to any extent, and most of them do, an expert traffic man must be employed. Also, good legal talent is essential. All of these and other trades and professions touch the marketing business, in addition to those which come nearer the farmers such as grading, packing, processing, standardizing, and storing the product.

It is plain that experts must be hired for these jobs, and I think the chief qualification to be demanded is successful experience in the work which the employee is expected to do for the cooperative. In addition to these special qualifications, at least a part of the employees of a farmers' organization should be men who came originally from the farm, with a knowledge of farm conditions and sympathy with the many problems which the farmer is up against. It will, of course, be impossible to have all employees with this qualification, but there must be at least some—and certainly those who have direct relations between the cooperative and the farmers should have it. Also, no employee should enter any important position in a cooperative without having a general knowledge of the organization and what it is trying to do, and of the whole cooperative movement. With a corps of "hired men" who, in addition to their special training for their particular jobs, have a farm sympathy and viewpoint and a knowledge of the aims and ideals of cooperation, the organization will have an "esprit de corps"; that is, a spirit of loyalty and a determination to work together for success that will be difficult to beat.

I do not think that a reputation as a "big man" in the business world is much of a qualification for a farmer organization employee. There has been a good deal of nonsense about hiring "big men" for cooperative work with the result that there has been a tendency to go out and pay a big salary for some spectacular "big man," who, when he is set to work in a cooperative organization, proves himself to be mostly bluff. Such men are more apt to be interested in advertising themselves and in making a big demonstration. The really big men in the business world or anywhere else, are usually poor self advertisers. They are often little known, having been more interested in building up and quietly and conservatively directing a successful business than they have in getting a sensational reputation as a "big business man." This business of marketing by organization is new work. It must be built up slowly and gradually. Farmers are in no position to stand heavy losses caused by building too rapidly on poor foundations or by too spectacular methods.

What about salaries for the cooperative's "hired man"? This is a real problem for salaries add to overhead and keep returns to farmers down. They look mighty big, too, to the average farmer who sees very little cash in the course of the year. But we can lay this down as a general principle: that unless a farmers' organization is sound enough and well built enough to hire and adequately pay for good employees, it will surely fail.

If an advertising expert, an accountant, a lawyer, or any of the other many employees of a cooperative can get a better salary from some other business it is very plain that he is not going

to stay very long. There are a good many men working for the farmers' organizations in New York and elsewhere who are now earning less money than they could get elsewhere, and are staying for a time as a matter of principle. They cannot long continue to do this.

Furthermore, there is a very great uncertainty as to the future from an employee's standpoint in all cooperative work. They look back over the history of farmers' organizations and think of the long line of men both officers and employees who have faithfully served cooperative organizations, who were left stranded and oftentimes discredited by the wayside, and they see little for themselves to look forward to in cooperative work.

There is a modern tendency in business to make faithful and capable employees partners in the business, by making it possible in some way for

It is easy to see this in plain figures. Applied to the milk business, a plant which ships a hundred cans of milk a day has a fair volume. It takes about three men to handle this milk in the plant. At present, such labor costs about six dollars a day, or an item of eighteen dollars for labor in the plant to start with. This means a labor cost of eighteen cents a can, to say nothing of all the rest of the labor charges involved in marketing the product. If there were several plants under one management, there would be further wage or salary charges of managers and clerks.

Now suppose that for some reason this plant was deserted by some of its farmers, or some of the dairies were sold, or maybe a mistake was made in locating the plant in the first place so that the plant handled only fifty cans a day. Unless some of the men were discharged, the labor cost would be doubled immediately.

It is easier to hire men than to discharge them, and maybe at another time of the year the supply would come back again so that the men would have to be kept on the job in order to have them when they were needed.

The same principle applies to the marketing of apples in the cooperative packing houses and to the marketing of any other farm commodity.

It would seem that right here was the secret of the ultimate success or failure of farm organization; that is, the volume of business must be kept large enough to justify the amount of labor employed. To work this out, two responsibilities are involved: first, the responsibility of the average farmer to patronize his cooperative so as to keep the volume large; and second, the responsibility of the directors of the cooperative to keep the amount of labor low, in proportion to the volume of business handled.

Another important factor in connection with the cooperative's "hired men" is the relations between the

officers and the directors of the cooperative and the employees. In the first place, the directors must be held responsible by the farmers for the success of the work. But it seems to me that this does not mean that the farmer directors or officers should attempt to run the details of the business. That is what the expert employees are for. If any particular employee or department shows by frequent and detailed reports to the directors that it is not accomplishing results, the plain horse-sense of the directors can soon detect this, and the employee or department head can be changed. But it is not fair to hold the employee or the department head responsible for the details of his work if the directors constantly interfere in those details and carry them out contrary to the advice of the hired expert. It is as foolhardy for a farmer director to attempt to tell the trained accountant, or the legal counsel, or the advertising expert how to run the details of his department as it would be for those same trained employees to tell farmers how to feed a cow.

Some of the larger cooperatives have had a practice of holding frequent conferences of the more important employees and department heads. At these conferences detailed reports of the progress of the work of the departments are given, policies are discussed and sometimes recommendations are made to the directors. Such conferences help to make everyone feel that all are working for the same object and they do much toward bringing the different divisions of work together as a unit.

One of the most important places to practice cooperation in a farmers' organization is between employees and directors and officers. All must feel that the organization is something more than a business corporation, that a great new economic

Let Us Think About It

THERE has been much written in the last few years on farmers' cooperatives, but nothing has appeared like the full and frank discussions we are giving you in the recent issues of American Agriculturist. Cooperative marketing is here to stay, but like all new machines, it is very crude. The sooner farmers can get the sand out of the gears and perfect the machine, the sooner it will enable them to sell their products to better advantage.

This means that we must give careful and much thought to our organizations. Read these articles and think about them. Probably you will disagree with some of the statements. We do not care so long as they start you thinking constructively about how you can work better with other farmers to sell your products for more money. If you wish, write us your views in a short letter and help us to think; but don't bother to write fault-finding letters. Farmers tried that on their marketing problems for more than fifty years and it did no good.—The Editors.

them to share in the stock or the business. The so-called "California Plan" of cooperation which has no stock and no dividends has many good points and is rapidly gaining ground in America. It does make every farmer a partner in the business. But an organization built on this plan does not offer much to employees and they never can have any real part in the business. Perhaps this is right, but I maintain that if the best kind of "hired men" are to be kept in cooperative work, some kind of a plan must be devised to give them a permanent interest and something besides a salary to work for.

One of the hardest propositions in farm organizations is not to load up with too much help, and to keep the number of employees down in proportion to the volume of business. The only excuse any organization has for existence is to bring farmers more money for their products. It may not be able to do this in the first or second year. Farmers should not expect too much; but in the end, better financial returns must be the test of the cooperative. To get these returns, overhead expenses must be kept down. This is a particularly difficult problem because prices of farm products are so low to start with that they will not stand for much overhead. In almost any other business, except farming, the retail price of the product can be placed high enough to take care of all the overhead of a large marketing organization and still leave a profit.

One of the largest items of overhead expenses in any organization, cooperative or otherwise, is the pay of the employees. We have already seen that employees cannot be held on salaries much lower than other business pays. Therefore, to keep the overhead down there is but one answer, and that is to limit the amount of help.

Does a Cow Need a Rest?

Recent Experiences that Question the Usual Practice

By H. E. BABCOCK

IS it necessary to dry off a cow and rest her between milking periods? The average dairyman will tell you emphatically "Yes". He may be right, but recently I have been getting some experience which leads me to question somewhat the usual dairy practice of drying off milking cows for six weeks to three months.

The experience has come in handling cows on advanced registry test. The Guernsey Breeders Association recognizes two kinds of official records—those made by cows which milk for a year without regard to the length of time a calf is carried, and those made by cows which carry a calf 265 days during the period of the year's test. A cow in the latter class must practically produce a calf at the same time she makes her year's record, since cows carry their calves but 283 days on the average.

As pure-bred calves are one of our chief sources of income we have been testing as many cows as possible under this second class. This means that we have bred them within six weeks to three months after freshening.

One cow has completed her year's work under this system and another has practically completed hers. Both cows have milked continuously during the year, including the day they freshened. Both cows have made unusually large records: Elmroad's Lady Rilma finished with 19,015 pounds of milk for the year and Lady Mary of Sunnyside will break the world's record for senior three-year-old Guernseys by over 500 pounds.

The care which these cows have received has necessarily been the very best we could give them. And here, perhaps, is where we have gained a bit of valuable experience which I am passing on to AMERICAN AGRICULTURIST readers for what it is worth.

Cared for as they were, these two cows have not only produced a remarkable amount of milk but have both dropped strong, robust calves and after freshening have picked up on milk production to practically the same amount which they made when they freshened after several weeks rest.

Does not this experience prove that care as much as rest is vital to the dairy cow at the time she freshens? I am convinced of one thing, at least: I would much rather have a cow milked right up to the time she freshens and given the best of care than to have her dry for two months or six weeks, during which time she is half starved, half watered and, generally abused. And this is the lot of the average dry cow in the average dairy herd.

Just how a cow that is well cared for will produce up to freshening and at the time of freshening may be interesting. Our official records show that Elmroad Lady Rilma milked 36.9 lbs. on September 1, fifteen days before freshening; on September 12, three days before freshening, 17 lbs.; on September 15, the day she freshened, 20.7 lbs. besides what her calf took.

Lady Mary, three days before freshening, milked 13.9 lbs.; the day she freshened, 14.2 lbs. besides what her calf took; three days later, 33.1 lbs. Within a week after freshening both cows had passed 40 lbs. and were steadily gaining, and they have every appearance of being able to go on and produce well for another lactation period.

This experience may be exceptional. Others may have had opposite results. In fact we were warned against making a year record with cows and having them freshen within the same year. From our limited experience with these two cows, however, there seems to be nothing to be alarmed about. Later I will tell something of how these cows have been cared for.

EDITOR'S NOTE—What about it? What is your experience?

"Back-to-the-Landers" and Land Sharks

(Continued from page 387)

road. He did not see with appraising eye the weather-beaten, abandoned farmsteads nor the rocky outcrop through the thin and slaty soil. He saw only the far reaching billowy landscape and most of all he confessed he saw the little lake so near his door flashing and sparkling in the sunshine. They offered him the farm of 145 acres together with a few broken down and worn-out implements, an old wagon or two and four or five decrepit "hand-box" cows for \$2,800. It seemed too good to be true. He promptly paid down \$1,400, practically all his savings and also gave a mortgage for \$1,400 on which he promised to pay \$200 each year. Since then he has managed to make one payment of \$200, and has

also made a few repairs to the house and has bought two or three more poor cows giving in payment his note for \$125. At last he is disillusioned and at the end of his rope. His only hope now is to save some part of what he has paid and as a drowning man clutches at a straw, so in his distress he turns to the Land Bank for aid and it cannot help him.

I am sorry for him—sorry beyond measure. He is an honest gentleman—straightforward, intelligent and absolutely free from bluff, but his experience is for him well nigh a tragedy. Of course he is a carpenter still and has his tools but he must begin once more at the bottom and in industrial life it is not so easy to establish new connections when you are past the half century mark.

I could set down other true stories of the land shark and his victim—the "back-to-the-lander." There are a number of real estate agencies operating here in the East and the most notable of them all has hundreds or for all I know thousands of agencies. Some of these agencies do a legitimate business and are run by reputable men but many of these men are past masters in the art of selling farms and their one business is to make a sale. Beyond that they have no responsibility and no conscience. In the main they prey on the ignorant foreigner and on the scarcely less helpless native. Once in Binghamton a chauffeur told me how he had been employed to drive a salesman and his prospect out to view a farm. He had previously been assured that this was planned for a quick run and that he was not expected to sleep at the wheel. As they climbed into the car, the agent remarked pleasantly: "Please note that the farm I am going to show you is only about half an hour from the heart of the city." Later on as the powerful car with wide open throttle bounded and swerved and tore up the rough hill road, the salesman leaned forward from the rear seat and hissed into the driver's ear: "Shoot her along—shoot her along."

There are agents whose creed of salesmanship is this. Make a sale any way and get just as large a cash payment as can possibly be extracted. Then write a contract to pay the remainder in fixed sums so large and at intervals so frequent that there shall be no possibility of fulfillment. Very recently I read an agreement where the purchaser had agreed to pay \$50.00 on the tenth day of each month. So far as the income from this farm is concerned he might just as well have agreed to pay the interest on the National Debt as it came due.

Fairness leads me to add that in this particular case the seller had been merciful and made no effort to literally enforce the terms.

Last week I read a contract which a buyer had signed and the final clause was this (I quote it exactly): "And it is further provided that in case any payment of principal or interest shall remain due and unpaid the party of the second part shall be deemed a tenant who has stayed beyond his term and the party of the first part shall be entitled to enter upon said premises and possess them in accordance with the law of the relations between landlord and tenant."

The other day I talked with a professor in our College of Agriculture—a man ordinarily of reserved and kindly and gentle speech—who said with fervor, directness and sincerity that he hoped—he hoped—that in that place of lost souls of which the preachers speak, there might be some little corner kept especially hot and reserved for the perpetual accommodation of those land sharks who prey on the confidence and ignorance and gullibility of the helpless souls who fall into their clutches.

I am very fond of advising country-bred people to remain in the country where they were born but I am exceedingly loath to advise city bred folks of slender means to seek any hazard of new fortunes on the land. If a man has some money beyond what he really needs and feels that he wants to amuse himself by playing at gentleman farming—why, that is another matter. I feel that ordinarily he is rather foolish but after all if he burns his fingers a bit no one really suffers. But when I find the city bred man with savings of a thousand or two dollars dead anxious to burn his bridges behind him and become a farmer I want to beg him to do as we are exhorted by the signs at some railroad crossings—"Stop, look, listen." If he asks my advice I usually give him the same frank, brief counsel that Josh Billings gave concerning matrimony—"DON'T."

I am a subscriber since about 1863 and have gotten it ever since. Have paid up to 1925. Would not be without. Every farmer should be a subscriber.—Z. WEBERBACH, Coopersburg, Pa.

HARDER SILOS

Are Easier To Buy

You can now buy a genuine Harder Silo on the most liberal terms ever offered to silo purchasers. You can meet the payments out of your milk checks and soon own clear and free the best silo that money can buy.

The new patented Harder-Victor Front is the most important silo improvement of recent years.

Write today for particulars and our free book, "Saving with Silos." Tell us how many cows you are milking and we'll also send a valuable Handy Pocket Record Book, especially arranged for farm accounts.

HARDER MFG. CORP.

EASY NOW TO SAW LOGS AND FELL TREES

WITTE Log-Saw Does the Work of 10 Men at 1, 20 the Cost—Saws 40 Cords a Day

A log-saw that will burn any fuel and deliver the surplus power so necessary to fast sawing is sure to show every owner an extra profit of over \$1,000.00 a year.

Such an outfit is the Witte Log-Saw which has met such sensational success. The WICO Magneto equipped Witte is known as the standard of power saws—fast cutting, with a natural "arm-swing" and free from the usual log-saw troubles. It burns kerosene, gasoline or distillate so economically that a full day's work costs only twenty-two cents.

WICO Magneto Equipped

Wm. Middlestadt reports that the Witte has replaced forty men using buck-saws. Hundreds of users saw as much as forty cords a day.

Mr. Witte says that the average user of a Witte Log and Tree Saw can make easily \$50.00 a day with the outfit and so confident is he that he offers to send the complete combination log and tree saw on ninety days' free trial to anyone who will write to him. The prices are lowest in history and under the method of easy payments spread over a year only a few dollars down puts the Witte to work for you.

If you are interested in making more money sawing wood and clearing your place at small cost, write Mr. Witte today at the Witte Engine Works, 6802 Witte Bldg., Kansas City, Mo., or 6802 Empire Bldg., Pittsburgh, Pa., for full details of this remarkable offer. You are under no obligation by writing.

"The Truth About Wire Fence"

SOLUTION OF THE MYSTERY THAT HAS COST FARMERS MILLIONS OF DOLLARS A cedar post outlasts a pine, so two rolls of wire fence may look alike, and cost the same, yet one will last twice as long as the other. Our circular solves the puzzle and shows you how to save that 100 per cent. You can know what you are buying just as surely as you can tell Oak from Poplar.

Write for a copy today. BOND STEEL POST CO., 28 East Maumee St., ADRIAN, MICH.

Winter Care of Orchards

If Trees Are Worth Setting. Protect Them

IT is poor business to buy pure bred young stock only to let them starve and become diseased; but the eastern states are mottled with young orchards that seem to have been properly set, of reasonably well chosen varieties, but that at present writing are the exact opposite of a "demonstration orchard." They are models of demonstration of how not to do it! Rodents, mice, and rabbits have taken terrible toll. Surface water in winter, settling about the trunks has frozen against the young bark fatally.

Sun-scald—the clear February sun in the still air after a zero night has ruined apple trees even up to several inches in diameter, especially the more thrifty. And finally, the borers we have always with us.

Once well-set, a fruit tree which perhaps originally cost but 30c is instantly worth \$1.00, and after one or two growing seasons is as well worth \$2.00 as any cow is worth a hundred. Now thrifty farmers never neglect one hundred dollar cows, but they do sorely neglect a one hundred dollar acre of young orchard trees.

Let us suppose, for instance, that they have yielded to the blandishments of some sales agent and bought expensive woven wire guards. A reliable supply house quotes these by the hundred as follows:

4x15—\$8.70

6x18—15.60 F. O. B.

So far so good, but after this heavy outlay, plus the expense of setting the guards properly about the tree trunk, we have protection from only one of the above mentioned dangers, the rodents. And if we have to lay out another ten to twenty dollars per hundred to protect against surface water, sun-scald and borers, we may as well give up right now.

As to rodents, a few days ago I saw a block of about fifty thirty-year-old Greening trees dead or dying from mice girdling, from a single winter's neglect. If we breed mice (and also rubbish) the size of the tree is never too large for their teeth, and this is equally true in regard to rabbits and deer.

To be sure a bearing apple tree worth \$25.00 is richly entitled to a wire guard, but we have never found them necessary. In some thirty years we have lost but two bearing trees from mice attacks, and in neither case did we breed the mice. These trees stood on the edges, and we were raided.

Inexpensive and Safe

Our methods with small trees are as follows: During early November workmen using long-handled spades pile several square cut spades full of soil against each tree (first having removed, with a sharp hoe, every atom of rubbish lying within two or three feet of the trunk). The result is a conical mound about one foot high which storms and wind settle somewhat, but still adequate to keep away burrowing mice, besides bracing the young tree against winter gales following a sudden thaw.

The mound also is a 100% insurance against the squeezing of surface water also, and is even a deterrent to the borers the following spring as we are in no hurry to level it down.

Supplementary to the above, choosing some mild day about the last of January we "paint" the tree from the lower crotches down into the ground with a sludge in which whale oil soap or crude carbolic acid are so manifest as to disgust every rabbit in that region. The body of the paint being whitewash, the winter injury from sun-scald is also thus avoided. A white

By DAVID STONE KELSEY

tree trunk will not draw the sun's rays.

Given a wash of the right consistency, one thrust of a heavily loaded paint brush in the crotch will thoroughly "paint" a small tree in thirty seconds. Sometimes we add a bit of dissolved resin to this mixture and apply it warm if much troubled by washing off from costal winter rains, and occasionally, a second application about mid-February is necessary. We mean to have "the flavor last" so that the carbolic will ward off both spring borers and June rabbits.

BRIDGE GRAFTING SAVES GIRDLED TREES

IN Bridge grafting to save girdled or damaged fruit trees as in all other grafting the cion wood should be one year old, well matured, and free from winter injury. There are various methods of inserting the cions in making the bridge. The essential point, however, say Experiment Station horticulturists, is that the cambium, or growing layer, of cion be in contact with the cambium of the tree above and below the girdle.

Grafting is best done in the spring when the bark begins to slip. A satisfactory method in bridge grafting is to remove a rectangle of bark above and below the girdle on the tree down to the cambium and of the same width as the cion. The ends of the cion are cut so as to bring the cambium of cion and tree in contact, when the ends are neatly fitted into the incisions of the tree.

A small wire nail driven through each end of the cion into the tree will hold the cion in place.

All the wound should be waxed over thoroughly. After the bridging is completed it is a good plan to mound the tree with soil above the girdle to prevent drying and checking.

While bridge grafting may save the tree, it is always better to prevent injuries which make it necessary.

ALFALFA IN THE ORCHARD

Some time ago AMERICAN AGRICULTURIST brought up the question of alfalfa in the apple orchard. Some excellent response was received relative to the experience of prominent growers. The following comes from the department of experimental pomology of the Pennsylvania State College of Agriculture. It bears out the experience of other growers, that alfalfa is a decided benefit in the orchard where it is cut and allowed to remain as a mulch.

IN 1908, Dr. J. P. Stewart, then in charge of the pomological research, planted about 750 apple trees in several experiments in the college orchard. One block of a dozen trees was seeded to alfalfa the following year. In order to get a good stand it was necessary to reseed the following year. Seven years later the block was again reseeded and again in 1921. The alfalfa has made a fair growth and has been clipped twice a year. While the trees were small the hay was piled around them but of late years it is left where it falls.

These 15 year old trees have never had nitrogen applied to them yet they have made as good growth as trees which have been under annual cultivation with heavy applications of fertilizers. Trees planted at the same time and grown under a timothy and blue-grass sod suffered to such an extent from nitrogen starvation that it was necessary to begin fertilizing them in 1920.

In this same orchard about 50 other trees, also planted in 1908, were seeded down to alfalfa about 1913. This land has been reseeded

(Continued on page 400)

The bottom of the barrel—

THERE was an old lady who took only a spoonful or two of flour from a barrel each day and noticed that the bottom was still far away. She exclaimed, "Why this barrel of flour will last forever."

But the bottom finally came.

In your soil there are three plant foods—nitrogen, phosphorous and potash. Every crop you grow takes its toll of each of these three elements. You replace some of the food by growing legumes, by rotating your crops, and by returning the farm manure.

But do you return all the potash that is removed? If you do not, there will come a day when the "bottom of the barrel" will be reached.

Manure alone will not do it. You must add potash to your mixed fertilizer, or buy mixed fertilizer that contains plenty of potash.

The use of potash is profitable. Potash pays.

If you buy mixed fertilizer insist on a formula that is high in potash.

Your dealer has Genuine German potash in stock, either in the form of mixed fertilizer or in 200 pound sacks.

Should he be temporarily out of it, write us and we will tell you how and where to get it in the grade you wish.

Since May 1st, 1923, the distribution of German Potash, formerly managed in this country by the German Kali Works and the Potash Syndicate, has been controlled by the

SKINNER MACHINERY CO., Fourth St., DUNEDIN, FLORIDA

There was nothing elaborate in the exhibit of "Cataract Brand" apples in New York's exhibit at the recent Fruit Show in New York City. The Western New York growers put on a real commercial exhibit and for that reason it was most impressive. In the foreground are the cross-sections of barrels of apples showing the uniformity of pack from top to bottom. The New York exhibit consisted of barreled apples of interest to the commercial buyer. On the right is the grader which was used in demonstrating to visitors how Western New York apples are graded and packed.

Walsh No-Buckle Harness

NO BUCKLES TO TEAR

NO RINGS TO WEAR

**30 DAYS
FREE TRIAL**

Post Yourself

on this new way of making harness, which is three times stronger than buckle harness. Before you buy harness, let me send you a set of Walsh No-Buckle Harness on 30 days' Free Trial, to show you why this harness is three times stronger without buckles, better looking and handier in every way. If not convinced, send it back at my expense. The Walsh is a proven success on thousands of farms for over 8 years.

Three Times Stronger Than Buckle Harness

Buckles weaken and tear straps. Walsh 1½-inch breeching strap holds over 1100 lbs. The same strap with buckles will break at the buckle at about 350 lbs. pull. Ordinary harness has 68 buckles. Walsh Harness has no buckles. Easy to see why Walsh is three times stronger than ordinary harness. Packer's Northern Steer Hide Leather—best that can be tanned. **COSTS LESS — LASTS TWICE AS LONG** The Walsh Harness costs less because it saves many a dollar in repairs. Users show average repair cost of only 9 cents per year. No patching, no mending, because no rings to wear straps in two, no buckles to weaken and tear straps. Greatest advance in harness making. Easily adjusted to fit any horse. Write today for new reduced prices. **\$5 AFTER THIRTY DAYS' FREE TRIAL** Balance easy payments, or cash after trial if you wish. Write today for free book, prices, easy payments and thirty days' trial offer, also how to make money showing Walsh Harness to your neighbors. **James M. Walsh, Pres., WALSH HARNESS CO.** 511 Keefe Ave., Milwaukee, Wisconsin

Among the Farmers

League Announces December Prices—County Notes

THE Dairymen's League Cooperative Association, Inc., has announced the prices for December milk. These prices are based on 3 per cent. milk in the basic zone of 201 to 210 miles from New York City.

Class 1 milk entering into fluid consumption, \$2.80 per 100 pounds.

Class 2A milk which goes into the manufacture of cream, \$2.10 per 100 pounds, which is 5 cents above the price for November.

Class 2B milk which goes into the manufacture of condensed milk and ice cream, \$2.35 per 100 pounds.

Class 2C milk which goes into the manufacture of soft cheeses, \$2.35 per 100 pounds.

Class 3 milk which enters into the manufacture of powdered, condensed and evaporated milk, as well as hard cheeses, \$2.15 per 100 pounds.

Class 4 milk which enters into the manufacture of butter and cheese will be determined by the quotations of these commodities on the New York market.

Whitney Point for 75 cents a bushel. At the stores and the Endicott-Johnson market about one dollar is the ruling price.

Considerable fall plowing has been done in this county and vicinity. For a time the soil was too dry to do good work, but an abundance of rain removed this handicap.

A piece of road northeast from Main village a mile in length has been improved. It was formerly a very heavy road and the macadam is very much appreciated. It should be carried on farther, however.

Still another highway project is the promised building of a road along the south line of the Lackawanna R. R., from Westover to Gray's Crossing, eliminating an overhead crossing which has been one of the most dangerous in this part of the country.—E. L. V.

NEW JERSEY AGRICULTURAL WEEK, JANUARY 15-18

Agricultural Week in New Jersey will extend from January 15 to 18 inclusive. The Farm Products Show will be held at Trenton, N. J. This show has become one of the features of the agricultural program of the State. Every year the features of agricultural week are becoming more popular. One of the outstanding points of last year's Farm Products' Show was the great display of the Jersey Black Giants in the Poultry Department. The potato exhibits have also become a very attractive department of the show.

The official agricultural convention will be held in the Assembly Chamber, State House, Wednesday, December 16.

Mercer Co.—This year's apple crop turned out very well. Large quantities of poultry are going to market. The corn crop is also good, although some fields show considerable root rot. The first test in the community corn shows that the crop is to pass free of root rot. The farm bureau membership drive was conducted from November 12 to 16.—Mrs. J. E. H.

L. J. Taber, Master of the National Grange

RESOLUTIONS PASSED AT ANNUAL MEETING OF NATIONAL GRANGE

PROBABLY the outstanding resolutions adopted at the annual meeting of the

National Grange were those requesting the installation of a dairy bureau in the Department of Agriculture; the recommendation of a gasoline tax for the support of highway construction and maintenance; endorsement of cooperative marketing; sanctioning the plan of the Secretary of Treasury to discontinue the issuance of tax-free securities and urging in time of war a draft of wealth and industry as well as men for the army.

The election of L. J. Taber of Ohio as Master of the National Grange is looked upon as a compromise between the radicals and the conservatives.

The National Grange now claims a membership of 1,000,000 scattered over every State in the Union. Records show a growth of 80,000 in the past four years. It is also stated that during this period 855 new subordinate granges have been organized. Financially the National Grange is in an exceptionally healthy condition.

This year's meeting was declared by the officials to be the most successful in many years. The attendance was much larger than early estimates indicated. Thirteen States are represented on the new staff of officers elected at this meeting, which were announced in last week's AMERICAN AGRICULTURIST. The States represented on the staff range from Idaho in the West to New Jersey in the East and Vermont in New England.

NEW YORK FARM NEWS

Rensselaer Co.—Cider mills are running on full time. H. P. Hood & Son are enlarging their ice ponds. Many farmers are reducing their flocks of sheep. The onion crop this year yielded heavily and at the present time is practically all in the buyers' hands. Growers received a fair price. Several of our well-to-do farmers are going to Florida to spend the winter. Several of them have been doing nicely in the real estate business down south.—C. H. Y.

Greene Co.—The dry spell of the past season was mighty severe on crops. Hay made only a half a crop. Pears were almost a complete failure. The apple crop was also less than half. In orchards, especially which were not sprayed, the fruit was very poor. On the other hand potatoes turned out fairly well. They are bringing \$1.25 a bushel now. They have been higher in some sections. Buckwheat is bringing \$1.00 a bushel, corn \$1.40. Fresh cows are in good demand and are bringing good prices. Hay is bringing \$20 a ton.

Along the Southern Tier of New York

Potato digging is out of the way now. The crop was better than it looked as if it would be at one time. Potatoes are being carried at

PENNSYLVANIA FARM NEWS

The price of eggs has advanced to war figures. Reading, Allentown, Lebanon and Harrisburg markets report the prevailing quotations for best grades at 70 to 85 cents per dozen. Dressed poultry commands good prices.

Travels through the farming districts reveal a considerable acreage of unhusked corn in shocks. The average yield is better than expected, while the present value also exceeds former figures.—OLIVER D. SCHOCK.

Jefferson Co.—The Community Day held at the Henderson Grange Hall was a grand success. A large crowd was in attendance and all greatly appreciated the program of the day.

The nine schools of the township put on exhibits consisting of art work, agricultural products and fancy work. Prizes were awarded for these exhibits as follows: First Prize, Pifer School—\$5. The second prize of \$3 went to the Henderson School and a third prize of \$2 was given to the Desire School.

The program in the afternoon included addresses by the Reverend Victor M. Thompson of Big Run; Professor C. A. Anderson, County Superintendent of Schools; Professor Schmidt, potato specialist from State College; Professor Joseph Vial, specialist on horses from State College; and Dr. Thomas, president of State College.—C. I. G.

The Cooperative's "Hired Man"

(Continued from page 389)

principle is at stake and that on each the responsibility for making that principle win out. This means that there must be mutual "give and take" and understanding between officers and employees, and the existence of such understanding has been one of the chief reasons for the success of the cooperative movement so far.

Takes only 50 days to get a real job

"My garage and Ford Agency is a big success. I owe it to Rahe training." G. Smith, W. Alexandria, Ohio.

"Rahe Training was the best investment I ever made." Colby Lord, Oakland, Maine.

"I thank Rahe Training for a great job in the best garage in Lima." Howard Metzger, Lima, Ohio.

In the Auto and Tractor Business

Read what these men are doing—here is your big chance to get "on easy street." Come to these great shops on the biggest FREE offer ever made.

Big Firms Need Trained Men

The Auto and Tractor Business is on the boom. Thousands of trained men will be needed during the next few months. I get calls every day from Garages, Battery Stations, Auto Repair, Welding Shops and other successful concerns for Rahe men. When the big fellows need high grade men they know where to come for them. They want Rahe trained men.

My Training Unusual

Scientific tool training—that's the secret. You do things here according to the latest engineering standards. Thousands of dollars have been spent in modern tools and equipment. That's why my men are at home with the biggest shops in the country. If you want to succeed the way Smith and Metzger and the rest have—qualify by the same method.

I'LL PAY YOUR RAILROAD FARE AND BOARD YOU!

In order to fill the openings that now exist, I am making an offer no one has ever made before—Free Railroad Fare. Free board. But even that is not all. I'll tell you about the rest in my letter.

Send for FREE Book

My big illustrated training book tells how others are succeeding. It tells many things you ought to know about Autos and Tractors. Write for it and my short time offer NOW. It soon expires.

EAT MORE WHEAT

FIVE DELICIOUS DESSERTS FROM THE SAME DOUGH

CHEESE CAKE

Turn dough on board, roll half an inch thick. Line a well greased baking tin with the dough, prick well with a fork all over, allow the dough to rise 15 minutes and fill with the following mixture.

$\frac{1}{2}$ lb. cheese; 3 eggs; $\frac{1}{4}$ cup sugar; 2 cups milk; 1 teaspoonful vanilla flavoring.

Rub the cheese and yolks of eggs together until smooth, dissolve sugar in milk, beat the whites of eggs to a froth and add to the cheese and yolks, then add the milk and sugar. Fill baking sheet and sprinkle with a little cinnamon. Bake slowly. (This recipe makes two cheese cakes.)

APPLE CAKE

Turn dough on bread board, roll half an inch thick. Place in two well greased, shallow pans. Brush with butter, sprinkle with sugar. Cut apples in eighths and press into dough, sharp edge downward. Sprinkle with cinnamon. Cover and let rise about one half hour. Bake twenty minutes. Keep covered with pan for first ten minutes in order that the apples may be thoroughly cooked; All kinds of fruit cake can be made using seasonable fruit.

Our Home Economics Department was established to help you teach your family to eat more wheat.

There are hundreds of ways to turn wheat into delicious, easily made dishes. You can make Apple Cake, Cheese Cake, Vanilla Crescent, Butterscotch Bread and Filled Doughnuts all from one dough and each will look and taste different.

Try some of them next baking day.

We guarantee your success provided you use the recipe and methods given here and Gold Medal Flour.

If you want other recipes or culinary suggestions write our Educational Department, Minneapolis, Minn.

RECIPE FOR DOUGH

$4\frac{1}{2}$ cups sifted Gold Medal Flour	2 cakes yeast
1 cup milk, scalded and cooled	$\frac{1}{4}$ cup butter
$\frac{1}{2}$ cup sugar	$\frac{1}{4}$ teaspoon salt
	2 eggs

Method: Crumble yeast into a bowl, slowly add the milk and stir to dissolve the yeast. Add the sugar, beaten eggs, salt and flour, mix, add the melted butter and mix very thoroughly. Turn out on floured board, knead into a smooth dough. Place in well-greased bowl. Cover and set aside to rise—let double in bulk, about two hours. Knead down and let rise 45 minutes.

Note: If dry yeast is used make one cake into a sponge the night before, using all the liquid and one half the amount of flour given in above list of ingredients. Then add the rest of the ingredients in the morning and mix to a soft dough.

VANILLA CRESCENT

Roll out dough to $\frac{1}{2}$ inch in thickness, cut into triangular pieces, brush over with butter, sprinkle with sugar and roll up into crescents, so that the outer end is in the middle of the length and on the outside of the roll. Lay in crescent shape on well greased baking sheets; allow to rise until double original size, brush over with egg and bake in moderately hot oven. (375 degrees). After baking, frost with powdered sugar icing. In making icing rub powdered sugar free of all lumps and add slowly just enough liquid to make moderately thick paste. (Water will make a more transparent frosting than milk). Add halved blanched almonds before frosting hardens.

FILLED DOUGHNUTS

Turn dough on floured bread board and roll out in a rectangular shape $\frac{1}{4}$ inch thick. Brush dough with water, drop $1\frac{1}{2}$ teaspoons of prune filling on half of the dough three or four inches apart. Fold the second half over the first. Cut out with a round cookie cutter and let rise until light or double in bulk. Fry in deep fat until brown. Drain on unglazed paper and roll in a mixture of powdered sugar and cinnamon. **Prune Filling:** Soak $\frac{1}{2}$ pound of prunes for several hours, or until soft. Place over flame and bring to a boil. Remove the stones while hot. Run through a meat chopper. Sweeten to taste and flavor with rind of one or two lemons.

BUTTERSCOTCH BREAD

Rollout dough to fit in square tin one half inch thick. Cover, let rise. Brush over with melted butter and at two inch intervals make parallel rows of three-fourths inch depressions, using forefinger. In depressions thus made put a bit of butter and fill with brown sugar. Sprinkle with two tablespoons brown sugar mixed with one teaspoon cinnamon and bake in a moderate oven thirty-five minutes.

WHY NOT NOW?

Work in comfort — Keep your feet dry — Get longer service — with **HOOD** footwear

THERE is the meat of the Hood Story told in ten words—work in comfort, keep your feet dry, get longer service.

Hood comfort comes from proper designing — re-enforcements placed exactly where they belong, and better rubber and scientific compounding to give more wear, with no clumsy weight.

Leaky boots are frequently caused by exposure to the sun and air. While no boot can stand undue exposure, the Hood Process so guards against this danger that Hood Boots and Overshoes remain exceptionally free from cracks and leaks.

Hood soles of tire-tread stock are built for long wear *under all conditions.*

Write for the Hood Buying Guide

HOOD RUBBER PRODUCTS CO., Inc.
Watertown, Massachusetts

If you are not familiar with the latest developments in rubber footwear, it will pay to step into the store and examine a Hood Boot, or a Hood Kattle King, or a pair of White Rock Rubbers. Find out how Hoods are serving other men in your locality.

You will be interested in the Kattle King and Wurkshu combination. The Wurkshu is a strong, durable canvas shoe, that does not bind or cramp the foot. Men are wearing them under the Kattle King, a fleece-lined, all-rubber gaiter. At night the Kattle Kings are quickly and easily cleaned, and there is no need to change the Wurkshu—they are as comfortable as slippers.

Look for the Oval Sign. It identifies the Hood store—a good place to trade.

Almost ready to fill Dad's shoes!

Handling Raw Furs—The Fur Outlook

Returns from Furs Depend on How They Are Handled

THE sum secured for a collection of raw furs depends to a great extent upon the way they have been handled. Furs that have actually been damaged in handling will grade way down, and fetch perhaps less than half the price of prime, No. 1 furs. Generally, properly handled furs will bring around 10 per cent. higher prices than carelessly handled furs. This is quite a percentage on a large lot of furs.

In the ordinary trapper's collection, as observed by the writer in several years of fur buying, about 10 per cent. will run to blue or unprime, 10 per cent. damaged by tacks, nails, traps or dogs' teeth; a smaller percentage damaged by improper curing, while as high as 50 per cent. will be shaped wrong in stretching. Hence it will be seen that many things

By DICK DuBOIS

late spring will do more toward exterminating the animal than shotgun and dynamite would in the fall. This is explained by the fact that the females are usually with young by May, and for this reason muskrats should not be trapped too late.

Trappers living in the northernmost States complain that the lakes and streams remain frozen until almost the end of April, and even the first of May some years, and that they do have a chance to trap prime 'rats until the ice breaks. Which is true enough; yet these trappers might better be content with what winter 'rats they get than to endanger the future supply of the animal. It is better to be able to trap a hundred winter 'rats than ten spring 'rats. As a matter of fact, the winter 'rat is very little short in quality of the spring 'rat; however, the latter grade sells for about one-fourth more money than the former.

Telling a Prime Pelt

Prineness in the case of most furs is denoted by a creamy-white pelt and full, glossy fur. Unprime furs show blue or streaked on the pelt side, and under fur below the guard hairs will be short and thin. Prime muskrat skins are red to a whitish color—blue 'rat skins grade "fall."

Toward spring many furs, notably skunk and fox, become rubbed or shedded, even before the pelt changes color. These grade down, for the rubbed spots must be cut out in the manufacturing process. Badly rubbed furs grade down as low as 3 and 4, slightly rubbed grade as 2. No. 1 pelts must be prime, of good quality and color and undamaged. Most fur lists quote three prices for No. 1 furs; large, medium and small.

All farmland fur-bearers should be skinned "cased" except raccoon, coyote, badger and beaver. To skin an animal cased, cut the skin from heel to heel, cut around the tail and strip the hide down over the body, leaving all the fat possible on the carcass instead of on the skin. Use the knife gently around the forelegs, ears, eyes and nose.

Green Skins May Need "Fleshing"

The green skins may need a little "fleshing," and after this is done, they should be stretched over a board shaped to conform with the skin. My method is to flesh the skins after they are stretched on the boards. I use a dull knife and only take off the gobs of thick fat that would cause "sweating." Besides fat on hides weigh up into pounds when it comes to shipping a hundred or so by parcel post or express.

Cased skins should be hung up by the nose end of the boards in a shady, airy place. Never attempt to cure raw furs by the use of salt, alum, sunshine or artificial heat.

Skinning the Tail

The tail bone should be removed from the tails of all animals except opossum and muskrat; leave the tails on the carcasses of these latter animals. The tails are easily skinned by slitting one-third way, then using a split stick to skin the rest. If the tail of greasy furs like skunk should start to taint, use salt liberally to save them. A hole should be punctured in each tail to allow for circulation of air, and draining.

"Open skins" are cut down the belly and peeled off like a beef skin is taken off. They should be fleshed and tacked up on the inside walls of a shed or barn to cure. A skin will cure in about four days, unless the weather is damp.

There are several books on trapping that illustrate the proper shapes and sizes for stretching boards; and some fur houses sell patterns for boards. Others sell steel stretchers, and while they cost more than wooden ones, they will last longer, are more compact and cure the furs quicker. They are much more portable than wooden ones.

THE WINTER FUR MARKET

ISAAC NOTES

I HAVE just been interviewing a number of Chicago raw fur buyers in regard to the prospects for good prices this winter, and what kinds of furs are likely to be in greatest demand. Some of the information I gained is so important that I want to pass it on to young trappers at once.

No fur buyer will make any definite prediction this early in the season (Nov. 5th) as to what the fur market will be this winter. They all say that whether certain furs are to be high

or low in price will depend upon the demand for these furs. It is all a question of which furs fashion decrees shall be most popular with American women. From present indications, however, some buyers think muskrat and skunk fur will range low in price, as the demand for these furs is not strong at present. The American woman doesn't take kindly to the thought of wearing skunk fur. But when these pelts are dressed, dyed, etc., and then fashioned into attractive scarfs or capes, they are sold under the name of black marten, and the demand may be good later in the season under this trade name, despite the handicap of the animal's real name.

It is to be hoped that this may prove to be the case, for the skunk is one of our most widely distributed fur bearers in North America, it is easily caught, and with care it may be killed in the trap and skinned without its discharging its scent.

Some fur buyers with whom I talked seem to think the demand will be good this winter for pelts of the mink, opossum and coon, also the weasel, both white and brown; also all of the foxes, as well as the finer furs like pine marten, beaver, otter and fisher. Some of these finer furs are not very widely distributed over the United States, and are becoming very scarce. However, there are many of the more common foxes, also mink, opossums, coons and skunks, so perhaps the farm and ranch boys who trap this winter will find it to their advantage to concentrate their efforts largely upon these five species of animals and allow muskrats to increase their number for a while. Fashion is fickle, and muskrat fur may be in great demand within another twelve months. The very best grades of Canadian muskrat pelts are even now in demand. These fine pelts are sheared—that is, the ends of the longer fur are cut off to an even length with the main mass of the fur—then dyed and made into medium priced "sealskin" coats known to the trade as Hudson seal.

Ship Furs Early

Every raw fur buyer with whom I talked advised marketing early caught furs early in the season, as soon as they are sufficiently dry to be sent to market. They will bring better prices now, buyers say, than later in the season, because they will not grade up as well then in comparison with better furs caught in mid-winter, which will then be coming upon the market. They will bring a better price now, because there are no very fine raw furs being placed upon the market. Every trapper knows that pelts taken in January and February are better than those taken in November and early December.

So don't delay sending your catch to market early because it makes but a small package. It costs but little for express charges to send a compact little bundle of pelts like muskrat, house cat, opossum, weasel or skunk, and still

Coon Skins Drying Flat

less by parcel post, the latter method of marketing being the cheapest and safest for very small packages, but in every case you should have the package insured, which means but a very little additional cost—from 3 to 5 cents, I believe. It is best to send skunk pelts by express, especially if any unpleasant odor attaches to them. The postal employees might refuse to receive them in such cases.

A point impressed upon my mind by the fur dealers was that there is a market for many of the cheaper pelts which some boys would not take the trouble to skin carefully, or which

LET US TAN YOUR HIDE.

Horse or Cow hide, Calf or other skins with hair or fur on, and make them into coats (for men and women), robes, rugs or gloves when so ordered; or we can make your hides into Oak Tanned Harness or Slaughter Sole or Belt Leather; your calfskins into Shoe Leather. Colors, Gun Metal, Mahogany, Russet or lighter shade. Calfskins tanned in the lighter shades of shoe leather, also make elegant stand and table covers; great for birthday, wedding and holiday gifts.

LET US FIX YOUR WORN FURS

freshen, repair and reshape them if needed. Furs are very light weight, therefore it would cost but little to send them in to us by Parcel Post and get our estimate of cost; then we will hold them aside awaiting your decision. If you say "go ahead," very well; we will do so and hold them free of storage until you want them. If you say "no," we will return them post-paid.

Our illustrated catalog and style book combined gives a lot of useful information. It tells how to take off and care for hides. About our safe dyeing process on cow and horse hides, calf and fur skins. About dressing fine fur skins and making them into neckpieces, muffs and garments. About taxidermy and Head Mounting.

A Properly Stretched No. 1 Skunk Pelt

must be considered in preparing raw furs for the market in such a manner as to obviate the possibility of the buyer "cutting the grade." Any violation of these methods of preparing fur afford the dealer an excuse for deviating from his printed prices. If the furs are strictly prime, undamaged and properly cured and stretched, there is no leeway for grading down or cutting prices. The trapper or fur shipper may calculate to a dollar what his furs will bring, provided he is only fairly adept in judging fur quality, and grading for size.

No Excuse for Unprime Furs

There is no excuse whatever for trapping unprime furs. Night hunters, using dogs, should not kill the animals before their hides are prime. Happily most States have laws that prohibit hunting and trapping before the winter season is sufficiently advanced to insure fur primeness. This means that trapping will start between the first and fifteenth of November, except in the extreme South, where furs are only prime during December and January. In the States bordering Canada, and in high altitudes, such as the Adirondacks and Rockies, furs may be prime by the twentieth of October and remain prime for six months, but this condition does not apply to farming country. Where the climate will permit crops to mature, furs are never prime before November.

To be on the safe side the trapper should not actually set his traps out until the tenth of November, which is the opening day of the season in New York State, where furs prime sooner than in any other State of the Union.

Avoid Late Spring Trapping

Spring trapping depends on the animal being taken. Trapping for skunks and foxes at least should stop at the end of February in the North and two weeks sooner in the South. Muskrats are at their prime in February and March. They are also prime in April in most of the Northern States, and well up into May in the high altitudes and cold waters of the mountains. However, persistent trapping in

BEST EXTENSION LADDERS made, 25 cents per foot. Freight paid. A. L. FERRIS, Interlaken, N. Y.

The Broad Highway—By Jeffery Farnol

"TEN minutes!" cried a voice; "'e won't last five—see if 'e do."
 "Feel sorry for un," said a second; "'e do be so pale as a sheet a'ready."
 "So would you be if you was in 'is shoes!" chimed in a third; whereat there was a general laugh.

Indeed, as I looked round the ring of grinning, unresponsive faces, it was plain to see that all sympathy was against the stranger, as is the way of bird, beast, fish, but especially man, the world over—and I experienced a sudden sense of loneliness which was, I think, only natural. Yet, as I put up my hand to loose the strap of my knapsack, I encountered another already there, and, turning, beheld Simon the Innkeeper.

"If it do come to fightin'," he whispered close in my ear, "and I'm fair sure it will, keep away as much as you can. Moreover, whatever you do, watch 'is right, and when you do see a chance to strike, go for 'is chin—a little to one side—and strike danged 'ard!"

"Many thanks for your friendly advice," said I, with a grateful nod.

"Come," said Black George, at this juncture, "I've work waitin' to be done."

"I'm quite ready," said I, stepping forward. It was now arranged that, standing alternately within the circle, we should each have three throws—whoever should make the two best throws to win.

Hercupon, the smith took his place within the circle, hammer in hand.

Now, as probably every one knows, it is one thing to swing a sledge-hammer in the ordinary way but quite another to throw it any distance, for there is required, beside the bodily strength, a certain amount of knowledge, without which a man is necessarily handicapped. Thus, despite my opponent's great strength of arm, I was fairly sanguine of the result.

BLACK GEORGE took a fresh grip upon the hammer-shaft, twirled it lightly above his head, swung it once, twice, thrice—and let it go.

With a shout, Job and two or three others ran down the road to mark where it had fallen, and presently returned, paeing out the distance.

"Fifty-nine!" they announced.

"Can 'ee beat that?" inquired Black George complacently.

"I think I can," I answered as, taking up the hammer, I, in turn, stepped into the ring. Gripping the shaft firmly, I whirled it aloft, and began to swing it swifter and swifter, till, like a flash, it flew from my grasp. Panting, I watched it rise, and then plunge down to earth in a smother of dust.

"E've beat it!" cried the Ancient excitedly. "Lord love me, 'e beat it!"

"Ay, 'e 've beat it, sure-ly," said a man who carried a rake that was forever getting in everybody's way.

"Ah! but Jarge arc n't got 'is arm in yet," retorted a third; "Jarge can do better nor that by a long sight!" But now all voices were hushed as Job paced up.

"Eighty-two!" he announced. Black George looked hard at me, stepped sulkily into the ring, moistened his palms, looked at me again, and seizing the hammer, began to whirl it. Round and round it went, faster and faster, till, with a sudden lurch, he hurled it up and away. Indeed it was a mighty throw! Straight and strong it flew, describing a wide parabola ere it thudded into the road.

THE excitement now waxed high, and many started off to measure the distance for themselves, shouting one to another as they went. As for the smith, I saw that the twinkle was back in his eyes again.

"One hunner and twenty!" cried half-a-dozen voices.

"Can 'ee beat that?" inquired Black George again.

"It was a marvelous throw!" said I, shaking my head. And indeed, in my heart I knew I could never hope to equal, much less beat, such a mighty cast. I therefore decided on strategy, and, with this in mind, proceeded, in a leisurely fashion, once more to mark out the circle, to roll up my sleeves, and tighten my belt; in fine, I observed all such precautions as a man might be expected to take before some supreme effort.

"Means to do it this time!" cried the man with the rake, knocking off Job's hat in his excitement, as, with a tremendous swing, I made my second throw. There was a breathless silence as the hammer hurtled through the air; then came a shout of laughter, for the distance was palpably short. A moment later Job came paeing up, and announced:

"Eighty-seven!" Hereupon arose a very babel of voices:

"You 've got un beat a'ready, Jarge!"

"Well, I knowed it from the start!"

"Let un alone," cried Simon, "'e 've got another chance yet."

That my ruse had succeeded with the crowd was evident; they—to a inan—believed I had done my best, and already regarded me as hopelessly beaten. My chance of winning depended upon whether the smith, deluded into a like belief, should content himself with just beating my last throw.

It was with a beating heart, therefore, that I watched him take his place. He took up the

hammer with such a businesslike air that my heart sank, and, feeling a touch upon my arm, I was glad to turn away.

"I be goin' to fetch a sponge and water," said Simon.

"A sponge and water!"

"Ah! Likewise some vinegar—their 's nothin' like vinegar—and remember—the chin, a little to one side preferred."

And, with a friendly nod, the Innkeeper turned away. In that same minute there arose another shout from the crowd as they greeted Black George's last throw, and Job, striding up, announced:

"Ninety-eight!"

THEN, while the air still echoed with their plaudits, I stepped into the ring, and, catching up the hammer, swung it high above my head, and, at the full length of my arms, began to wheel it. The iron spun faster and faster till, setting my teeth, with the whole force of every fiber, every nerve, and muscle of my body, I let it fly.

The blood was throbbing at my temples and my breath coming fast as I watched its curving flight. And now all voices were hushed so that the ring of the iron could be plainly heard as it struck the hard road, and all eyes watched Job, as he began pacing towards us. As he drew nearer I could hear him counting to himself, thus:

"Ninety-five, ninety-six, ninety-seven, ninety-eight, ninety-nine, one hundred, one hundred and one, one hundred and two—one hundred and two."

Next moment, as it seemed to me, an inarticulate Ancient was desperately trying to force me into my coat, wrong side first, and Simon was shaking my hand.

"You trieked me!" cried a voice, and turning, I found Black George confronting me with clenched fists.

"And how did I triek you?"

"I could ha' ehucked farther."

"Then why didn't you?"

"Because I thought you was beat. I say you trieked me."

"And I tell you the match was a fair one from start to finish!"

"Put up your hands!" said the smith, advancing in a threatening manner.

"No," said I, "a bargain is a bargain."

"Put up your hands!" repeated Black George hoarsely.

"For the last time, no," said I. "Strike me if you will," I went on, seeing him raise his fist. "I shall not defend myself, but I tell you this, Black George, the first blow you strike will brand you coward, and no honest man."

"Coward, is it?" cried he, and, with the word, had seized me in a grip that crushed my flesh, and nigh swung me off my feet; "coward, is it?" he repeated.

"Yes," said I, "none but a coward would attack an unresisting man." So, for a full minute we stood thus, staring into each other's eyes.

WHAT would have been the end I cannot say, but there came upon the stillness the sound of flying footsteps, the crowd was burst asunder, and a girl stood before us, a tall, handsome girl with raven hair, and great, flashing black eyes.

"Oh!—you, Jarge, think shame on yourself—think shame on yourself, Black Jarge. Look!" she cried, pointing a finger at him, "look at the great, strong man—as is a coward!"

I felt the smith's grip relax, his arms dropped to his sides, while a deep, red glow crept up his cheeks till it was lost in the clustering curls of gleaming yellow hair.

"Why, Prue—" he began, in a strangely altered voice, and stopped. The fire was gone from his eyes and he made a movement as though he would have reached out his hand to her, but checked himself.

"Why, Prue—" he said again, but choked suddenly, and, turning away, strode back

towards his forge without another word. I thought there was something infinitely woe-begone and pitiful in the droop of his head.

Now as I looked from his forlorn figure to the beautiful, flushed face of the girl, I saw her eyes grow wonderfully soft and sweet, and brim over with tears. And she also turned, and, crossing swiftly to the inn, vanished through its open doorway.

"She 've a fine sperrit, 'ave that darter o' yours, Simon. Oh! a fine sperrit as ever was!" chuckled the Ancient.

"Prue arc n't afeard o' Black Jarge—never was," returned Simon; "she can manage un—allus could."

"Ah! she 'm a gran'darter to be proud on, be Prue," nodded the Ancient, "an' proud I be tu!"

"What," said I, "is she your daughter, Simon?"

"Ay, for sure."

"And your granddaughter, Ancient?"

"Ay, that she be, that she be."

"Why, then Simon must be your son."

"Son as ever was!" nodded the old man, "and a goodish son 'e be tu—oh, I've seen worse."

"And now," added Simon, "come in, and you shall taste as fine a jug of ale as there be in all Kent."

"Wait," said the old man, laying his hand upon my arm, "I've took to you, young chap, took to you amazin'; what might your name be?"

"Peter," I answered.

"A good name, a fine name," nodded the old man.

"Peter—Simon," said he, glancing from one to the other of us. "Simon—Peter; minds me o' the disciple of our blessed Lord, it du; a fine name be Peter."

So Peter I became to him thenceforth, and to the whole village.

CHAPTER XXV

WHEREIN I LEARN MORE CONCERNING THE GHOST OF THE RUINED HUT

AND after the Ancient and Simon and I had, very creditably, emptied the jug between us, I rose to depart.

"Peter," said the Ancient, "where be goin'?"

"The cottage in the Hollow," said I.

"What—th' 'aunted cottage?" he cried, staring.

"Yes," I nodded; "from what I saw of it, I think, with a little repairing, it might suit me very well."

"But the ghost?" cried the old man; "have ye forgot the ghost?"

"Why, I never heard of a ghost really harming any one yet," I answered.

"Peter," said Simon, quietly, "I wouldn't be too sure o' that. I wouldn't go a-nigh the place, myself; once is enough for me."

"Simon," said I, "what do you mean by 'once'?"

Simon shuffled uneasily in his chair.

"I mean, Peter, as I've heerd un," he replied slowly.

"Heard him!" I repeated incredulously; "you? Are you sure?"

"Sure as death, Peter. I've heerd un a-shriekin' and a-groanin' to 'isself, same as Gaffer 'as, and lots of others. Why, Lord bless 'ee! theer be scarce a man in these parts but 'as 'eerd um one time or another."

"AY—I've 'eerd un, and seen un tu!" croaked the Ancient excitedly. "A gert, tall think 'e be, wi' a 'orn on 'is 'ead, and likewise a tail; 't were Old Nick 'isself, all flame, and brimstone, wi' a babby under 'is arm!"

"A babby?" I repeated.

"A babby as ever was," nodded the Ancient.

"And you say you have heard it too, Simon?" said I.

"Ay," nodded the Innkeeper; "I went down into th' 'Oller one evenin'—'bout six months ago, wi' Black Jarge, for we 'ad a mind to knock th' 'owd place to pieces, and get rid o' the ghost that way. Well, Jarge ups wi' 'is

'ammer, and down comes the rotten old door wi' a crash. Jarge 'ad swung up 'is 'ammer for another blow when, all at once, theer comes a scream." Here Simon shivered involuntarily.

"A scream?" said I.

"Ah!" nodded Simon, "but 't were worse nor that." Here he paused again, and I was surprised to see that his broad, strong hands were shaking, and that his brow glistened with moisture.

"What was it like?" I inquired, struck by this apparent weakness in one so hardy and full of health.

"'T were a scream wi' a bubble in it," he answered, speaking with an effort, "'t were like somebody shriekin' out wi' 'is throat choked up wi' blood. Jarge and me didn't wait for no more; we run. Ecod! it do make me cold to talk of it, even now." Here Simon paused to mop the grizzled hair at his temples. "I tell 'ee, Peter, that place arc n't fit for no man at night. If so be you 'm lookin' for a bed, my chap, theer 's one you can 'ave at 'The Bull,' ready and willin'."

"An' gratus!" added the Ancient, tapping his snuff-box.

"Why," said I, "it is n't that I doubt your word, but my mind is set on the adventure. So, if Simon will let me have threepenny worth of candles, and some bread and meat—I'll be off, for I should like to get there before dusk."

NODDING gloomily, Simon rose and went out, whereupon the Ancient leaned over and laid a yellow, clawlike hand upon my arm.

"Peter," said he, "Peter, I've took to you amazin'; just a few inches taller—an' you'd be the very spit o' what I were at your age."

"Thank you, Ancient!" said I, laying my hand on his.

"Now, Peter, 't would be a hijious thing—a very hijious thing if, when I come a-gatherin' watercress in the marnin', I should find you a-danglin' on t' stapil, cold and stiff—'t would be a hijious—hijious thing, Peter, but oh! 'twould mak' a fine story in the tellin'."

In a little while Simon returned with the candles, tinder-box, and a parcel of bread and meat, for which he gloomily but persistently refused payment. Last of all he produced a small, brass-bound pistol, which he insisted on my taking.

"Not as it'll be much use again' a ghost," said he, with a gloomy shake of the head, "but a pistol's a comfortable thing to 'ave in a lonely place—specially if that place be very dark." Which last, if something illogical, may be none the less true.

So, having shaken each by the hand, I bade them good night, and set off along the darkening road.

CHAPTER XXVI

WHICH TELLS HOW AND IN WHAT MANNER I SAW THE GHOST

NOW, as I went, my mind was greatly exercised as to a feasible explanation of what I had just heard. That a man so old as the Ancient should "see things" I could readily believe, by reason of his years, but with Simon, a man in the prime of his life, it was a different matter altogether. That he had been absolutely sincere in his story I had read in his dilating eye and the involuntary shiver that had passed over him while he spoke.

Ghosts!—pshaw! What being, endowed with a reasoning mind, could allow himself to believe in such folly?

Yet here, and all at once, like an enemy from the dark, old stories leaped out and seized me by the throat: old tales of specters grim and bloody, of goblins, and haunted houses from whose dim desolation strange sounds would come.

Involuntarily I hastened my steps, but the sun had set ere I reached the Hollow. The great basin below me was already brimful of shadows. Indeed, it looked an unholy place in the half light, the very haunt of horrid goblins and specters, grim and ghastly.

(Continued on page 399)

THE STORY AS IT HAS PROGRESSED SO FAR

PLENTY of adventures have come to Peter Vibart, who has taken, disinherited, to the broad highway. He has been mistaken for his cousin, the rascally Sir Maurice, he has helped an unfortunate young gentleman to return to his lands and lady, he has rescued beauty in distress and heard of the charms of the Lady Sophia Sefton, whom he has never met but whom his uncle's will has bidden him marry to inherit the fortune.

Finally, Peter comes to a lonely cottage, where he meets a quaint old man who brings him to an Inn. Peter hears that "Black George," a hot-tempered smith, needs a helper. They determine on a hammer-throwing contest to see whether he should be hired.

18 *Guaranteed First-Quality* Hair Nets for only \$1

Lustrous, double-mesh hair nets, the kind you have bought two for a quarter, at less than 1/2 that price.

"FAIRYNETTES"

Cap-shape—close-fitting. Made of absolutely sanitary human hair. Fit the hair naturally—invisibly—retain the elasticity of your own hair.

18 nets in an envelope; each net wrapped in tissue.

This ridiculously low price of less than 6c per net is possible only because we sell direct from our own factory to you. Don't miss this opportunity. Send in your order to-day. You are sure to be pleased.

All you need to do is to check the color and size you wish, tear out this ad and send it to us with \$1.00. A package of 18 superior nets will be sent you at once. (C.O.D., if preferred.)

Money refunded if you find that these hair nets are not as good or better than the highest price net you have ever used.

DOUBLEDAY, PAGE & CO.
GARDEN CITY, N. Y.

Christmas Embroideries and Patterns

The Last Minuter Will Find Quickly Made Designs on This Page!

TO the left, the picture shows several designs which give the maximum amount of effect with the minimum amount of effort.

First is the stunning table set, worked on écreu linen, with bright blue flowers and black cross-stitch.

Set E 214: Center mat, 17 x 17 on écreu linen, 50c.

Place mats, 17 x 17, 2 for 50c.

Floss to work entire 5-piece set, 60c. To crochet edge; 2 d over edge, picot, 7 d over edge, chain 7 and catch back in 5th stitch from hook, d over chain back to edge, repeat.

No. E 214—Luncheon Set

No. E 213, A. B.—Handkerchiefs

No. E 502—Centerpiece

THEN there are handkerchiefs for all the family. The numbers and prices are as follows:

E 213—Children's handkerchiefs. A rooster, a striped dog and a hurry-up checked duck make delightful "hankies" for the youngster. On fine lawn, with gingham for the appliques, all three for 40c.

E 213 A—Ladies' handkerchiefs. Dark blue thread, to be drawn in stripes, and bright blue flowers make these very dainty. Fine white linen for two handkerchiefs, stamped, with floss for working, 50c.

E 213 B—Men's handkerchiefs. Also with dark blue thread to be drawn in stripes, and bright blue flowers. Fine white linen for handkerchiefs, stamped, with floss for working, 35c apiece, 70c for two.

TO the right is a centerpiece of really stunning effect—yet study it carefully and you will see how little work it takes. Nothing, you know, goes so fast as cross-stitch. We advise two colors, blue and black, rose and black, or delft blue and brick red, on the écreu linen. Isn't the black lace edge a smart touch? The piece has a diameter of 22 inches.

No. E 502. Centerpiece on écreu linen, 50c.

FOR WINTER DRESSMAKING DAYS

FOR either a new winter dress, in one material or a pretty and becoming "makeover" in two, No. 1919, a school-girl dress, is a most useful pattern. It comes in sizes 8, 10, 12 and 14 years and requires for the 8 year size, 1 1/2 yards 40-inch material with 1 1/2 yards 36-inch material contrasting. Pattern 12c.

YOU may need a frock in a hurry for some unexpected holiday gaiety! Then 1934 is the one for you, and the diagram shows how quickly and easily it can be made. Charming in velvet, satin or soft silk/crepe. No. 1934 cuts in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. For size 36, 4 1/2 yards of 40 inch material is required. Price 12c.

DURING winter weather, a high-necked, long-sleeved nightgown is the best provision against the cold. You can fearlessly open the window wide when you wear No. 9803! The pattern cuts in sizes 16 years, 36, 40 and 44 inches bust measure. The 36-inch size takes 3 3/4 yards 36-inch material with 2 1/4 yards edging. Price 12c.

TO ORDER: Be sure pattern numbers and sizes, your name and address are clearly written. Enclose proper remittance in stamps or coin (wrap coin carefully). Send to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

Christmas Ideas for Country Givers

Use Opportunities that Lie at Hand—Some Cranberry Recipes

IT is frequently inconvenient for the country woman to spend a great deal of time or money for the city cousins' Christmas gifts. Sometimes we do not make use of the material at hand which would make very pleasing presents for city dwellers.

Nearly everyone in the country has access to some kinds of foliage or berries which make beautiful Christmas decorations. Bittersweet berries have a remarkable keeping quality and are usually quite plentiful in all sections of the country. Care in picking should be used so as not to needlessly injure the vines. Those who live near the mountains can gather kinnikinnick or bearberry or other everlasting berries and foliage. Any evergreen plant should be stored in a damp place or at least dipped into water occasionally to prevent premature leaf dropping.

There are many kinds of everlasting flowers which may be made up into lovely winter bouquets. Grasses, cat-tails, milkweed pods, pine cones in clusters, may all be used effectively by tinting with colors and gilt or silver paint. A short walk on any country road will reveal many treasures to the observant eye.

Those who live in the nut districts have a gold mine at hand for supplying attractive Christmas gifts. Chestnuts, black walnuts, hickory nuts all make welcome gifts. The nut meats packed in glass jars are time saving gifts.

Those who make their own cottage or dutch cheese can prepare delightful surprises by filling paraffined containers, such as one buys ice cream in, with the cheese flavored if desired with pimentoes, green peppers, nuts, etc.

Mince meat is a most acceptable gift and may be easily sent in glass jars well packed or paper containers.

The ingenious person can easily add several articles to the list mentioned which would be inexpensive and easily secured and be very acceptable gifts.—RUTH CESSNA.

"ON THE SQUARE" GIFTS

HERE are some easily-made gifts, none of which takes much time.

Take a square yard of cretonne, hem or bind it all around, attach a small brass ring to each corner, run a ribbon or tape through and you have an extremely convenient laundry bag.

Piece bags, button bags, etc., may be made the same way by varying size and material to suit purpose for which bag is designed. These bags open flat so contents may all be seen and sorted quickly.

Oil-cloth or any rubberized cloth made into this style of bag is handy for bathing suits. A safety pin will, if fastened through the four rings, keep the bag closed even when it isn't hanging up.

A square yard of any fine pretty goods makes a lovely combing-jacket. Fold opposite corners together forming triangle. Cut along one fold, to center, cut circular or square opening there for neck, bind edges with bias binding or ribbon, add tape or ribbon ties at neck and it is finished.

Made of a heavy material this fashions a clever wrap for an invalid just able to sit up in bed. It is becoming, cozy, and easily adjusted.

A square of ciderdown; wool or flannel; or even a double-thickness square of cotton flannel; all bound with a dainty ribbon is a convenience for a mother of a young baby. It serves many purposes as shawl, blanket, lap-pad, etc. A pair of doll blankets made in a similar way will delight any small girl, and the boy will enjoy a colored blanket, plainly hemmed, for his wooden horse if he owns one.—MABELLE ROBERTS.

A CHRISTMAS ALBUM

IF you are one of those who married and went far away from relatives and friends perhaps this little Christmas suggestion of mine will interest you. Since I have lived on a farm, none of my relatives has ever visited me, but their letters often voice the desire to see where I live, so that at least they will know what the farm looks like.

With this thought in mind I decided to gather together all the kodak views of the farm that I could, mount them in a book and give them to relatives and close friends for Christmas gifts. After collecting all the back ones, I took some pretty scenes to fill out the year.

For the book I bought light grey cardboard and had it cut into pages four by five inches, just large enough to mount one picture. Holes punched in the end of each sheet were threaded with cord to hold the book together. I used black ink for the titles under the pictures.

On the cover of the book I printed in large letters, "Edgewood Farm" and inside on the first page I chose for the opening picture a view of the entire place as one approaches it over the top of the hill. Then followed the many different pictures of the house, the yard, the flowers, and the pasture along the river, snapshots of different animals and last but not least "The Farmer," "The Farmeress," "The Baby," "Shep" our faithful dog, and "The Cats."

I made three books and sent one to my grandmother, one to my parents and one to a far away college friend. Their letters of appreciation surely made me feel that my gift had been successful.—AGNES DUNSHEE ARNEY.

THE SELFISH CHILD

"I'm so worried about Paul," confided Mrs. Miller to her sister, a trained Kindergarten.

"What is the matter with Paul?"

"He's selfish," lamented the mother. "He grabs his candy in greedy little fists. He snatches the reddest apple and refuses baby sister a bite."

"Splendid little egotist," laughed the kindergarten. Then she sobered before her sister's grieved eyes.

"Paul is neither wicked nor depraved," she stated. "Selfishness is normal for a small child. It merely shows one of the great basic instincts, the instinct for self-preservation. If he is to live he must have many, many things. Instinct tells him to seize and to hold. Rightly trained, the ego instinct is a fine thing. Miriam Finn Scott in her book 'How to Know Your Child' tells us: 'When we try to analyze the faults of our children we discover that, in the majority of cases, the faults are only an unpleasant expression of forces that, in themselves, were originally admirable.' Selfishness is a valuable instinct, perverted."

"Now for methods," continued the kindergarten. "Don't expect some magic to eradicate selfishness over night. You must grow the flower of generosity and that is a long, slow, gradual process."

"But Cousin Kate told me that she cured Clara in an hour," protested the mother. "Clara refused to let a playmate take her doll and Kate flung it into the open grate. Clara cried and screamed but she was cured. Now she shares her possessions at a word."

Fright Doesn't Cure Anything

"Kate hasn't cured selfishness," pronounced the kindergarten. "She has instilled fear. That is like curing a wart on the finger by cutting off the arm."

"The correct way is to emphasize the joys of generosity. Don't nag about sister's tears when Paul is selfish. Smile about her happiness when brother is generous. Give him the privilege of passing candy to all your guests at table. Tell stories which emphasize the desirability of generosity, as Ruskin's 'King of the Golden River.' If he persistently refuses to share a toy, tell him, 'The fire engine can't stay with a selfish boy,' and put it away for a week. Do something daily to strengthen the generosity habit. The young child is incapable of genuine altruism. Above all, be honest."

"Meaning?" queried the mother.

"I was thinking of dangerous devices, descended from antiquity," explained her sister. "Probably prehistoric woman, observing her offspring clutching an unshared bone, covered her face with her hands and shrieked: 'Mother'll cry!'"

"Probably the child gave her a gnaw from the bone then, but he soon discovered that she was shamming and trading on his love to the point of hypocrisy. Be honorable."

"One more suggestion. Cultivate sensible selfishness yourself. The most ungenerous children I've known have belonged to sweetly sacrificing mothers. Don't give up your own desires and preferences when it is really not best for Paul that you should do so."

CRANBERRY TIME IS HERE

BETWEEN Thanksgiving and Christmas comes the ideal time for cranberries and though the jelly is probably the best known form of using this pretty red berry, there are numerous other ways of cooking it. The cranberry has a distinctive and unusual flavor and is a valuable addition to the usual winter fruits. One word of warning: pick over berries carefully, using only sound, unbruised ones. It will pay to sort out every under or over-

ripe berry, for these have a marked effect in the flavor of your finished product.

Cranberry Puffs.—Mix well four teaspoonfuls of baking powder, with two cupfuls of flour, one-half teaspoonful of salt, then add five tablespoonfuls of melted butter, and two well beaten eggs, and one cupful of milk. Stir in last one pint of washed cranberries. Fill buttered cups one-half full and steam one hour in a closely covered steamer or steam two hours in any favorite mold. Serve with a little whipped cream or merely sprinkle with powdered sugar.

Cranberry Fritters.—Add two tablespoonfuls of sugar to one well beaten egg, then add one and a half cupfuls of flour, and one teaspoonful of baking powder. When well mixed stir in one cupful of thick cranberry sauce and drop by spoonfuls on a hot greased griddle. Brown lightly and serve sprinkled with sugar.

Cranberry Dessert.—Beat the yolks of two eggs, add one cupful of sugar, one cupful of sweet milk, and about two cupfuls of flour, one teaspoonful of cream of tartar, and three-fourths teaspoonful of soda, sifted into the flour. Lastly add one cupful of stewed cranberries. Cut batter in two pieces and bake about one-half hour. For a delicious sauce beat to a stiff froth the whites of two eggs, in the meanwhile boil one-half cupful of water with one cupful of sugar, then add a teaspoonful of flour, or add a little cold water to the sugar and flour and pour into the boiling water. Cook till thickened, then add one teaspoonful of favorite flavoring, and pour over the beaten whites, then beat several minutes.

Cranberry and Raisin Pie.—Cook one quart of cranberries, and two cupfuls of seeded raisins, in water enough to cover for twenty minutes. Put two eggs in a bowl, with one big cupful of sugar and two small tablespoonfuls of flour, beat them together and stir into the boiling berries. Cook a few minutes until thick enough and then set back to cool. Add small piece of butter.

Cranberry Pudding.—Beat one egg and add one-half cupful of sugar and one-half cupful of sweet milk. Mix and sift one cupful of flour with one teaspoonful of baking powder. Combine mixtures and add one tablespoonful of melted butter and two-thirds cupful of cranberries. Bake in buttered muffin pans. Serve with hot maple syrup and whipped cream.

Cranberry Jelly.—Cook one quart of cranberries and one pint of water about ten minutes, strain through colander, return to kettle, add one pound of sugar, boil five minutes and turn into a jelly mold. Very delicious if a few chopped nut meats are added.

Cranberry Rice Meringue.—Line patty pans with puff paste, fill them with uncooked rice and bake till done in hot oven. When baked let cool and turn out rice. Then fill with rich jellied cranberry sauce, and spread with a meringue made of the white of one egg and one half cupful of powdered sugar. Put in oven and slightly brown to a straw color.

Cranberries and Bananas.—Stew one quart of cranberries in a little water with sufficient sugar for sweetening until very tender, then add a few chopped walnut meats and let cool. Meanwhile slice bananas into a dish and completely cover with whipped cream and grated cocoanut. Decorate with cranberries.—H. A. LYNAN.

"HELP WANTED"

CAN you suggest some way for taking care of the magazines and keeping them in order? We take a number and have difficulty in finding the one we want when we want it.—MRS. N. J. C., Pa.

Can any farm wife tell me how to make cream cheese? I can make only cottage cheese but I should like to know how to make the others too. I like to read the A. A. very much and read every recipe that is printed. If anyone will tell me how to make cream cheese I shall be glad to tell how I make cottage cheese.—MRS. D. R. A., Pa.

Send answers care of the Household Editor, AMERICAN AGRICULTURIST.

The Broad Highway

(Continued from page 397)

So evilly did the place impress me that it needed an effort of will ere I could bring myself to descend the precipitous slope. By the time I reached the cottage, it had fallen quite dark in the Hollow though the light still lingered in the world above. So I took out my tinder-box, and one of the candles which I succeeded in lighting, and, stepping into the cottage, began to look about me.

Reviewing the Latest Eastern Markets and Prices

MARKET OVERSUPPLIED WITH TURKEYS

HERSCHEL H. JONES

BY Tuesday, November 27, the New York market was completely overstocked with turkeys. The Thanksgiving trade reached its highest about the end of the previous week and earlier shipments of fancy turkeys brought 5 to 6c more than later. There was a large accumulation of freight turkeys in the hands of wholesale receivers, quantities of which were placed in cold storage to be held over for the Christmas trade. Fancy dry picked Virginia and Maryland turkeys sold at 35 to 45c just before Thanksgiving but earlier brought as high as 48 to 50c wholesale. Western dry packed turkeys were freely offered at 35c and many sales were made as low as 30c. Some of the best southwestern turkeys moved at 31 to 32c but 30c was the prevailing price toward the end of the market. Live turkeys, fancy selected by express brought 34 to 35c, average run 32 to 33c.

Dressed chickens were in liberal supply and sold slowly unless of exceptional fancy quality. Dressed fowls worked out slowly at irregular prices. The supply of ducks and geese was liberal and most of the stock was of medium and low grade. The best Maryland ducks sold as high as 25c per lb. just before Thanksgiving. For the Long Island ducks were held at 30c. The market was firm on express shipments of live poultry. Fowls, colored, fancy, heavy, by express sold at 30 to 31c; average 25 to 29c per lb. Leghorn fowls, fancy, large 23 to 24c; average run 20 to 22c. Chickens, fancy roasting, 30 to 32c; average run 26 to 28c. Rabbits, live, 26 to 30c. Pigeons, per pair, 45c.

APPLES CONTINUE DULL

The demand for barreled apples last week centered chiefly in the high-colored stock of large size and fancy quality. Receipts at New York were moderate but more than required for a dull market. The quality of a large part of the receipts was poor.

New York wholesale prices on barreled stock last week averaged about as follows, on A Grade Minimum 2½ inch stock: BALDWIN, best, \$4.50 to 5; few, fancy, \$5.25 to 5.50; ordinary, \$3.50 to 4. GREENINGS, \$5.75 to 6; fancy, \$6.25; ordinary to fair, \$4.50 to 5.50. HUBBARDSTON, \$3 to 4; KINGS, \$4 to 4.50; fancy, \$5. McINTOSH, best, \$8 to 8.50; few, fancy, \$9; ordinary, \$6.50 to 7.50. NONE SUCH \$3 to 4. NORTHERN SPY, best, \$5 to 5.50; fancy, \$6; ordinary, \$4 to 4.50. NORTHWESTERN GREENINGS, best, \$5 to 5.50; few, fancy, \$5.75 to 6. PE-WAUKEE, \$3 to 3.50. ROME BEAUTY, \$3.50 to 4; fancy, \$4.50 to 5. SNOW, \$5 to 6; ordinary, \$3.50 to 4. STARK, \$3 to 3.50. SUTTON, \$3 to 3.50.

Export shipments of barreled apples fell off

last week considerably. Shipments the week ending November 24 were only 108,000 bbls. and 120,000 boxes compared with 136,000 bbls. and 338,000 boxes the previous week. This decline should bring a better tone to the British market. Total figures of exports of both barrels and boxes show about twice the volume this year over last.

Car lot shipments of apples fell off all over the country last week. There were about 1,000 carloads less of both boxes and bbls. shipped last week than the previous week.

POTATO PRICES LOWER

The holiday last week affected the potato trade in the New York City wholesale markets because the buyers were busy with other items and bought only what they needed for immediate use. With prices in their favor they had everything their own way.

14.25. The market on country dressed veals has been very dull. Prime veals sold slowly at from \$13 to 15.

CHEESE MARKET UNSETTLED

The market on cheese remained unsettled. There has been light trading during the past week and generally at lower prices. Sales of fresh cheese both in New York City and up-State points have been made at lower levels.

BUTTER MARKET RECOVERS

Following the decline of last week butter reacted to a stronger position going back almost to the high point of the season. There is still a sharp demand for high grades. Foreign butter of good quality commands good prices. In New York City fresh Danish and Canadian brought 51 to 52c per lb. Imports were received from Syria, Italy, Argentine

"Thought you might be interested in knowing that there is cooperation among the farmers down here in this corner of the world.

"We have a whale of a market here this year. More prosperity than this country has ever seen before. Every farmer has cleaned up. Tremendous fruit crop brought fair prices. Alfalfa has made four and five tons to the acre and selling at the farm for \$20 a ton. Cotton is making everybody rich, yields averaging more than 500 pounds to the acre and selling here now at 30 cents a pound. Poultry, pigs and cows all making their owners money."

Alfalfa in the Orchard

(Continued from page 391)

twice. About 15 varieties were included in this plantation. Except for two trees which were killed by fire blight, these trees have done as well as adjoining trees in the cultivation—covercrop—fertilizer blocks.

Mice Injure Trees Mulched with Manure

Forty feet from some of these trees is a block which was mulched annually with manure. Every tree in this block was injured by mice but as long as the alfalfa stand contained no weeds none of the trees in the alfalfa blocks were touched by mice.

We should not dismiss the question of alfalfa sod in the orchard without a word about the general situation in this state. There are thousands of acres of splendid apple orchards which have stood in timothy and blue-grass sod for 20 years or more. So long as these have received annual applications of nitrogen either in manure or commercial fertilizers they have given excellent yields. In the hillside orchards of this state it has proved much cheaper and equally as satisfactory to cultivate the land with 5 pounds of nitrate of soda per tree and a mowing machine as to use the plow and the harrow.—R. D. ANTHONY.

The Winter Fur Market

(Continued from page 395)

hunters throw away when skinning their game. Thus, rabbit pelts bring a small price, whether jack-rabbits or the ordinary cottontails. These are generally bought at from 10 to 25 cents a pound, according to quality, size, care in skinning, etc. A rabbit is not difficult to skin, but it must be done with care, because the pelt is tender, and tears easily.

There is a market also for squirrel skins, but one dealer told me that this means the Russian squirrel. However, I'm sure that as a boy I often killed big black or red fox squirrels in midwinter (generally on sunny afternoons, when they occasionally come out of their holes in den trees) whose pelts would have sold for some price, if carefully taken off, stretched, fleshed, dried and sent to the proper market. The squirrel pelt is much tougher and stronger than the rabbit pelt, and since the latter sells certainly the former should do so also. I have certainly seen women and girls wearing scarfs which I know were made from pelts of the American red squirrel.

Mole skins also bring from 10 to 20 cents each, according to quality, size, etc. Some fur buyers do not want mole skins, so be sure to write your fur buyers before shipping, and ask them if they buy such furs. The pelt of the house cat also brings from 10 cents to a dollar, according to quality, size, etc. They are dyed and sold under the trade name of gennettes. There is a market also for lamb skins and kid skins, no matter how young the animals be when killed, though not all buyers handle them. That must be determined by correspondence.

Ship Furs Flat

Ship small furs to market flat, not rolled or folded over end to end. Wrap the bundle in stout gunny sack cloth or other stout cloth, and tag them with substantial tags which all fur buyers furnish you free of charge if you ask for them, with your name and address plainly written on the tags. It is safest, too, to put a small tag on each pelt, with your name and address upon it. Instruct the company to which you ship to hold your consignment separate until you get their grading and prices, for your acceptance or rejection. If you think the grading unfair to you or the prices too low you can either have the furs returned to you, to be shipped to some other buyer, or you can instruct the buyer to hold them for better prices if you think the market is going to be higher later on. Keep a carefully made list of all the pelts in your shipment of each different kind.

Hope I shall not lose any numbers of the paper, as we can't get along without it.—CHARLES MACEY, Cattaraugus County, N. Y.

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on November 27:

Eggs, Nearbys (cents per dozen)

	New York	Buffalo	Phila.

Long Islands dropped to \$1 bu. to the grower. 150 lb. sacks in carlots sold for as low as \$2.95 at loading point.

Maine cars were sold in bulk for \$1.65 cwt. delivered; in 150 lb. sacks, \$2.70.

States sold in bulk for \$1.50 cwt. delivered; 150 lb. sacks, \$2.30.

CASH GRAIN QUOTATIONS

Cash grain quotations were as follows on November 28:

NEW YORK—WHEAT, No. 2 red, \$1.22½. CORN, No. 2 yellow, 94c; No. 2 mixed, 92c; No. 2 white, 94c. OATS, No. 2 white, 53½c; No. 3 white, 51½ to 52c; ordinary, white clipped, 55 to 56c. RYE, 77½c. BARLEY, 75 to 80c.

CHICAGO—No. 2 red, \$1.05 to 1.05½. CORN, No. 2 yellow, 82c; No. 3 yellow, 72 to 81c. OATS, No. 2 white, 44 to 46c; No. 3 white, 43½ to 44½c. RYE, 73c. BARLEY, 61 to 65c.

CABBAGE HIGHER

Medium Danish cabbage sold in carlots as high as \$21 ton at loading point. It is practically all in storage and the shippers are not anxious to sell.

HAY MARKET FIRM

The market on hay was firm toward the latter part of the week with No. 2 bringing from \$27 to 28 per ton.

EGG PRICES SLUMP

In the last week eggs fell eight cents per doz., extra firsts bringing on November 7 55c per dozen and firsts 50c per doz. High retail prices for fancy near-by eggs has checked the demand and prices have likewise declined. The effect of lower prices has already made itself felt and on November 27 there was reported a steadier tone in the market under heavier buying.

CALVES AND VEAL

Following a sharp advance on live calves prices declined a dollar per 100 lbs. to \$13 for best quality. A stronger tendency was felt in the lamb market prices ranging from \$13 to

Avoiding Egg Losses Through Breakage

After the Eggs Are Graded, They Must Be Packed According to Size

THERE are two factors in marketing eggs that limit, possibly more than any others, the returns of the small producer, at least so far as the price received is concerned. Those factors are grading and packing, and one goes with the other. Of course, there are factors in the egg producing business that limit production, including the selection of layers, feeding rations and methods, as well as housing facilities. However, after the eggs are produced, the poultryman has these two factors facing him on the marketing end and if he is going to overcome them, he cannot allow his vigilance to slip in the slightest degree.

There is always a certain amount of pressure exerted when the cover is pressed on an egg crate. Thin shell eggs cannot stand this pressure, be it ever so slight, especially when being handled in transportation. As a result they not only cut down the results by diminishing the contents of the crate, but they reduce the value of perfect eggs in nearby through fillers. One of the best authorities on egg marketing in the United States, who has given the problem of better packing of eggs a great deal of intensive and scientific study has the following to say about egg breakage:

"The question of increased breakage of

used by shippers of large graded eggs to avoid breakage is by packing 24 dozen in a case. Long eggs mixed with small eggs are sure to be broken on the ends when packed in standard size cases that hold 30 dozen. Therefore, if you are going to eliminate breakage, the eggs must be graded and the soft shelled ones used or sold at home. They should not be shipped. Furthermore long eggs should not be mixed with soft ones. There is no question but what men who regularly ship eggs to the city market have materially increased their income by observing these two factors.—F. W. O., New York.

Unless eggs are graded for size and shape, we are bound to get a condition like this in the fillers, which clearly shows why we get so many complaints about cracked eggs.

The first factor, that of grading the eggs, is of vast importance in obtaining and holding a good market. The second factor, which blends with the first, the packing of eggs to avoid breakage in transportation, controls the returns after the eggs have been received. It is very obvious that a dealer, be he retailer or wholesaler, who receives a shipment that contains a large number of cracked eggs, will hesitate to bother with such produce where he has to pick out the damaged goods.

Naturally enough where there are a large number of cracked eggs in a case, the shipper cannot expect full payment for the consignment. But even though the shipper is willing to take a lower price, due to the damaged condition of the contents of the case, nevertheless, he will find that the dealer is reluctant to handle produce that continually comes through in an unsatisfactory condition. A case that contains cracked eggs means extra handling, disposal of "cracks" and usually smeary eggs in the remainder of the case.

The problem of proper grading of eggs is always before us. An instance was called to the writer's mind recently by a merchant of New York City who handles a large quantity of eggs in the retail trade. He purchased, for a trial, a case of eggs from Michigan. One-half the case contained nicely selected white eggs. The other half contained, in the two upper layers, a fair grade of brown eggs. However, under these two upper layers were nothing but small pullet eggs, many of which were not much larger than pigeon eggs. This dealer has blackballed the shipper of these as far as future business is concerned.

But just as important as grading is the packing of eggs to avoid breaking in transportation. The problem is not as serious as it was years ago. Commercial poultrymen are packing their eggs much better, partly as a result of better grading as to the shape of the egg and the thickness of the shell. Long eggs naturally are not accommodated to the fillers as readily as a normally shaped egg. They protrude above the filler with the result that when the cover is put on they are crushed.

eggs would undoubtedly be largely solved if the persons packing those eggs would eliminate those with very thin shells. Ordinarily it is not necessary to use a candler to determine which of the eggs will not stand shipment. If we could convince the producer or shipper of eggs that he can expect pay for only those eggs which reach market in good condition, some of the trouble would be eliminated. In our breakage tests, we have found that after we have taken out the thin shelled eggs, we get practically no breakage."

As a case appeared as it was opened. This case did not contain graded eggs. As a result the long ones were a total loss.

The standard honey combed egg filler is $2\frac{1}{2}$ inches high and $1\frac{3}{8}$ inches wide. A large proportion of the eggs that are shipped are more than $2\frac{1}{4}$ inches long. Some of them measure $2\frac{3}{4}$ inches in length. Even though these extra long eggs may have strong shells, nevertheless they will not carry safely in fillers of this size, unless they are carefully graded and evenly packed. Excelsior pads are substituted for the ordinary flats between the honey comb fillers. The size of the crate is increased in height an inch, at least by nailing strips on the sides and ends. Another method

tiveness and the sincerity of their tone, undoubtedly have induced many farmers to ship their eggs.

Work Fast, Then Disappear

One swindling dealer a short time ago rented a cellar for a month. In three weeks he had received enough eggs to retire from that location. No farmer took the trouble to write the Department of Farms and Markets asking about this man until after he had vanished. The only thing left for the Department and other agencies to do is to see that this firm does not establish itself under another name.

Attempts to drive unscrupulous concerns from the New York City markets can be successful only if farmers and shippers do their part. There is a printed list of legitimate and licensed dealers to be had from the Department. Where the shipper is determined to go outside that list he should at least write to the New York City Office, State Department of Farms and Markets, 53 Park Place, and ask it as to the reliability of the concern. When shipments are made to unknown concerns and losses result, shippers have none but themselves to blame. They are following the practices of those who bought "gold bricks" years ago.

Warm Water in Winter—A dairy cow's body is more than half water. It is evident that in order to produce a large amount of milk she must have an ample supply of pure drinking water. It should not be ice cold during the winter time, since it will require feed to warm the water and dairy feeds are expensive fuel substances.

How breakage may be avoided. Note how the depth of the case has been affected by including a 1 x 2 inch strip under the cover.

The Modern Woman Writes the Modern Way

MOTHER is just as up-to-date as the rest of her family! When it comes to sending to the city for things her family needs she *types* her order quickly and clearly on the Underwood Portable, and her goods come through with never a mistake. She's sure of this, because she checks the goods against the carbon copy of her order.

The Underwood Portable saves time and work on all the writing done at home,—business and personal letters, recipes, extracts from

magazines, and orders for supplies from far away.

Young people at school who form the habit of typewriting lessons, essays, etc., are bound to win favorable attention from their instructors. What is more, in acquiring a knowledge of typewriting they have gained something that will be valuable to them for many years to come.

It is easy—in fact it's fun—to write on this compact, sturdy little typewriter. Typewriting is quickly learned on this machine—a few hours will make anyone reasonably proficient.

UNDERWOOD TYPEWRITER CO., INC., Underwood Building, New York City

UNDERWOOD PORTABLE

PRICE, \$50

The Cooperative Play

The Mythical Meetings of a Mythical Board—Act 3

THIS is the third act of the play, "Is Cooperative Marketing Here to Stay?" By THE SILENT DIRECTOR

If you read one of these acts, be sure to read all of them, because the series covers the progress of a mythical board from its organization, through its early troublesome days up to the time when it begins to operate as a real business organization.

The Me-too Director

looks helplessly at the Director-Who-Plays-Politics. The Fat Director's eyes begin to twinkle as he recalls the sudden disappearance from the room in the early part of the meeting, of the Me-too Director and the Politician and their return with the Suspicious Director.

Fat Director: Well, he is probably as much of a farmer as some of the rest of us. How about it? (turning to the Director-Who-Plays-Politics).

Director-Who-Plays-Politics: Oh, he's a farmer all right.

Business-like Director: Oh, you know him, do you? Tell us about him.

Director-Who-Plays-Politics: He's a darn fine fellow!

Business-like Director: Is he a successful farmer?

Director-Who-Plays-Politics: Well, he has some money.

Secretary: How did he make it?

Me-too Director: in response to appealing glance from *Director-Who-Plays-Politics:* Guess he must have made it farming.

At this point the *Fat Director* gets to his feet. His pleasant face has hardened. He obviously is mad through and through: Mr. President, he shrills, pointing a shaking forefinger at the *Director-Who-Plays-Politics* across the table; Mr. President, this thing has gone far enough. I know John Asbury. I went to school with him. He never made a dollar in his life. His father left him money. He has lost most of it. I wouldn't trust him with the management of a dollar of mine. He is a good fellow, yes, if you are looking for a clever companion or a boy who'll play the game with you, but as a business man he's a joke. There's a deal on to put him on this board. I want the rest of you to know it. We don't want him. We want a man here who can manage his own affairs well; one who has made his own money; one whose judgment is worth something; and above all we want a man to come onto this board who represents his district. Not one who is landed here by an inside deal.

Business-like Director: I move that the election of a director to fill the vacancy now existing be deferred until the next meeting of the board.

Director-Who-Doesn't-Smoke: Second the motion.

The President puts the question. It is carried.

Fat Director: I move that the Secretary call a meeting of farmers in the district where the vacancy exists and that our President go there and tell them of the kind of a man we need on this board.

All nod their heads except the *Director-Who-Plays-Politics* and the *Suspicious Director*. They glower at the *Fat Director* with mingled rage and admiration. He merely grins and lights another cigar.

President: So ordered.

Secretary: Our attorney desires to present a matter to the board.

President: Tell him to come in.

When wire fence lasts

only a few years the fault is in the WIRE ITSELF. Galvanizing helps prolong its life, but the right kind of wire will last twice as long. This new discovery should interest every fence user. Write today.

Act 3—The March Meeting of the Board

In which the board replaces the Always Absent Director. The *Fat Director* shows his mettle.

The scene is the new director's room, a rectangular, well-lighted room with a long table in the center. Chairs are placed at the table and at each place is a large blotter, a supply of blank paper, pencils, a program of the meeting and two typewritten reports. One shows the financial condition of the cooperative as of February 28. The other analyzes activities for the month of February.

The *Director-Who-Plays-Politics*, the *Me-too Director* and the *Fat Director* enter the room.

Director-Who-Plays-Politics: I hear that our friend who never comes to the meetings has resigned.

Me-too Director: That so?

Fat Director: Well, from what I know it wasn't altogether voluntary on his part.

Director-Who-Plays-Politics: What do you know about it anyway?

The *Fat Director* looks carefully around, then pulls his companions over to the corner and lowers his voice: Well, Miss Bower, the telephone girl, tells me that the President called him up and asked him if he was going to come to this meeting and when he said he didn't know, the President gave him an awful peeling.

The *Director-Who-Plays-Politics* grows thoughtful. Presently he signals the *Me-too Director* and quietly leaves the room. As the two men go out the President, Secretary and *Business-like Director* enter.

President: Yes, I told him that he had a responsibility to meet and that if he didn't care to assume it, he had better make way for some one who would.

Business-like Director: You did the right thing.

Secretary: Have you in mind a successor?

President: No. It is up to the board to elect his successor and I think the best way will be for us to discuss very frankly the men who are available and to choose the best one in sight.

Business-like Director: Quite right.

The *Director-Who-Plays-Politics* enters with the *Me-too Director* and the *Suspicious Director*. The other Directors are now all present except the *Fat Director*.

President: Be seated, gentlemen, and come to order.

The Secretary notes the absence of the *Fat Director* and whispers to the President who smiles. At this point the *Fat Director* enters beaming. He smiles and nods to all present, pulls out a fat cigar and settles himself comfortably in his chair.

President: Our secretary is to be commended on the new arrangements for our meeting.

Business-like Director: I like particularly the written reports. I wish we might have them for study in advance of our meetings, however.

Secretary: I think I can arrange to do it.

The session begins. The roll is called, and the typewritten treasurer's report examined and adopted.

President: Before we go any further, I would like our Secretary to read a communication to the board.

The Secretary reads the resignation of the *Always-Absent Director*.

Business-like Director: Move it be adopted.

Suspicious Director: Second the motion.

The *Fat Director* starts to open his mouth but the President puts the question.

All vote "Yes" but the *Fat Director* who does not vote.

President: What will you do about a successor?

Business-like Director: Who is eligible?

Secretary: Any member living in the resigned director's district.

Business-like Director: Who are some of our strong members there?

The *Director-Who-Plays-Politics* looks anxious and reaches under the table to kick the *Me-too Director*.

Me-too Director: John Asbury is an awfully good man.

Suspicious Director: I think so, too.

President: Do you know him personally?

Suspicious Director: No, but I hear him well-spoken of.

Secretary: Is he a farmer?

Get Winter Eggs!

See to it that there is song and cackle, scratch and action, going on in your poultry yard.

That's when the eggs come.

Feed

Dr. Hess Poultry

PAN-A-CE-A

See them get busy. It gives hens pep.

Nux Vomica is what does it—that greatest of all nerve tonics. A Pan-a-ce-a hen can't hold still. It's her good feeling that makes her hop around.

Pan-a-ce-a has Quassia in it to make hens hungry. Great combination! One makes them eat—the other helps them digest what they eat.

No dormant egg organs when that combination gets to work on a hen's system. You just get eggs—eggs.

A Pan-a-ce-a hen is always a hungry hen—an industrious hen. She gets off the roost winter mornings, ready to scratch for her breakfast.

Tell your dealer how many hens you have. There's a right-size package for every flock.
100 hens, the 12-lb. pkg. 200 hens, the 25-lb. pail
60 hens, the 5-lb. pkg. 500 hens, the 100-lb. drum
For fewer hens, there is a smaller package.

Hay shortage on your farm?

Buy NOW for Winter and Spring Supply

Despite shortage of hay and corn silage you can keep up milk production. Here is a feeding plan that will do it. Experiment stations and careful investigation prove it.

Use DRIED BEET PULP Instead of hay or corn silage

In tests, 6 pounds of Dried Beet Pulp have replaced 10 pounds of mixed hay. It costs no more and increases milk yields 2 to 5 pounds a day. In other tests 1 pound of Dried Beet Pulp replaced 5 pounds of corn silage. It produced 10% more milk and improved health of cows. There is big economy and profit in feeding Dried Beet Pulp. It is the *Sugar Beet*, dried, after the extraction of the sugar. It is a succulent, palatable, nutritious and wholesome vegetable feed.

Why Is a Feed Manufacturer?

A Wednesday Evening Radio Talk Broadcast from WEAf

By SEARLE MOWAT

THE Editor of AMERICAN AGRICULTURIST has invited me to talk to you about a very important subject. It is so important that I made a trip from Detroit to New York City—hopeful that I may, in the ten minutes allotted to me, say something that will help to bring three separate groups of people a little more closely together. These three groups are the city dwellers, the farmers and the feed manufacturers.

My subject has to do with cows, dairy feed and the dairy business in general. Therefore, those of you who do not own and milk cows have an interval in which, if you like, you can go and fix the fire or see what the baby is doing.

I hope, however, that you will listen instead, for we manufacturers who prepare the raw material out of which cows make the milk that will be on your doorstep tomorrow morning—and our farmer and dairyman friends—feel that you and we are not well enough acquainted.

If we all ate more dairy products we would be a lot healthier, and we would get more actual value in return for each dollar we spend for food. America needs to be brought back to the dairy cow. Five other nations consume more whole milk per capita than we do. We are fifth in per capita consumption of butter and tenth in per capita cheese consumption.

But some day we are going to be on top. That gets me right up to rubbing elbows with the main point of my remarks, for I want to tell you what the feed manufacturer is doing to help put Uncle Sam at the head of the dairy list. We have undertaken a tremendous task. We prepare the food of millions of cows all over the United States and some of us are doing it for foreign countries, too. From the cotton fields of Texas, the wheat fields of the northwest, the sugar-beet farms of the middle west, the flax fields of Minnesota, Montana and South America come the grains from which the by-products—the cottonseed meal, the bran, middlings, corn gluten, dried beet pulp, and the linseed oil meal which the feed manufacturer must process and combine into food for cows. It was not until we got to doing this for thousands upon thousands of herds that we realized how big a job it is to make feed for just one herd or one cow.

Years ago, before there were any feed plants, the dairyman drove to his grist mill, bought a few sacks of bran, cottonseed meal and whatever other things he thought he ought to feed his cows and took them all home with him. Then he poured out the sacks on the barn floor and mixed them

all together according to his particular formula, if he had one. Each batch was entirely different from the other.

Some of you think we do substantially the same thing in our feed plants—that we are just "feed mixers." The fact is that if a good dairy ration *could* be put together by these simple methods there would be no place for the feed manufacturer. However, it cannot—the feed manufacturer is not just a "feed mixer," by any means. He is a scientist—a chemist—something of a veterinarian—an expert in nutrition—an expert grain buyer—

him of any changes that are made in the formula and that none will be made until many months and even years of experiments and tests have proven them to be right and proper.

So much for the formula. Now let's talk about the manufacturing processes. The feed manufacturer buys thousands of tons of each of the various ingredients he uses and for that reason he must be absolutely sure that he gets good ones. He cannot guess at their quality. He must *know*, for cows are just as fussy about the quality of their food as human beings are. For example, when a carload of bran reaches his plant the manufacturer sends out his chemist to take

samples of various parts of the car and bring them to the laboratory for analysis. The chemist must test those samples for moisture, fat, fiber, acidity, ash, protein—a whole list of things that are mighty important to cows, and which few people but chemists know anything about. This applies to every other ingredient as well. Each one of the scores and hundreds of carloads must be tested in exactly the same way.

If he finds the car in good condition and up to a certain fixed standard of quality it is then unloaded. It cannot be dumped into one pile, however. It must be scattered over a large surface and mixed with other carloads of bran

in the storehouses and then again in special tanks higher than a 3-story building. Thus the bran as it finally goes into the feed is what you might call a "blend" of scores of carloads of bran, each one made by Mother Nature just a little bit different from the others, but all toning down to an unchanging blend as it goes to be mixed with the other ingredients. This is done, not just with bran alone, but with each separate ingredient, in order to provide the dairy cow with an unvarying ration of the same quality and nutritive value.

Then these ingredients have to be carefully proportioned, so that there is not more bran or more cottonseed meal in one lot of the finished product than in another. The percentage of each ingredient must be kept exactly the same or the cow that eats it will notice the difference and so will the man who milks her. These apparently slight changes in the quality of each ingredient may easily throw a cow off feed and cause her owner a serious loss of milk, for once "off her feed" it is practically impossible to bring her back in production until after she has another calf.

But there is still another big job in making a dairy ration. No matter where the bran, the

A fleet of lake vessels in the harbor of Buffalo loaded with grain for our eastern dairy cows. Each vessel has a capacity of from 300,000 to 500,000 bushels of wheat

an engineer—and a practical dairyman too. That is to say, a modern feed manufacturer must have and use the service of men who know all these things.

In the first place he must have a correct formula. He must have a recipe for making feed and one which actual tests have proved to be exactly right. He has to have cows and a dairy farm of his own and keep trying out his ration day in and day out, as a daily check on its merit. Then he has to be trying out new formulas, new ingredients, new ideas of all kinds, constantly trying to find some way to improve his formula—some way to give his customers something better than what now seems to be the best.

Thoughtful feeders of dairy cattle select a brand of dairy feed which they have found by actual tests to be uniformly balanced and best in every way for the cow's health and production. Furthermore, it must be made by a feed manufacturer in whom they have confidence. They stick to this ration, feeding it year after year, because they know it should not be changed, until still further tests have proven some other formula to be still better. But these changes the thoughtful feeder leaves to the manufacturer, confident that the latter will notify

VOL. 112 December 15, 1923 No. 24

The Unfortunate Milk Situation

ON October 24, the Board of Directors of the Dairymen's League Cooperative Association set the price for November Class I or fluid milk at \$3.45 per hundred pounds. On November 12, a special meeting of the League Board of Directors reduced the price 65c per hundred, or from \$3.45 to \$2.80. Later, the December price was also set at \$2.80.

Previous to the League reduction, the Sheffield Farms Company demanded, or the Sheffield Farms producers voluntarily made, a reduction to \$3.05 for November milk, which was 40c a hundred pounds under the first price of \$3.45 set by the League. This evidently started the price cutting, for the League felt that it could not maintain its own market while there was a large volume of other milk coming into the market at a figure so much lower.

Not to be outdone in the merry game of selling the farmers' milk at the lowest possible price, as soon as the League reduced its price, the Sheffield Farms made another cut to \$2.58, or 22c under the present League price of \$2.80. At the same time, the companies reduced the price to the consumer in the city one cent a quart. But, as is generally the case, the consumer did not get the full benefit of the 65c reduction to farmers.

Although considerable energy is being wasted by both the poolers and non-poolers in trying to put the blame for this unfortunate situation upon each other, neither party has emphasized one of the chief causes of the whole trouble, which is TOO MUCH MILK.

During the month of September, 1921, there was received a daily average in New York City in whole milk, cream and condensed milk the equivalent of 3,792,480 quarts. In September, 1922, this daily average had grown to 3,872,280 quarts; and in September 1923, we shipped into New York City the equivalent of 4,119,120 quarts of milk per day. During the first ten months of 1923, the increases over the same period of 1922 are 1,431,723 forty-quart cans of milk and 24,934 forty-quart cans of cream.

If dairymen insist in crowding the last possible

pound of grain into their cows and constantly keeping cows that never have and never will pay their costs of production, it can have but one effect upon the milk market, and that is to lower prices. But even with this oversupplied market, the price might have been maintained at this time of the year when the retail price of milk is always high if the producers and their organizations had worked together and applied just a few elementary principles of cooperation. This is the time for plain speaking. The utterly foolish and terrifically expensive warfare among the producers themselves and their organizations is costing dairymen of this section millions of dollars.

The League is probably right when it asserts that it was forced to reduce its price in order to meet the competition of producers not in the organization. But if it made its reduction in order to take a whack at the non-poolers, the action was, in our opinion, absolutely wrong. The fundamental duty of the League or any other organization of farmers is to sell the milk of its members for every cent that can be extracted out of the market for it. It may be hard for a pooler to feel that he is helping to hold the umbrella over his non-pooler neighbor, but he should not forget that when he lowers the umbrella to spite his neighbor, he also lets the rain in on his own head.

Nor do we hold any brief for those producers who first lowered the price. It does not matter who started it; it is all a costly foolish business, and all a result of an absurd situation which exists here in the East, particularly in New York State, to which AMERICAN AGRICULTURIST has called attention several times. There are at least four milk producers' organizations, including the Dairymen's League Cooperative Association, Sheffield Producers, the Eastern States Milk Producers and the Non-pool Organization, all working independently of each other and at cross-purposes, each group meeting the organized dealers separately and each trying to set its own price entirely irrespective of all the other milk coming into the city.

No one of these groups has anywhere near the majority of the milk. No one group can control the situation. The result is chaos in the market and it will continue to be chaos until some kind of a working scheme of federation and cooperation among the milk organizations is developed. Is it not time that dairymen insisted upon a little cooperation that really cooperates?

The President's Message

THE long-awaited and eagerly expected first message of President Coolidge, "The Silent President," was delivered to the joint session of Congress at 12:30 P. M. on Thursday, December 6th. When the President had finished reading his message, no one could have any doubt as to his position on practically all of the leading national and international problems which now confront the country. Briefly summarized, his position on some of these outstanding problems was stated as follows:

TAX REDUCTION. "It is possible to make a large reduction in the taxes of the people. I have no hesitation in declaring this to be paramount. . . . A proposed plan has been presented by the Secretary of the Treasury which has my unqualified approval."

BONUS. "Rehabilitation and vocational training must be completed. . . . I do not favor the granting of the bonus."

AGRICULTURE. "No complicated scheme of relief, no plan of government fixing of price, no resort to the public treasury will be of any permanent value in establishing agriculture. Simple and direct methods put into operation by the farmer himself are the only real sources for restoration."

"Indirectly, the farmers must be relieved by a reduction of national and local taxation. He must be assisted by the reorganization of the freight rate structure which would reduce charges on his products. To make this fully effective, there ought to be railroad consolidations. Cheaper fertilizers must be provided."

LEAGUE OF NATIONS AND WORLD COURT. The President made it clear that he did not favor our country joining in the League of Nations, but that he did favor the establishment of a World Court.

IMMIGRATION. "It is necessary to continue a pol-

icy of restricted immigration. America must be kept American."

PROHIBITION. "It is my duty to enforce the laws. It is the duty of a citizen not only to observe the law, but to let it be known that he is opposed to its violation."

FOREIGN DEBTS. "Financial obligations between nations are moral obligations."

ARMY AND NAVY. "Both of these services should be strengthened."

RUSSIA. "We will enter no relation with another regime which refuses to recognize the sanctity of international obligations."

SHIPPING. "Government-owned merchant marines should be transferred as soon as possible to private ownership."

Eastman's Chestnuts

ON one of the registration days this fall I stood in line waiting the chance to tell all of my personal history so that Uncle Sam would let me vote. Ahead of me in line was a lady whom the registration clerk was asking the long list of questions.

"What is your age?" he asked.

"Thirty-two," she replied.

"Thunder," whispered the man behind me, "if that old maid sees forty again, I'll eat my hat."

Maybe he was right, but my sympathy was with the lady. If she gets any pleasure out of sticking around thirty-two for the rest of her years, why, I say it is nobody's business but her own.

Times have changed. An old maid is no longer an old maid. After the Civil War, and the excitement of Gettysburg, Winchester, Petersburg and a hundred other fights, thousands of boys could not reconcile themselves to the monotonous hand work of the lonesome hill farms in the East. So many of them went to the cities and many others opened the great West.

But the girls of the eastern farms were left behind. Only the good Lord will ever know the tragedy of loneliness and heartache of those many thousands of country girls whose chances for a natural happy married life went glimmering when the boys went to the war or to the West. And the worst of it was, all they could do was to patiently endure with a meek attitude of folded hands even to the extent of being more or less pitied or ridiculed as an "old maid."

Today it is different, and I for one am glad of it. Women have learned to take their place in the world's work as never before and a real old maid is as scarce as a Dodo. Not that there are not a lot of unmarried women, but they have learned how to keep themselves young in spirit at least, and how to take part in the world affairs as a normal human being until finally along comes a man they think they can boss in double harness without his knowing it. Then they set about to make him propose.

One such, of no uncertain years, was riding recently on a western train when it was held up by two robbers. One of them was a tall, handsome fellow and the other much shorter and not very good looking.

"Now," said the tall robber, "we'll rob all of the men and kiss all of the ladies."

"Naw," said the short fellow, "we'll rob the men all right, but we'll leave the women strictly alone."

"You shut up," said the maiden lady, who had overheard the conversation, "that tall man is running this train robbery!"

The United States Department of Agriculture in a recent report stated that eight or ten billions of dollars must go into the renewal of equipment on farms in the next ten years. Since the war the farm people have been getting along with as little equipment as possible. They have patched up the fences and repaired the farm machinery so far as they could themselves. This practice cannot be carried on indefinitely. New material must soon replace much worn beyond repair. Therefore, one of the first evidences of the farmer's return to moderate prosperity will be increased purchases of farm machinery and supplies. This is made all the more necessary by the great shortage of labor which necessitates the use of a machine in every possible place where it is at all practical.

"Dollar Makers and Savers"

From Doing "Home Barbering" To Capturing and Taming Wild Bees

ONE way by which I have been saving dollars for several years is by doing the home barber work. The necessary tools are paid for by saving a few visits to the barber. Besides the money there is quite a valuable saving in time. There are few home barbers because people are afraid to try it. It is not difficult as most people think to do a fairly good job. One thing only is really necessary, a sharp pair of shears. A pair of clippers is handy. —Mrs. E. M. C., New York.

* * *

COUNTRY DINNERS FOR CITY FOLKS

DURING autumn and winter I make extra dollars serving chicken suppers to city folks. We live seven miles from town, but they come in autos. My daughter works in a large department store and the clerks are always ready for an outing and a good meal. I served the first one more as an accommodation. They were so well pleased that they wanted more suppers and told their friends about it. So there is always a bunch waiting their turn to come. They pay me a dollar a plate. I take twenty at one time and have two tables with ten at each table, seating them all at once. I don't attempt much style, putting everything on the table at once except the dessert. I cook four good sized chickens which gives two helpings to each one if they wish that much. Sometimes I serve waffles, sometimes noodles and sometimes biscuits and always mashed potatoes and other vegetables in season. My married daughter helps me serve and I pay her. I make more out of my poultry than if I sent them to market and it is work that I like to do. —Mrs. T. G., Pennsylvania.

* * *

GOOD CLOTHES FROM FLOUR SACKS

I HAVE saved several dollars by making clothing from cotton grain bags, also one half barrel flour sacks. I have had fine success with a soap dye I bought in our local store. When dyed and pressed nice and smooth, they are just as good as new cloth bought from the store and very durable. I make the clothing on the wrong side of the cloth so that the lettering will not show as it takes much time and strength to remove the letters.

Last year I received \$1.00 special prize from our grange fair for a blouse and bloomer suit dyed navy blue that I made for my thirteen year old daughter. The bloomers were regular gymnasium pattern and took nearly all of two bags. The middy took a little over one bag. Big sister was much pleased with the suit, so I made her another pair of bloomers this fall, dyeing them brown.

They are much warmer than petticoats, even if one wants to wear a skirt over them. I've also made two dresses for myself from bags, one dyed navy blue, for which I received a blue ribbon. One can think of numberless uses for the dyed bags. —Mrs. L. F. E., Massachusetts.

* * *

"A PENNY SAVED IS A PENNY EARNED"

MY greatest dollar maker is the farm account book which I am keeping. I find that both my husband and myself are often kept from making unnecessary expenditures when we realize that it will all appear in black and white in our list of disbursements. On the other hand, we are daily impressed with the importance of turning everything we possibly can into cash, so as to swell the column of receipts. Our accounts are a

great incentive to industry and economy and prove to us conclusively that "A penny saved is a penny earned." —Mrs. R. D. C., New York.

* * *

HANGING FOR MONEY

I HAVE saved a great many dollars by hanging the wall paper in my home. Any woman who can climb or look upwards without becoming dizzy can do the work with very little practice and the only instructions needed can be found in the wall paper catalog issued by any reliable mail order house. By the way, these same mail order concerns are another saver of dollars. It will pay you to equip yourself with all the tools necessary to make the work easier. You can turn the

How Is This For a Dollar Maker?

work into a dollar maker either by papering your neighbor's rooms or acting as assistant to another. Buy cheap paper and experiment on an unimportant room, having enough extra so that you can occasionally wad up a refractory length and jump on it to register your annoyance. By the time you have one room finished you can do the work as well as many "professionals." —Miss A. S., Pennsylvania.

* * *

DOES HE PUT SALT ON THEIR TAILS?

THERE is good profit in bees. I am employed on a farm in Princeton, N. J. Being an expert at bees, I capture all the wild bees in the neighborhood, change them to pure Italian and get from 200 to 300 pounds of pure honey for each hive in one season and then sell it at the rate of 40c per pound. —A. S.

* * *

USE A. A. RUG-MAKING HINT

I HAD some old bunting which had been spoiled by being out in the rain. I had put it away thinking I could crochet a rug as soon as I got time. Last year, AMERICAN AGRICULTURIST printed an article on rug making and said to send

6 cents for full directions. I got directions and colored my bunting and made my rug. This fall I took it to our county fair and got first premium and when I took my rug I also took some other crocheted articles and got several dollars in premiums. Wasn't that a nice easy way to make some extra money? —J. C. F., Ohio.

* * *

"A NAIL IN TIME SAVES SHOES"

I SAVE from \$5 to \$10 a year by repairing shoes. There is only one native cobbler near here, so we must do it ourselves. "A stitch in time saves nine." So if I notice a tap (sole) coming off, I nail it on at once. Then in the evening I get out the last, hammer, nails and leather and go at it. A shoe mended in time will wear twice as long. —W. D. A., New York.

* * *

TANNED HIS HIDE

LAST winter I saved many dollars in an over-coat, by sending a horse hide to one of the well known tanning companies to be made into a coat. I could not buy a coat for less than \$30. The fur coat cost me \$26 and I had a far better coat than I could buy for the above price. —K. P. E., New York.

* * *

WHEN THE DAY'S WORK IS DONE

FATHER and I save many dollars by keeping our farm machinery and tools under cover. When our day's work is done, we put our equipment in the barn or shed so it is not worn out by the weather, and the dollars thus saved are beyond estimate. —W. S. C., New York.

* * *

SELLS EARLY VEGETABLE PLANTS

EVERY year I make a small hot bed by using four storm windows and sell plants to the neighbors. —R. J. M., New York.

* * *

ANOTHER ROADSIDE MARKET STUNT

HERE is my dollar maker and it makes many dollars for me through the year and the time, labor and produce is scarcely missed. We live where many automobiles pass and I put out anything which I happen to have which would appeal to those who like good things to eat. It is surprising how quickly it is picked up and always at a fair price. Jelly, cottage cheese, milk, cream, apples, peaches, pears, canned fruits and canned vegetables find a quick and easy market. It seems to me that almost any farm woman might do this. I sometimes pay neighbor children for picking berries on our own place and sell them on the market at a profit. Children are happy, berries are saved and patrons think themselves lucky to get the fresh berries. —L. K. G., Rhode Island.

* * *

SELLS WILD HORSE RADISH

MOST farms have horse radish growing wild. Dig this any time before the ground freezes and place it in a barrel with moist earth. After the holidays wash the roots and run through a sausage grinder, using the fine plate. Bottle in large mouthed bottles. I purchased pint bottles for the purpose and collected them when I made the second call. We sold \$25 worth one year. I did the selling while in town getting the team hauled or when other business took me to town. —A. K., New York.

20¢ to 40¢ More for Milk

How Purina Service Cuts Milk Costs

20¢ to 40¢ per Hundred

THREE hundred trained Purina Field Service Men are daily helping dairymen use their home-grown feeds to increase their milk profits. The service of these men is free.

There's one of the Service Men in your section, who thoroughly understands your local feeding problems.

He'll help you figure out a ration that will cut your cost of milk production—a ration made principally of your home-grown feed. And this man's job will not be complete until your cows are actually producing more milk at less cost per pound.

Tell your feed dealer today when you want the Purina Service Man to call. Mail the attached coupon to Purina Mills. It will bring you a free copy of the 100-page illustrated edition of the 1924 Purina Cow Book, and complete information about free Purina Service.

How Much Money Do Farmers Make?

HOW do you figure the profit or loss on your farm? What income does the average farmer make? What income should we expect to make on a farm in order to feel that we are farming successfully?

Before we can answer the last two questions we need to agree upon a uniform way of figuring farmers' profits or losses. In the past fifteen years the term *labor income* has come into general use as a means of expressing farmers' profits.

What is Labor Income?

This is the way to compute your labor income. First, list all your farm sales for the year and add them together. This will include the sales of milk, eggs, crops, animals, etc. Suppose that your total sales for 1922 were \$4,000.00. Now list all your farm expenses for the year. Include expenses for labor, fertilizer, feed, taxes, repairs on machinery, threshing, silo filling, and all other business expenses. Do not include personal expenses such as groceries, clothing and fuel. Suppose that these cash farm expenses amount to \$2,500.00. Then the difference between the receipts and expenses is \$4,000.00 minus \$2,500.00 or \$1,500.00. This may be called the farm income.

This \$1,500.00 income has been earned by two things, the labor of the farmer and his family and the farmer's capital. Every farmer is a combination of capitalist and laborer. The average New York State farmer has a capital investment of nearly \$10,000.00. If your property was worth \$10,000.00 then this capital alone without any help from you should earn 6 per cent. interest or \$600.00 of the \$1,500.00 farm income. Subtracting this \$600.00 from \$1,500.00, the remaining \$900.00 was earned by the labor which you did and the labor of your family on the farm.

How Labor Income is Figured

Average farm capital	\$10,000.00
Total receipts for year	4,000.00
Total expenses for year	2,500.00
Difference between receipts and expenses or farm income	1,500.00
Interest on capital at 6 per cent.	600.00
Subtracting interest from farm income gives income received for your labor and any farm work done by members of your family	900.00
Estimated value of farm work done by members of family	150.00
Labor income of farmer alone	\$ 750.00

This explanation covers just the high spots of the method of figuring labor income. Many other adjustments must be made. The capital should be figured for the beginning and the end of the year. A gain in capital is treated as a receipt. A loss in capital is treated as an expense.

If the farmer has family labor which helps with the farm work but does not receive regular wages the value of this labor is estimated and subtracted in order to get the labor income of the farmer alone.

In this method of figuring, no attempt is made to place a value on the living which a farmer obtains from the farm. In addition to labor income the farmer receives house rent, milk, eggs, vegetables, and various other things from the farm. There is no easy way of making a comparison between labor income of farmers and city incomes. In order to make such a comparison one must know which city is being compared; what occupation in that city the particular farmer would follow, the size of the farmer's family and various other factors. Labor income is chiefly used to make comparisons between the incomes of farmers, in order to find out how successful is the farmer's business and why some farm businesses pay better than others.

How Large a Labor Income Does the Average Farmer Make?

The State College of Agriculture at Cornell has financial records on about 8,000 farms. Before the war the average New York State farmer made from \$400.00 to \$600.00 labor income varying somewhat with different regions of the State.

In 1907 the farmers in several townships of Tompkins County made an average labor income of \$423.00. In 1909 the farmers of several townships in Livingston County averaged \$666.00. In 1910 the farmers of several townships in Jefferson County averaged \$609.00. In the very severe depression following the war farmers in many cases made a minus labor income or failed to make interest and received nothing for their labor.

In one of the best dairy sections of Chenango County the farmers in 1921 made a labor income of—\$178.00. If you consider that their capital should have earned 6 per cent. then these farmers worked the whole year for nothing and lacked \$178.00 of making interest on their capital.

Fortunately the prices of New York State (Continued on page 417)

Farm Survey Analyzed

JOHN J. BIRCH

THE United States Department of Agriculture, together with the New York State College of Agriculture of Cornell University, have just concluded a survey of farming conditions in Livingston County, New York. This area was chosen because as they said: "There the conditions are typical of moderately successful general farming with a large assortment of crops."

It is understood that a number of similar surveys are to be made in various parts of the country in an effort to determine whether or not farmers are getting adequate returns for their produce and to compare the living conditions in various parts of the whole United States.

This survey covered 402 farms having an average size of 131 acres and representing about 14% of the total number in the county. Of these 402 farmers, 295 were owners and 107 tenants, either paying a money rent or working on shares.

The following is a tabulation of the findings:

Expenditure by the average family (12 mo.)	\$2,012
Of this expenditure	
for food	39.5%
for clothing	13.8%
for health maintenance	4.1%
for education	15.9%
for personal items	0.5%
Average value of the farm home	\$2,340
Those having water in the house	19.8%
Those having gas or electricity in the house	24.6%
Average value of the home furnishings	\$822
Families owning cars	75.6%
Average cost of operating car	\$65.00
Families with children over 18 years old	165
Per cent. of these 165 with children high school graduates	30.3
Families with children old enough for college	92
Per cent. of these 92 with children in college	29.4
Fathers or mothers attending school beyond the 8th grade	45.8%
Fathers attending one year or more of college	2.5%
Those having telephones	75.0%
Average expenditure for travel	\$12.00
Average expenditure for clothing per family	\$277.00
Homes containing books and magazines	most
Homes containing musical instruments	most

CHENANGO COUNTY FARM BUREAU HOLDS ANNUAL MEETING

H. H. LYON

CHENANGO County, N. Y., has a live farm bureau. As is usual every personal call, the number seen each day, the number at meetings and reached by speakers, telephone calls and telegrams are all counted. It makes a big counting by the end of the year. Last year these averaged to cost 21 cents a contact. This year by better planning the number has been increased by over 50 per cent. and the cost has dropped to 12 cents each as an average. In the publication of the County Bureau News the advertising has a little more than equaled the cost of the publication.

This county is not one of the nine in the State in which the county pays a veterinarian for testing for tuberculosis. We are running the tests strongly just the same and it is on the presumption that it is for the benefit of the individual rather than the public it would seem.

Direct Interest in Potato and Cabbage Cooperatives

The chief project in cooperation that the county bureau can help about is believed to be in relation to the reorganization of the State potato and cabbage association. This is something in which this county is considerably interested. We are interested in the State federation of farm bureaus for it was stated that we are likely to pay to that federation a thousand dollars by the close of the year. We should try to make the federation work for us as a county to make that payment avail us something. We have lands that may as well go for foresting and it is possible that the federation can assist in forming a policy that will bring the foresting projects to the benefit of the county. Forestation may be investing something that gives us no return for some time but in thirty or forty years it may be made to return in a revenue to the county.

The problem of the farm bureau as manager Fogg sees it, is to get every member interested in something in a special way. Teachers think it some job to get fifty pupils interested. One wonders how one little man can get eight hundred or a thousand individuals really taking an interest in some line of improvement.

Dr. Warren Addresses Meeting

Dr. Warren suggested that it may be possible to grow more of our own foods on the farm and more of the feeds for the cows. That may seem strange advice for these times because farmers have more than they can do already. It probably means that dairymen may find it possible to produce more feeds by keeping fewer cows and better ones. Corn can be

(Continued on page 416)

About Farm Machines and the McCormick-Deering Line

THE U. S. Department of Agriculture has shown that farm equipment is one of the smallest items in the cost of farming, the yearly average being only 4 to 8% of the total.

Farm machines are sold for less money, pound for pound and quality for quality, than any other similar manufactured article. Yet in profitable farming there is nothing more important than good equipment.

Check the cost of your farm machines against the rest of your investment — land, buildings, labor, live stock, etc. — and your figures will probably agree with the average.

Now is a good time to inspect the condition of your machines. Most of them have been used lately. Are any of them worn out? Are some of them so out of date that it does not pay to use them? Are there new methods on the market you should be adopting? Have you been getting along without certain

machines that would save you money and labor?

To help you take an inventory of your needs, we are printing the full McCormick-Deering line.

The purpose of all McCormick-Deering machines is to make farming better, easier, and more profitable for their owners. They are all useful, modern, and efficient. The Harvester Company's work of standardization has simplified the variety of lines, combining many good features in fewer essential machines. Power farming is at its best where McCormick-Deering Tractors [15-30 and 10-20] are used with McCormick-Deering machines for draw-bar and belt work. They are made to work together.

We will send you descriptive material, catalogs, details as to sizes and styles on any machine or line that may need attention on your farm. Write the address below. Call on the McCormick-Deering dealer; he will always be at your service.

10% More Milk Will Double The Profit from Your Cows

You do not expect bumper crops from your fields without fertilizing and extensive cultivation. Why, then, expect a maximum milk yield from your cows unless you keep their milk-making organs in top-notch health? The hard-worked milk-producing functions of the cow need frequent aid to keep up a full flow and retain the stamina to resist disease.

Kow-Kare has such positive action on the digestive and genital organs that its benefit is soon shown in the milk yield. Thousands of successful dairymen are now using it regularly about one week in each month for every cow. Especially during the winter months it aids in keeping up a full yield from dry rough feeds.

Dairy authorities say that the average dairy can double the net profit if measures can be found to increase the milk 10%. Kow-Kare is a regular part of the feeding course in thousands of dairies where surprising increases in milk yield are being accomplished.

Kow-Kare, of course, is primarily a cow medicine. It increases milk flow only because it builds up the same set of organs that must be reached when cow diseases are being treated.

Such troubles as Barrenness, Abortion, Retained Afterbirth, Scours, Bunches, Milk Fever, Lost Appetite can be successfully eliminated by Kow-Kare because it restores health to the genital and digestive organs.

There is a definite profit advantage for every user of Kow-Kare. Cow health and big milk yields are inseparable. Our free book, "The Home Cow Doctor," is yours for the asking. It tells the various uses of Kow-Kare, with which every cow owner should be familiar.

Feed dealers, general stores and druggists sell Kow-Kare, \$1.25 and 65c sizes. If dealer is not supplied, order direct. We pay postage.

Among New York Farmers

THE directors and representatives of the local associations affiliated with the Western New York Fruit Growers' Cooperative Packing Association, Inc., met on November 28 in Rochester to discuss plans for the future. These plans mainly had to do with expansion and contracts. The contract now in force is good for one year and the proposition is to extend it to a five-year contract.

The greater part of the morning session was taken up by Walter Peteet, head of the Division of Cooperative Marketing of the American Farm Bureau Federation. Mr. Peteet has had considerable experience with farmers' co-operatives in all parts of the country. During his talk he presented to the fruit growers the plans for an ideal cooperative packing association which is based on the experience of many of the successful communities now in operation.

The afternoon session was confined to a very thorough discussion by representatives from local associations. At the close of the meeting it was unanimously approved that an energetic campaign for an increased volume of business and a long term contract be undertaken. It was arranged that a committee draw up plans for such a campaign, to be submitted at a later meeting.

Checks, representing substantial payments on apples packed this year, were distributed at the close of the meeting.—N. R. P.

NEW YORK COUNTY NOTES

Ontario Co.—November was very cloudy and a dull month. We had only about three days of sunshine. In spite of the cloudy weather, we had very little rain, however, not enough to make plowing easy. Strange to say October was unusually warm. We had especially good weather for all fall work. Apples that were sold on an early market brought good prices and were well taken care of. Cabbage made a larger crop than was expected at first. A large quantity of it was put into kraut. Corn is now being shredded. A great deal of fall plowing is being done. Some farmers are threshing beans, reporting yields below normal due to the dry weather. Red Kidneys are now selling at \$6.25 a hundred.

Warren Co.—The snow that came on November 24 is all gone. December 1st finds us with the ground not frozen. Roads are in good shape and have been all fall. Many farmers still are leaving their stock out of doors during the day. Stock in general is reported in fine condition for winter. Prices of live-stock are generally low, much below other years. Hay and grain is high. Light horses find very little sale. Heavy work teams are in fair demand. Potatoes were selling for \$2 a bushel. They have dropped since to \$1 and there are no buyers at that. Butter is 50c a lb., eggs 60c and very scarce. Recent rains have filled up many wells that had gone dry during the past season. Prospects are for a very quiet and dull winter.—R. T. A.

St. Lawrence Co.—With the open fall there has been more fall plowing done than in 10 years. Prices of turkeys are much lower than last year. Quotations at Medina vary from 45 to 55c. We had a slight fall of snow on the 24th of last month, but it has all disappeared. Farmers are turning their cattle out every day. The milk flow is holding up well. Many farmers are cutting up wood for winter.—H. S. H.

IN CENTRAL NEW YORK

Chenango Co.—It is seldom that so much fall plowing has been done as was accomplished this year. The way the soil turns up indicates that we need a good deal of rain. We have had practically no snow here as yet, which is extremely uncommon.

Sod plowing in the fall is not quite so common as it used to be. This is partly because pressure of work keeps them back, but it is also partly because many prefer to spread manure before plowing and plow under.

Occasionally a man is becoming interested in the use of acid phosphate with manure. I do not mean by that that its use is becoming general or that it is likely to be. That will depend on results which are not yet determined. There is some interest in it and for oats and seeding the use is quite common. A few are using it on cabbage. One man said to me yesterday that he never used it until last year and then he tried it on a half acre of cabbage using 250 pounds. He harvested thirteen tons of cabbage this fall which is the best he ever raised. He will try again with manure and acid phosphate.

Farmers are not satisfied with the milk situation but I believe that they are coming to understand that the fluid price of \$2.80 is better for them than the \$3.45 price would have been. It is impossible to get a high-fluid price for our milk so long as the dealers can maintain a split in the ranks by the aid of farmers themselves. We may as well admit it and take the consequences.—H. H. LYON.

Runs 24 hours a day FAIRBANKS-MORSE 'Z' engine

Geo. Strahan, South Jacksonville, Fla., says: "The 'Z' engine which I have used for more than a year has exceeded our greatest expectations. At times we operate it for stretches of 24 hours duration. Very economical. Requires no attention whatever." . . . P. W. Ostwald, Baker, Oregon, says: "The 'Z' engine bought in 1916 is the most reliable piece of machinery I ever owned."

Over 350,000 users have approved the "Z" Engine. No matter what your power requirements, there is a "Z" Engine to exactly suit your needs. Over 5,000 dealers carry these engines in stock and will save you money on freight.

EGGS FRAGILE

Oat Sprouter
\$2.99

You can make a better sprouter than you can buy. This sprouter was made in one evening by a 14 year old boy with a saw and hammer. The cost, with heater, was \$2.99. Thousands in use. All say it is the best and handiest made.

Make Layers Out of Loafers

To make hens lay their best in winter, growing green food rich in vitamins, must be fed. Sprouted oats are best. The Putnam Home Made Sprouter yields the best and sweetest sprouts and with the least work. I will send, free, plans for making this sprouter with description of Little Putnam Stove to heat it. Also instructions for use of stove to keep fowls' drinking water unfrozen. Stove holds three pints of oil. Burns a month without trimming or filling. Patented burner. Nothing like it. Ask your dealer, or send me his name and \$2.50 and get one by return mail, postpaid. Try it. If not satisfied, return in 10 days and I'll refund \$2.50.

I. PUTNAM Route 1227-O, Elmira, N.Y.

Interstate Milk Producers Hold Annual Meeting

ATTENDANCE records were broken at the seventh annual meeting of the stockholders of the Interstate Milk Producers Association, which was held December 3 and 4 at the Adelphia Hotel, Philadelphia, Pa., when over 300 delegates registered. The outstanding feature of the meeting was the unanimous and enthusiastic approval of a resolution that the association adopt a sanitary code to apply to all producers and handlers of milk in the Philadelphia Milk Shed. In other words, the producers themselves have taken the initiative in cleaning up their own territory.

The morning session included reports by Secretary Balderston, Treasurer R. F. Brinton and the certified accountant, and election of directors.

The afternoon session was opened with a report of the tellers on the election which was held during the morning. The directors elected for a term of three years consisted of: H. D. Allebach, Montgomery Co., Pa.; S. K. Andrews, Dorchester Co., Md.; I. J. Book, Lancaster Co., Pa.; R. F. Brinton, Chester Co., Pa.; E. H. Donovan, Kent Co., Del.; S. B. Lehman, Franklin Co., Pa.; Albert Sarig, Berks Co., Pa., and F. P. Willits, Delaware Co., Pa. Will Kieth, Queen Anne Co., Md., was elected director for two years. Charles Preston of Chester Co., Pa., was elected director for one year.

Following the report of the tellers, President H. D. Allebach read his annual report. According to Mr. Allebach, the membership now numbers 17,680, the net annual increase in membership during the past year being 2257. However, during the past year new members amounted to 2612. According to Mr. Allebach, one of the outstanding features of the past year was the work of the testing department of the association. In one instance, in particular, he stated that a dealer was convicted for falsifying his reports, his conviction being based on the findings of the tester of the organization. The testing force has also been a vital factor in settling disputes arising between patrons of milk plants and the operators. The 1924 plans call for the expansion of the testing department.

President Allebach reviewed the price situation in great detail, pointing out the higher prices received in 1923 compared with those received in 1922. The average basic price in 1923 was \$2.67 or 70 cents higher than the basic price for 1922. In reviewing the surplus prices for the first nine months of 1923, he stated that the average surplus price for 3 per cent. milk was \$1.78 per 100 pounds as compared with \$1.38 per 100 pounds for 1922 or a 40-cent increase for 1923. Milk sold in class 2 surplus was also 40 cents higher in 1923 than in 1922.

Plans for 1924

Plans for 1924 include the establishment of a statistical bureau which will study markets and milk movements to place its findings before members of the association, expansion of the testing department and the adoption of sanitary standards which stands out as the most important feature. The adoption of sanitary standards will keep out milk dumped on the Philadelphia market that can not find sale in other markets, due to sanitary restrictions. At the present time, Philadelphia has no operating sanitary code relative to the production and handling of milk and as a result any one can dump milk on the Philadelphia market to the detriment of not only the consumers of Philadelphia but to the producers who must take care of the market the year around.

John D. Miller, president of the National Milk Producers Federation and vice-president of the Dairymen's League Cooperative Association, followed Mr. Allebach. In his address Mr. Miller reviewed the work of the National Federation and paid high tribute to men of the Interstate Milk Producers Association who worked for and with the Federation. Reviewing the work of the National Federation and cooperating farm organization, Mr. Miller recalled the bitter fight carried on in Washington to put through legislation relative to "filled" milk, the tariff and the Capper-Volstead Act. Mr. Miller emphatically said that it was the organized and not the unorganized farmers who had made the victory possible. He called attention to the fact that, were it not for organized farmers, tariff laws would still allow foreign butter to flood our market, keeping down prices below cost of production.

Vice-President Shangle of Mercer County, N. J., was next on the program and presented to the meeting the proposition for cleaning up of the Philadelphia Milk Shed. The proposition submitted by Mr. Shangle and which was later unanimously adopted by the meeting is a voluntary move on the part of the association to adopt a sanitary code for milk producers

(Continued on page 416)

"My Engine will do the work of 6"

Read the Amazing Facts about this Wonderful Farm Engine

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."

A. Y. EDWARDS.

My engine—the Edwards Engine—will do the work of six ordinary farm engines. And I am willing to prove this to your entire satisfaction. I don't want you to risk a cent or to place yourself under any obligation.

No Other Engine Like It

For thirty years I have been designing and building engines of all types and sizes, from one horsepower to one thousand horsepower. Every working day of my life in business has been devoted to internal combustion engines. The farmer's power needs have been uppermost in my mind during these years. My experience on a farm proved to me just what kind of an engine a farmer needs. It was a problem that required a complete knowledge of what could be done or should not be done in building engines.

Six years ago the Edwards Farm Engine was put on the market, and today thousands of farmers who own Edwards Engines tell me that I have solved the problem of farm power. There is no other engine like it. It will do more for you than any other engine possibly could do.

6 Engines In 1

It is only one engine, yet it takes the place of six engines. It will give from 1½ to 6 H. P. You can change power instantly while the engine is running. Change it as you need it, —1½ H. P. when you need 1½, or 6 H. P. when you need 6. Or any power needed in between these two.

Wonderful Economy

Fuel consumption is always in proportion to the power used, and is remarkably low at all times. It burns kerosene or gasoline and will do the work at a fuel cost so low it will surprise you.

Easy to Operate

The Edwards Engine is so light that two men can carry it easily from job to job. Pick it up and set it down anywhere. It is so perfectly balanced that it requires no anchorage. This wonderful balance and smooth running also make for long life and durability. Easy starting, no cranking.

For Every Farm Job

The Edwards Engine will run a feed cutter, corn sheller, fanning mill, light plant, saw, washing machine, small silo filler, fodder cutter, pump, milking machine,—these and many other pieces of power equipment on your farm. And it does each of these jobs economically with fuel consumption according to the load pulled—not another engine on the market can duplicate this guaranteed performance.

Prices Lower Than Before War

My prices today are lower than before the war. They offer you real economy in first cost as well as in operation.

FREE TRIAL

The Most Liberal Offer ever made by any Engine Manufacturer!

You can prove all my claims to your own satisfaction. I am willing to send you an Edwards Engine for absolutely free trial. I don't want you to send me one penny or to obligate yourself in any way. I just want you to take the engine and try it—use it for all of your farm work, put it on every job you can think of. After that, if you're not satisfied, you can return the engine to me without the payment of a single cent.

Free Book

Without any obligation to you, I will send you a free booklet describing the Edwards Engine in detail, giving proof of every claim I make and telling you all about my Free Trial Offer. Just fill in and mail the coupon.

Why Is a Feed Manufacturer?

(Continued from page 405)

gluten and the other ingredients come from, they are bound to contain a certain amount of tramp iron, nails, pieces of wire, shreds of steel from milling machinery—a formidable collection of "junk" of all kinds that is highly dangerous to cows. Many cows fall sick and die from swallowing nails, tacks and bits of wire in their feed.

All of this matter must be removed from his ration by the feed manufacturer. There may be a great deal of it, or there may only be a small amount. It makes no difference. The feed manufacturer must have his machinery and electro-magnets always at work, exerting their magnetic force upon the finished product, if he is to be sure that his customers are not playing hide and seek with the danger of losing valuable cows.

These things are done nowadays by the feed manufacturer because the dairyman himself cannot take the time to do them and because all of these operations require equipment which it would not pay an individual farmer to buy and use solely for himself and his neighbors.

What is back of all this care? Ask a manufacturer why he is in business and he will tell you, if he is honest, that his object is to make money. If he is also wise he knows that the only way he can make money is to give his customers the fullest possible value for every dollar they spend for his goods. He also knows that this value must include all the things we mean by that much abused word called "service." He must render service, not on paper, but in fact. He must help his customers in every way and in many ways that give no immediate promise of results.

Farmers are just beginning to apply business principles to dairying, to treat their cows with the same care that they treat the engine of an automobile, and check up on the milk mileage they get out of their cows. Feed manufacturers are helping farmers and dairy-men to do this. They are putting authoritative information into their hands about the care and feeding of cows. They are employing feeding specialists who do nothing else but study feeding problems and write letters to people who ask assistance. They also go and see these farmers when the occasion requires, and they employ as salesmen trained men who know and like cows and who, very often, are expert feeders themselves.

It is said that some day America, like the European countries, will cease to be primarily a meat-eating nation, and that we will eat more milk products and vegetables. There is good evidence that this prophecy is coming true, for our western ranges no longer boast the vast herds of beef cattle they once did. The dairy cow is supplanting the beef cow. People want more milk than meat. Many western range beef cows have sold this year at a profit of \$10 a head for their owners, while dairy cows in the same market netted their owners a profit ten times as great. Dairying is on the up swing. Milk products are coming into their own. Milk consumption is increasing very rapidly.

We feed manufacturers are working hard to help this great movement, to help spread the gospel of better cows, better care, better feed, and more milk for every man, woman and child. It is the message of health, the message of service to humanity. It looks to the realization of a big shining ideal which transcends all considerations of profit and lifts the entire dairy industry from the plane of commonplace business to that of a magnificent crusade for healthier children and healthier grown-ups.

Your paper is quite necessary on our farm and in its management.—GEO. W. FENNER, Masonville, N. Y.

We could not do without the American Agriculturist, we like it so much.—GEO. M. STONE, Massena, N. Y.

ALL MEN, WOMEN, BOYS, GIRLS—17 to 65, willing to accept Government positions, \$117-\$250, traveling or stationary, write MR. OZMENT, 258, St. Louis, Mo., immediately.

The Broad Highway—By Jeffery Farnol

THE place was small, and comprised two rooms shut off from each other by a strong partition with a door midway. Lifting the candle, I glanced at the staple on which the builder of the cottage had choked out his life so many years ago, and, calling to mind the Ancient's fierce desire to outlast it, I even reached up my hand and gave it a shake. But, despite the rust of years, the iron felt as strong and rigid as ever. The second room appeared much the same size as the first, and like it in all respects, till, looking upwards, I noticed a square trap-door in a corner, while underneath, against the wall, hung a rough ladder. This I proceeded to lift down, and, mounting, cautiously lifted the trap.

Holding the candle above my head to survey this chamber, or rather garret, the first object my eye encountered was a small tin pannikin, and beyond that a stone jar, or demijohn, nearly full of water quite sweet and fresh to the taste, which, of itself, was sufficient evidence that some one had been here very lately. I now observed a bundle of hay in one corner, beside which were a cracked mug, a tin plate, a pair of shoes, and an object I took to be part of a flute or wind instrument. But what particularly excited my interest were the shoes, which had evidently seen long and hard service. Very big they were, and somewhat clumsy, thick-soled, and square of toe, and with a pair of enormous silver buckles.

These evidences led me to believe that whoever had been here before was likely to return, and, not doubting that this must be he who had played the part of ghost so well, I determined to be ready for him.

So, leaving all things as I found them, I descended.

In the first room was a rough fireplace and as the air struck somewhat damp and chill, I went out and gathered a quantity of twigs and dry wood, and had soon built a cheerful, crackling fire. I now set about collecting armfuls of dry leaves, which I piled against the wall for a bed. By the time this was completed to my satisfaction, the moon was peeping above the treetops, filling the Hollow with shadows.

I NOW lay down upon my leafy couch, and fell to watching the fire and listening to the brook outside. In the opposite wall was a window, the glass of which was long since gone, through which I could see a square of sky, and the glittering belt of Orion. Gradually my head grew heavier and heavier, until, at length, the stars became confused with the twinkling sparks upon the hearth.

I must have slept for an hour, or nearer two (for the room was dark, save for a few glowing embers and the faint light of the stars) when I suddenly sat bolt upright, with every nerve tingling. From somewhere close outside the cottage, there rose a sudden cry—a long-drawn-out, bubbling scream (no other words can describe it), that died slowly down to a wail only to rise again higher and higher. Then all at once it was gone, and silence rushed in upon me—a silence fraught with fear and horror unimaginable.

I lay rigid, the blood in my veins jumping with every throb of my heart. And then the cry began again, deep and hoarse at first, but rising, rising until the air thrilled with a scream such as no earthly lips could utter.

Now the light at the window grew stronger and stronger, and, all at once, a feeble shaft of moonlight crept across the floor. I was watching this most welcome beam when it was again obscured by something, which I gradually made out to be very like a human head peering in at me; but, if this was so, it seemed a head hideously misshapen—and there, sure enough, rising from the brow, was a long, pointed horn.

AS I lay motionless, staring at this thing, my hand encountered the pistol in my pocket; and, from the very depths of my soul, I poured benedictions upon the honest head of Simon the Innkeeper. With a single bound I was upon my feet, and had the weapon levelled at the window.

"Speak!" said I, "speak, or I'll shoot." There was a moment of tingling suspense, and then:

"Oh, man, dinna do that!" said a voice.

"Then come in and show yourself!"

Herewith the head incontinently disappeared, there was the sound of a heavy step, and a tall figure loomed in the doorway.

"Wait!" said I, as, fumbling about, I presently found tinder-box and candle, having lighted which I turned and beheld an exceedingly tall man—clad in the full habit of a Scottish Highlander. By his side hung a long, straight, basket-hilted sword, beneath one arm he carried a bagpipe, while upon his head was—not a horn—but a Scot's bonnet with a long eagle's feather.

"Oh, man," said he, eyeing me with a somewhat wry smile, "ye're no' afeared o' bogles, whateffer!"

CHAPTER XXVII

THE HIGHLAND PIPER

WHO are you?" said I, in no very gentle tone.

"Donald's my name, sir, an' if ye had an e'e for the tartan, ye'd ken I was a Stuart."

"And what do you want here, Donald Stuart?"

"The verra question I'd be askin'—wha' gars ye tae come here?"

"It is my intention to live here, for the future," said I.

The Highlander smiled his wry smile, and taking out a snuff-box, inhaled a pinch, regarding me the while.

"Ye're the first as ever stayed—after they'd heard the first bit squeakie."

"But how in the world did you make such awful sounds?"

"Oh, it's juist the pipes!" he answered, patting them affectionately, "will I show ye the noo?"

"Pray do," said I. Hereupon he set the mouthpiece to his lips, inflated the bag, stopped the vents with his fingers, and immediately the air vibrated with the bubbling scream.

"Oh, man!" he exclaimed, laying the still groaning instrument gently aside, "oh, man! is it no juist won'erful?"

"But what has been your object in terrifying people out of their wits in this manner?"

THE Piper smiled, then, and, unwinding the plaid from his shoulder, spread it upon the floor, and sat down.

"Ye maun ken," he began, "that I hae muckle love for the snuff, and snuff is unco expensecve."

"Well?" said I.

"Ye maun ken, that ma brither Alan canna' abide the snuff."

"Go on," said I, "I'm listening."

"Weel, I'm a braw, bonnie piper, an' ma brither Alan, he's a bonnie piper too. Aweel, I fell in love wi' a lassie, which wad ha' been a richt if ma brither Alan hadna' fallen in love wi' her too, so that she, puir lassie, didna' ken which tae tak'. 'Then, Alan, says I, 'we'll juist play for her.' Which I think ye'll own was a grund idee, only the lassie couldna' mak' up her mind which o' us piped the best. So the end of it was we agreed, ma brither Alan an' I, to pipe oor way through England for a year, an' the man wha came back wi' the maist siller should wed the lassie."

"And a very fair proposal," said I, "but—"

"Wheest, man! juist here's where we come to the snuff, for, look ye, every time I bought a paper o' snuff I minded me that ma brither Alan, not takkin' it himself, was so much siller tae the gude—an'—oh, man! it used tae grieve me sair—till, one day, I lighted on this bit hoosie."

"Well?" said I.

"Eh, man! ma brither Alan he must hae a bed o' nights, an' pay for it too, ye ken. An' many's the nicht I've slept the sweeter for thinkin' o' that saxpence or shillin' that Alan's apartin' wi' for a bed. So wishfu' tae keep this bit hoosie tae myself, I juist kep' up the illusion. Eh! but 't was fair grund tae see 'em rinnin' awa' as if the de'il were after them, an' a' by reason of a bit squeakie o' the pipes, here."

I now proceeded to build and relight the fire, during which the Scot drew a packet of bread and cheese from his sporran, and I, following his example, took out the edibles Simon had provided.

"An' ye're minded tae bide here, ye tell me?" he inquired after a while.

"Yes," I nodded, "but that need not interfere with you. Now that I have had a good look at you, I think we might get along very well together."

"Sir," said he solemnly, "my race is royal—here's a Stuart's hand," and he reached it out to me across the hearth.

"How do you find life in these parts?" I inquired.

"Indefferent, sir! Tae be sure, at fairs I've often had as much as ten shillin' in ma bonnet at a time; but it's juist the kilties that draw 'em; they hae no real love for the pipes, whateffer!"

"That is a question open to argument, Donald," said I; "can any one play real music on a bagpipe?"

"SIR," returned the Scot, setting down the empty flask and frowning darkly at the fire, "the pipes is the king of a' iustriments, 't is the sweetest, the truest, the oldest, whateffer!"

"True, it is very old," said I thoughtfully; "it was known, I believe, to the Greeks. Yes, it is certainly a very old, and, I think, a very barbarous instrument."

"Hoot toot! the man talks like a muckle fule," said Donald. "Hae ye ever heard the pipes?"

"Why, yes, but long ago."

"Then," said Donald, "ye shall juist hear 'em again." So saying, he took up his instrument, and began slowly inflating it.

Then, all at once, from drones and chanter there rushed forth such a flood of melody as seemed to sweep me away upon its tide.

First I seemed to hear a roar of wind through desolate glens, a moan of trees, and a rush of sounding waters; yet softly, softly there rises above the flood of sound a little rippling melody which comes and goes. And now, the swing of marching feet, the tread of a mighty host whose step is strong and free; and lo! they are singing, as they march, and the song is bold and wild. Once again the theme changes, and it is battle, and death, sudden, and sharp; there is the rush and shock of charging ranks, above whose thunder, loud and clear and shrill, like some battle-cry, the melody swells.

But the thunder rolls away, distant and more distant—the day is lost, and won; but, sudden and clear, the melody rings out once more, fuller now, richer, and complete. And yet, what sorrow, what anguish unspeakable rings through it, the weeping and wailing of a nation! So the melody sinks slowly, to die away in one long-drawn, minor note, and Donald is looking across at me with his grave smile, and I will admit both his face and figure are sadly blurred.

"Donald," said I, after a little, "Donald, I will never speak against the pipes again; they are indeed the king of all instruments—played as you play them."

"Ou ay, I'm a bonnie piper, I'll no deny it!" he answered. "T is a bit pibroch I made tae Wullie Wallace. Aweel! he was murdered afore your time or mine—so—gude-nicht tae ye, Southeron!" Saying which, he rose, and stalked majestically to bed.

CHAPTER XXVIII

HOW BLACK GEORGE AND I SHOOK HANDS

THE world was full of sunshine, and the blithe song of birds, as I rose next morning, and, coming to the stream, threw myself down beside it, plunged my hands and arms and head into the limpid water.

In a little while I rose, with the water dripping from me, and having made shift to dry myself upon my neckcloth, nothing else being available, returned to the cottage.

Above my head I could hear a gentle sound rising and falling with a rhythmic measure, that told me Donald still slept; so, clapping on my hat and coat, I started out to my first day's work at the forge.

Long before I reached the smithy I could hear the ring of Black George's hammer, though the village was not yet astir, and it was with some trepidation that I approached the open doorway.

There he stood, busy at his anvil, goodly to look upon in his bare-armed might. He might have been some hero, or demigod, rather than a village blacksmith, and a very sulky one at that: for though he must have been aware of my presence, he never glanced up.

NOW, as I watched, I noticed a certain slowness—a heaviness in all his movements—together with a listless, slipshod air which, I judged, was very foreign to him.

"George!" George went on hammering. "George!" said I again. He raised the hammer for another stroke, hesitated, then lifted his head with a jerk.

"What do 'ee want wi' me?"

"I have come for two reasons," said I; "one is to begin work—"

"Then ye'd best go away again," he broke in; "ye'll get no work here."

"And the second," I went on, "is to offer you my hand. Will you take it, George, and let bygones be bygones?"

"No," he burst out vehemently. "No, I tell 'ee. Ye think to come 'ere an' crow o'er me, because ye beat me, by a trick, and because ye heard—her—" His voice broke, and, dropping his hammer, he turned his back upon me. "Called me 'coward'! she did," he went on after a little while. "I've been a danged fule!" he said, more speaking his thoughts aloud than addressing me, "but a man can't help lovin' a lass—like Prue, and when 'e loves 'e can't help hopin'. I've hoped these three years an' more, and last night—she called me—coward."

Again there fell a silence wherein came the tap tapping of a stick upon the hard road; whereupon George seized the handle of the bellows and fell to blowing the fire vigorously. A moment after the Ancient appeared, a quaint, befrooked figure, framed in the yawning doorway. He stood a while to peer about, his old eyes still dazzled by the sunlight, owing to which he failed to see me in the shadow of the forge.

"Marnin', Jarge!" said he, with his quick, bright nod. The smith's scowl was blacker and his deep voice gruffer than usual as he returned the greeting; but the old man seemed to heed it not at all, but, taking his snuff-box from the lining of his tall, broad-brimmed hat (its usual abiding place), he opened it, with his most important air.

"Jarge," said he, "I'm thinkin' ye'd better tak' Job back if you'm goin' to mend t' owd screen."

"What d'ye mean?" growled Black George.

"Because," continued the old man, with great deliberation, "because Jarge, the young feller as beat ye at the throwin'—im as was to 'ave worked for ye—be dead."

"What!" cried Black George, starting.

"Dead!" nodded the old man, "a corp 'e be—eh! such a fine, promisin' young chap, an' now—a corp!" Here the Ancient nodded solemnly again, and inhaled his pinch of snuff with great apparent enjoyment.

"Why—" began the amazed George, "what—" and broke off to stare, open-mouthed.

"Last night, as ever was," continued the old man, "e went down to th' 'aunted cottage—'tweren't no manner o' use tryin' to turn 'im, no, not if I'd gone down to 'im on my marrer-bones. Off he goes to sleep in th' 'aunted cottage—so now I'm a-goin' down to find 'is corp—"

He had reached thus far, when his eye, accustomed to the shadows, chancing to meet mine, he uttered a gasp, and stood staring at me.

"Peter!" he stammered at last. "Peter—be that you, Peter?"

"To be sure it is," said I.

"Bean't ye—dead, then?"

"I never felt more full of life."

"But ye slep' in th' 'aunted cottage last night."

"Yes."

"Why then I can't go down and find ye corp' arter all?"

"I fear not, Ancient."

The old man slowly closed his snuff-box, shaking his head as he did so.

"Ah, well! I won't blame ye, Peter," said he magnanimously; "it bean't your fault, lad, no—but what's come to the ghost!"

"The ghost," I answered, "is nothing more dreadful than a wandering Scotsman!"

"Scotsman!" exclaimed the Ancient.

"Yes, Ancient," said I. "Those shrieks and howls he made with his bagpipe."

The Ancient, propped upon his stick, surveyed me with an expression that was not exactly anger, nor contempt, nor sorrow, and yet something of all three. At length he sighed, and shook his head at me mournfully.

"Peter, I seen Scotsmen afore now," said he, with a reproachful look, "ah! that I 'ave, an' Scotchmen don't go about wi' 'orns on their 'eads. An', Peter, I know what a bagpipe is; I've heerd 'em often an' often—squeak they do, yes, but a squeak bean't a scream, Peter, nor yet a groan—no." Having delivered himself of which, the Ancient shook his

(Continued on page 415)

WHAT HAS HAPPENED IN THE STORY

PETER VIBART, after many adventures on the broad highway, comes to a village where he makes friends with an ancient man and wins in a contest of hammer-throwing with the local blacksmith. As this means that "Black Jarge," the smith, will hire him as a helper, Peter sets out for a near-by empty cottage he has seen, which he means to make his home. He persists in going there although his new friends warn him it is haunted.

Embury
SUPREME
LANTERNS

No. 160

\$ 1.50

You cannot buy a better lantern than the Embury Supreme. Compare it in every detail with lanterns of other makes. We invite this comparison because we want you to see what the Embury has been doing in the way of improvement.

No. 160 is one of the most popular styles. It has the short globe, the improved burner, one inch wick, which gives 20% more light, and burns 35 hours. Windproof and rainproof.

Order from your dealer. If he has none in stock we will mail postpaid on receipt of price.

NOTE—When ordering by mail, be sure and mention No. 160

Home-Made Christmas Decorations

Pretty Ways of Fixing the Tree and House—Other Holiday Ideas

TO provide a proper atmosphere for Christmas jollifications nearly all of us decorate our houses; while in a majority of homes the Christmas tree too calls for decorations. If pennies must be carefully spent, many of these may be made at home and the whole family can help.

With a few red, green, or red and green bells (crepe-paper) of various sizes; a roll each of red and of green crepe paper; a few yards of silver tinsel; some picture wire; some gilt paper; some old, small boxes; a pair of scissors; and perhaps glue and thread, a large assortment of Christmas "fixin's" may be made.

To decorate the living-room, cut long strips of crepe paper (four or five inches wide), one strip of red and one of green. Twist them loosely together until an equal amount of each color shows from each side. Hang these in festoons from opposite corners of the room, and from the sides, having all strips cross at center of room. Catch all together there, and hang a bell or other ornament at this point, having all fastened securely to ceiling, leaving graceful drooping strips in all directions. Hang bells or wreaths in the windows. Home-made wreaths are very nice if one is clever at making them. A sprig of mistletoe in one or more convenient places will contribute to the amusement of the occasion.

Evergreen branches with their woody fragrance are an appropriate decoration too. Also red berries from shrubs.

When the Tree Is Decorated

For the tree, the simplest home-made trimming and one furnishing a lovely contrast in any light is just the plain old-fashioned popcorn strings.

Select all big puffy kernels and string them on thread, using a fine needle. Make as long as possible and by careful handling they will keep from year to year,—not as a matter of economy but once strung, the work of preparing them need not be repeated unless desired. We think the corn doesn't taste very good after being hung on the tree, as we leave our tree up for about a week, and the corn dries out.

Strings of tinsel and ornaments with tinsel catch the eye. To make attractive ornaments, cut a strip of wire and shape as desired. Cover with tinsel and you've a firm, long-lasting ornament. Any number may be made quickly. A big tinsel star is nice for the top-most branch of the tree. Artificial snow (non-inflammable) is showy. I do not approve of candles on a tree.

Candy boxes which look very pretty are easily fixed up at home. Take a small square, round or oblong box and cut from gilt paper a star large enough to cover the box top. Cut another star of the same size from cardboard, glue the gilt on to it, then glue the completed star to the box top. When the box is filled with candy a strip or two of gilt paper may be glued on to keep the cover on, and a loop of ribbon attached to hang it by.

Popcorn Is Inexpensive

A decoration which always pleases the kiddies is the popcorn bag. We put quite a number on our tree to allow for passing them out to anyone who may drop in, and to allow the kiddies one each for every day we have the tree up.

We use mosquito netting in colors (green, red and white) for our popcorn bags, and those we open at home are usually laid aside to use next year, another labor saver for the last busy hours before each Christmas Eve. Most of them are cut in stocking shape firmly sewed with twine in a matching color, and each has a drawstring at the top. These bags are filled with popcorn, a few nuts and some colored candies.

Here is a "stunt" that perhaps not many have tried, but it is well worth trying. If you are giving any "hankies" to members of your family, fasten them (folded four-square) by a corner to branches of the tree. They may be pinned on with a common pin, and a bit of paper with the name of the recipient attached. We leave them on the tree, as we think they are as pretty decorations as any.

Use, Even the Holes of the Doughnuts

When getting the holiday "eats" ready, how many save the "holes" of the doughnuts and make little men to surprise the children? Mother always did that and we children loved them. Just fry the bits of dough and use tooth-picks to join them together for arms, legs, body and head of each doll. They are cunning. These may go in the stocking or may be carefully hung on the tree by means of a bit of black thread. Fancy cookies, apples, oranges, etc., may be attached in the same way. Such trimmings please children more than tinsels and fine ornaments, I believe.

Last, but not least, it is a lovely thing for each family who can possibly afford one to own a crib and set of figures representing the Nativity. These may be obtained for as little as one dollar and their lesson and effect on childish minds is immeasurable. Little folks, as well as we older ones, are often prone to forget the real significance of Christmas and think only of the modern gainful aspect of it. Lessons learned by observation when one is a child stay by through life, and this greatest lesson of all should not be neglected by any parent. It is too beautiful.—
MABELLE ROBERTS.

A CHRISTMAS TABLE FOR CHILDREN

WHEN a family reunion on Christmas day includes a good many children, a separate table for them will not only save much confusion, but what is more important, will keep the children from eating the rich foods provided for the other guests.

A pretty decoration for a children's Christmas table is made by covering a table with plain white oilcloth just cut to fit. All around the edge fasten a frill of bright red crepe paper. This decoration is especially suitable for a circular table. Christmas gilt stars or silver bells can be pasted in a circle around the cloth just inside the plate line. A round mirror framed in tinsel makes a pretty centerpiece. A small Santa Claus riding across it in a papier-mache sleigh will amuse the small guests.

A Jack Horner pie is always popular with the children. Make it with red crepe paper and cotton batting, using a large shallow tin pan for a foundation. Place little gifts or homemade bonbons wrapped in colored paper inside, attaching red ribbons which come through slits in the crust and reach to each plate. At the close of the meal, have the children pull on their ribbons and pull out their gifts.

Another table decoration that the children will like is a little toy auto filled with dates, raisins and figs or with mixed nuts. Have a dressed-up doll for a chauffeur.

The menu for the children's table may consist of turkey and gravy, mashed potatoes, mashed squash, baked onions and creamed cauliflower. Serving each child individually, so they will not be tempted to eat too much of any one food, is a good plan.

Of course there should be some nuts and homemade bonbons with which to end up the meal and little dishes of ice-cream with thin slices of a wholesome cake.—H. A. LYNAN.

"Are you sure there was nothing else in the living room, Ma?"

After a fire is not the best time to make an inventory. The property is so completely destroyed by the flames as to be unrecognizable and many things are forgotten when your claim is made on the insurance company.

Send for the free copy of the Hartford Farm Inventory Book, "My Property". The "Put-It-Away" Habit

Remember the Birds at Christmas Time, Too!

CHILDREN learn to love work quite as well as play if the mother uses tact and wisdom in assigning the first personal tasks. But a child learns gradually. It will be useless to pick up baby's toys for two or three years and then suddenly some day announce to him that he must do it himself. Not only will he rebel at the discipline of the task, but he will be really bothered about how to go about it and just where everything belongs.

A better method is to start as soon as Bobbie can get around on his feet by himself. Pick up the toy dog and say, "Now let's put Fuzzy-

to rummage through boxes for bits of worsted; but some day your children will look back as I look now and their tenderest memory will be of the little mother whose tired hands cut the bread and cake and suet for the birds' Christmas tree. And they will be glad they had that kind of a mother.—I. R. HEGEL.

USES FOR DISCARDED INNER TUBES

A PAIR of stout shears, a few minutes' work, and lo, I have an abundance of small round rubber mats cut from our discarded automobile inner tubes! Placed beneath more decorative mats or doilies, they protect absolutely our mantels, tables and dressers from the ugly rings that come sooner or later from flower vases. They may be of any desired size or shape.

These tubes also furnish us with all the rubber bands of varying widths that we can use, altho these must be cut from the unbroken or least worn parts of the tube. A groceryman uses them to fasten up many small packages, and small boys love to trade with him.

And when our new hose was found to be without proper washers it took but a bit of work to cut a number of them from the scraps left from my mats. A little girl or an invalid can turn out a quantity of these handy things from an otherwise useless tube.—LEE McCRAE.

The Broad Highway

head at me again, and, turning his back, hobbled away.

When I turned to look at George, it was to find him regarding me with a very strange expression.

"Sir," said he ponderously, "did you sleep in th' 'aunted cottage last night?"

"Yes, though, as I have tried to explain, it is haunted by nothing more alarming than a Scots Piper."

"Sir," said George, in the same slow, heavy way, "I could n't go a-nigh the place myself—specially arter dark—I'd be—ah! I'd be afraid to! I did go once, and then not alone, and I ran

FOR SLIM OR STOUT

AN ideal style for everyday wear that must also be a trifle dressy is No. 1960, which by the simple side drapery and inserted vest offers opportunity for brightening an otherwise severe line. The crossed fronts and alternative of tight-fitting or open sleeves makes the model becoming to either a slim or a stout figure.

No. 1960 cuts in sizes 36, 38, 40, 42 and 44 inches bust measure. Size 36 takes 3¾ yards 40-inch material with ¾ yard contrasting. Price 12c. Order from Pattern Department, AMERICAN AGRICULTURIST, 461 Fourth Avenue, New York City. Be sure your full name and address are given!

FOR NEW OR MAKE-OVER

THE long-line silhouette of the present season is used effectively in No. 1935, a slenderizing model which almost any age could wear. It is smart in the new jersey or twill, in soft satin or crepe de chine, and here's just a suggestion—if you've grown a little stouter since last year—get out that serge or silk dress that's a bit too tight and see if you can't cut it over, with a little plaid or figured silk added, into a very modern and becoming gown.

No. 1935 comes in sizes 36, 38, 40, 42 and 44 inches bust measure. For size 36, 3½ yards contrasting.

Price 12c. Order from Pattern Department, AMERICAN AGRICULTURIST, 461 Fourth Avenue, New York City.

wuzzy in the corner of the box here. That's his home." Bobbie is bound to be interested. The next day when playtime is over suggest that Bobbie take Fuzzy-wuzzy home all alone. He will be as proud as anything to do this little task. So for several weeks let this bit of work grow into a habit. Then add one other toy. Bobbie can by this time carry one under each arm, which also is a big achievement in his eyes. The point is, stick to one thing—teach just one task until it is no trouble for the child to do it. Later he can haul several toys in his little red wagon.

So from caring for toys he can learn to hang up his coat. Be sure there is a hook low down and easily accessible. He should learn to put all his clothes away, and thus become a real helper, for as every mother will admit, picking up the children's clothing from places where it has been strewn, demands many hours of time in the course of the year.

There isn't a doubt but that very small children can be trained to do many tasks successfully—often surprising a casual observer who happens to drop in during their performance but who has not been a witness to the gradual development. However, two important points must be remembered: the tasks must be taught one at a time and they must be made a part of the daily routine. It is useless to have baby pick up the toy dog two days a week and mother do it the rest of the time. "Keep everlastingly at it!"

THE BIRDS' CHRISTMAS TREE

ONE of the happiest recollections of my childhood is not the big fir tree resplendent in tinsel, candy and fruits, but the forlorn little fir tree which stood in the rear of the yard. That was the real Christmas tree!

Every year while Dad and Mother trimmed the big tree, we youngsters would pull on our mittens and caps and go out to trim it for the birds.

We tied on bits of bread with gaily colored strips of worsted; tiny balls of fat or suet; a few pieces of Mother's Christmas cake and even an apple. And oh, what fun it was, out there in the frosty air with the breath of snow in it; the chatter of the birds as they viewed us impatiently and the shouts of the neighbors' children as they helped us in our task!

Somehow as I look back, the memory of the birds' Christmas tree grows more and more cherished and I wonder more mothers do not give their children the opportunity to remember the birds at holiday time.

Of course, in the Christmas rush and bustle, it will be difficult to bother with cutting up bits of bread, fruit and suet; it will take time

Aspirin

Beware of Imitations!

Reviewing the Latest Eastern Markets

BEEKEEPERS AT WORK ON MARKETING PROBLEMS

HERSCHEL H. JONES

THE annual joint meeting of the New York State Beekeepers Association and the Empire State Honey Marketing Cooperative Association held last week in Syracuse marked another forward step by producers to bring about better marketing of honey. Beekeepers from all over the State met together to hear of the progress of the past year and make plans for next season.

That cooperative marketing of honey was feasible was demonstrated from the work of the association this year when not only were considerable quantities of bulk honey sold through the Association but large amounts put up in glass jars and pails under their own "Blossom Sweet" brand. The Association put on a large sales exhibit at the Apple Exposition and at the Hotel Show in New York City. Thousands of visitors got their first taste of delicious New York State honey at these two shows.

New York beekeepers this season have been particularly fortunate in that they have had a large crop in the face of a nation-wide honey shortage. Reports from large producing sections like California and other western States show very light production with most of the honey already out of the hands of the producers.

APPLE MARKET STILL DULL

The Western New York apple market has been dull. Virginia apples in cold storage are beginning to move out. Exporters expect the holiday demand in England to improve the market there considerably.

Greenings and Baldwins are most in demand for immediate consumption at New York. Bulk apples orchard run, culls out, sold at N. Y. December 6 at \$1.50 to \$2.25 for red varieties and \$2.25 to \$2.75 for green per bbl.

Following are quotations on A Grade minimum 2½-inch N. Y. State barreled apples at N. Y. December 6; per bbl., BALDWIN, \$4 to 4.50; few, fancy, \$5 to 5.50. BEN DAVIS, \$2.50 to \$3. GREENINGS, \$5.50 to 6. HUBBARDSTON, \$3.50 to 3.75. NORTHERN SPY, \$5.50 to 6; few, fancy, \$6.50 to 7.

POTATO TRADING SLOW

Unusually mild weather and a limited demand last week forced prices on potatoes in the New York City wholesale markets down to a very low point. Long Islands in 150-lb. sacks sold for \$3.50; Maines, \$2.50 and States, \$2.15.

Carlot quotations on Long Islands ranged from \$2.90 to \$3 per 150-lb. sack f. o. b. loading point; on Maines from \$2.60 to \$2.70; and on States from \$2.25 to \$2.35.

CABBAGE PRICES FIRM

Cabbage prices for the best medium Danish stock were firm. Carlots were quoted f. o. b.

loading point at \$22 ton. In the city trade was quiet at prices ranging from \$28 to \$30 ton.

HAY EASIER

The market was easy on lower grades of hay and good hay in very small supply. A sale of No. 1 large bales was reported at \$30. Most hay on the market is Canadian small baled. Average quality hay ranges in price from \$24 to \$26.

CASH GRAIN QUOTATIONS

Cash grain quotations on December 7 were as follows:

NEW YORK, WHEAT, No. 2 red, \$1.24¾. CORN, No. 2 yellow, 94¾¢; No. 2 mixed, 92¾¢; No. 2 white, 94¾¢. OATS, No. 2 white, 54½¢; No. 3 white, 53¢; ordinary white clipped, 56 to 57¢. RYE, 79½¢. BARLEY, 79 to 81¢.

CHICAGO, WHEAT, No. 2 red, \$1.09. CORN, No. 2 yellow, 80¢; No. 3 white, 74¾ to 75¢; No. 3 yellow, 75 to 77½¢. OATS, No. 2 white, 45 to 46½¢; No. 3, white, 44¼ to 45¼¢. RYE, 68½ to 69¢. BARLEY, 60 to 81¢.

EGG MARKET FIRM

The market showed a firm tone last week for medium grade eggs and pullets when of good weight and new laid quality.

BUTTER TRADING IMPROVES

A fair volume of business was reported in butter last week and the prospects are that fine stock will clear reasonably well.

Critical buyers are offering 55 to 55½¢ per lb. for higher score butter.

CHEESE MARKET DULL

Feeling in the cheese market was barely steady last week. Some business was reported on held Daisies and cured State flats ranged in price from 25½ to 26½¢. Little fresh stock arrived and demand was lacking.

POULTRY MARKET FIRM

The market on fowls last week was strong in favor of the sellers and premiums of 2 to 4¢ above quotations were offered by buyers. Express shipments of average fowls sold at 27 to 30¢ per lb.

Although the supply of turkeys is not excessive there was difficulty in moving them even at prices lower than quotations.

LIVE CALVES ADVANCE

Supplies of live calves became very low and buyers were looking forward to shipments expecting to pay full prices. Prices were firm and a few of the choice selected veals brought \$15. Choice dressed veals brought 20 to 21¢.

Chenango County Farm Bureau Holds Annual Meeting

(Continued from page 409)

grown and in most cases oats also. Some grow barley and these make excellent feeds. It

seems to be coming to the minds of many that cows do not need quite so much protein as has been considered desirable. Now that protein feeds are so costly it is time to make use of this idea if it will work. Dr. Warren did not go into this very much as his address was on the economic side of the question.

Whether it is now best for a man to buy a farm he seemed to think depends on many things. Possibly in some cases it may be as well to earn wages a little longer while they are high and delay, not too long, the purchase of a farm rather than go heavily in debt. It seemed to be his opinion that the price level will eventually shade off to somewhere near the pre-war level but taxes will remain high for a long time.

Interstate Milk Producers Hold Annual Meeting

(Continued from page 411)

delivering milk in Philadelphia as well as creameries, milk stations and dealers' quarters. This sanitary code covers the condition of barns and outbuildings, both interior and exterior. It provides for sanitary handling of milk, proper ventilation and cleaning of the barns, removal of manure, protection of the water supply, cleaning and testing of cattle, cleaning of milk utensils, condition of milkers, and cooling and storing of milk. In commenting on the proposition, Secretary Frank Willits stated that the adoption of a sanitary code would keep out of Philadelphia a lot of foreign milk and cream that is produced under conditions not governed by sanitary codes and which helps to break the Philadelphia milk prices.

On December 4, following a tour of local distributing and ice-cream manufacturing plants, three short demonstrations each were given by members of the dairy council. Following these demonstrations, E. R. Quackenbush, manager of the Pittsburg Dairy Council and formerly a field man of the Interstate Milk Producers Association, addressed the meeting. His subject was "Creating Markets for Dairy Products." Following Mr. Quackenbush, J. M. McKee, Deputy Secretary of Agriculture of the Commonwealth of Pennsylvania, spoke on "What the State Has Done for Dairymen." F. W. Heaps, secretary of the Maryland State Dairymen's Association, followed Mr. McKee with an address on how the Maryland Association cooperated with the City Board of Health.

Color Your Butter

"Dandelion Butter Color" Gives That Golden June Shade Which Brings Top Prices

Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade. "Dandelion Butter Color" is purely vegetable, harmless, and meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Absolutely tasteless. Large bottles cost only 35 cents at drug or grocery stores. Wells & Richardson Co., Burlington, Vt.

NEW LAMP BURNS 94% AIR

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

SELDOM SEE

How I Raise My Turkeys

MRS. K. F. VAN HOUSE

THE very first thing I do is to select my "overkeepers" and I do this not later than Thanksgiving or Christmas, when I can get the choice mature birds before they are killed for market. Some leave it until spring when they must take what they can get, scrub stock. During the winter months I keep them in a sheltered place and they will be ready for early mating in the spring. When they begin laying, which is generally about the first of March, I place conveniently near the buildings an empty sugar barrel for each hen, then I scatter enough loose hay or straw in them to make a nice nest, gather the eggs every day, keeping them in a nice cool place.

I turn the eggs every day. This is to keep the yolk in the center of the egg and insures good hatching. Each then will lay from fifteen to seventeen eggs before wanting to set. As soon as she is ready I put seventeen eggs in the nest, first placing a large piece of sod or moist earth in the bottom of the nest to give moisture to the eggs.

Hatching season, which requires four weeks of incubation for turkeys, must be carefully watched, taking the little peeps from the nest as soon as they are fluffy and dry, to keep the old mother from smothering them. Remove the old mother from the nest as soon as she is through hatching, put her in a large freshly white-washed coop, and build a pen around the coop four by six feet and one foot high. When the little ones are able to fly out of this enclosure they are ready to roam about for half a day, always confining them at night, as a protection against dogs and other night prowlers.

When they are six weeks old they are ready to leave the coop and roost in a small tree and they will do this if provided with a small ladder which any one can make. At the age of six weeks I always examine them carefully for lice, as lice very often kills more young turkeys than any other one thing.

The principal feed which I give my young turkeys is hard-boiled eggs, onions, curds and rolled oatmeal. After they are two months old a little wheat may be thrown to them, continuing on through the summer months. Corn should not be fed as it is too heating. The first of October is the time to begin feeding corn and cornmeal all they will eat, getting them ready for the Thanksgiving and Christmas market.

Turkeys must have a small grove or orchard near the buildings where they can go and find rest and cooling breezes from the hot sunshine of mid-summer. If they do not have something of this kind near they will roam several miles to find it.

Turkey prices in Pennsylvania are from 65 to 75 cents a pound and any farmer's daughter can raise from 50 to 60 turkeys and be well repaid for her labor, besides helping her mother with the household tasks.—MRS. K. F. VAN H., Pennsylvania.

TURKEYS HAVE ROUP

I have been raising turkeys for two years and this year my birds have some kind of sickness or trouble with their heads. Their heads are swollen so that they can hardly see and a watery substance is discharging from their nostrils. It looks like a bad case of catarrh. I have never seen anything like it before.—MRS. H. J. K., New York.

UNDOUBTEDLY your turkeys are suffering from roup. Next to black head, roup is probably more troublesome than any other disease of turkeys. It is particularly likely to occur when the birds are exposed to drafts or dampness. It begins like an ordinary cold, but as it develops a swelling occurs about the eyes. Because of the swelling the disease is often termed swell head.

Roup is highly contagious and for this reason affected birds should be isolated from the flock. If the disease is very bad, the birds should be killed rather than run the risk of spreading the disease through the flock. Where the infection is light, the head, nostrils and mouth can be washed out with some disinfectant such as a solution of potassium permanganate. This solution can be obtained at your drug store.

Where the swelling is serious, it should be lanced and the pus or material which the swelling contains, should be squeezed out, after which the sore may be washed out with some disinfectant.

How Much Money Do Farmers Make?

(Continued from page 408)

farm products have changed to such an extent that these farmers will probably make a small labor income in 1923.

In ordinarily prosperous times we can expect to find one or two farmers out of a hundred making a \$2,000.00 labor income. An occasional farmer makes \$3,000.00, and some make over this amount.

Puts 2 H-P Engine on Your Place For Only \$14.24

Ed. H. Witte, Famous Engine Manufacturer, Makes Startling Offer on Witte Throttling-Governor Magneto-Equipped Engine

Farmers, now more than ever, appreciate the need of power on the farm and know they can make \$500 to \$1,000 additional profit a year with an all-purpose engine.

Ed. H. Witte, nationally-known engine manufacturer, has announced a 2-horse power engine which burns either kerosene, gasoline, distillate or gas with a special throttling governor. It delivers full power on kerosene, gasoline, distillate or gas.

This new WITTE ENGINE has revolutionized power on the farm as it handles practically every job with ease at a fraction of the cost of hired help. Easily moved from one job to another, it is trouble-proof and so simple that a boy can operate it.

To introduce this wonderful new engine to a million new users Mr. Witte has arranged to put it on any place for a 90-day guaranteed test. Since it costs only \$14.24 to take advantage of this sensational offer and nearly a year to pay the low balance, Mr. Witte confidently expects every progressive power-user to be soon using a WITTE. Every reader of this paper who is interested in making bigger profits and doing all jobs by engine power should write today to Mr. E. H. Witte, 1805 Oakland Ave., Kansas City, Mo., or 1805 Empire Bldg., Pittsburgh, Pa., for full details of this remarkable offer. You are under no obligations by writing.

The "U. S." Walrus. Its all-rubber surface gives you complete protection.

Don't track the barnyard into the house

*The "U. S." Walrus slips on over your shoes—
and stands muck and water like a boat*

Slush — mud — barnyard mire — the "U. S." Walrus gives you complete protection from them — and keeps the kitchen floor clean in the bargain!

These tough, rugged, all-rubber overshoes can be slipped on or off quickly over your regular shoes. They are as watertight as any boot. And on the days when the mercury hugs zero their fleece lining keeps your feet warm and comfortable.

What's more—a good douse under the faucet washes the hardest caked mud off clean. Dirt can't stick to that smooth rubber surface!

When you're in and out of the house a lot you'll find the "U. S." Walrus the greatest footwear convenience you've ever known. It gives you perfect protection at a minute's notice—keeps your feet dry and the house free from outside dirt.

Other "U. S." footwear—all built for long, hard wear

"U. S." Boots, built so rugged they're famous wherever boots are worn—Rubbers and Arctics for the whole family—"U. S." Bootees, the all-rubber lace shoe to be worn over your socks—every kind of rubber footwear is included in the big "U. S." line.

Every single one is backed by 75 years of skilled experience. It will pay you to look for the "U. S." trade mark—the honor mark of the largest rubber organization in the world.

United States Rubber Company

Ask for
"U.S." Walrus

The "U. S." Walrus can be washed clean instantly. Its surface is as smooth and waterproof as a boot.

Trade Mark

Easy to slip off and on! One of the big convenient features of the "U. S." Walrus.

Cooperation Is More Than Marketing—By Louis A. Cooley

Letters That Should Be A Warning

How Fakirs Get Your Money—Most Advertisers Are Honest

SINCE we published our first article showing the swindling operations of the Standard Food and Fur Association, letters to our Service Bureau asking for help against other swindlers have more than doubled. We never get over the feeling of wonder and pity that there are so many people in the world who respond to the bait of "something for nothing" and thereby almost always lose much for nothing. Often that "much" is savings that have taken years of sacrifice to accumulate.

A few days ago—after all that has been said about the fakirs, and after all the emphasis that AMERICAN AGRICULTURIST has put on the advice to our people not to buy oil stocks—we received the following letter:

"Would you kindly advise me if Wolf Creek Oil and Gas Company is a reliable company, and if their stock is any good. I have an opportunity to sell my farm on this proposition. Am asking \$3,600, which includes agent's commission of 10 per cent. He says he has a buyer to whom he can sell at \$4,500 if we will accept \$2,250 in cash and 2,250 shares of this company at one dollar per share. The man who wants to buy was through here a week ago and has 25,000 shares of this stock which he was trying to sell. He says the company has never paid dividends, but has sixteen producing wells, and when they get going good, will pay about 25 per cent.

"This is all we know about the company and would greatly appreciate anything you could tell us about them."

To this letter, we replied as follows:

"I know of no greater tragedy, except Death itself, than for a man to work all of his years for a few savings and then lose all through some unwise investment with oil sharks or similar concerns. The English language is not emphatic enough to warn you not to accept this stock on any terms."

At least this farmer wrote to us for advice before he closed the deal. We can understand, too, what a temptation it was to him when he thought he had an opportunity to sell his farm, but it would have seemed that the statement that the oil stock would pay 25 per cent. dividends some time would have been enough in itself to have shown him that it was worthless.

We wish that we could frame as a constant warning and put up in every home some of the letters which we have received since publishing our article on the Standard Food and Fur Association from people who have been duped by these swindlers. Just to show you how extended the operations of this one company were, we give a few of these letters below. Some of the others that we are printing also show that our people appreciate what we are trying to do to develop "truth in advertising" and to eliminate the swindlers from the business world.

"I am dropping you a few lines to let you know my experience with the Standard Food and Fur Association and am glad to know that you are among the many papers that stand for honest advertising. I am one of the many who have been faked by this company and regard them as a set of dishonest people. I have wondered why they have been left to continue business.

"I bought one pair of Belgian Hares from them along about November 12th and paid \$14 for the pair. They promised to give me \$7 a pair for the young when six to eight months old, so when I got ready to ship, I wrote them for instructions and shipped them one pair. They wrote me that they had received them and had sent me a check for same, but I never received the check.

"I have neighbors, also, that say they have done the same thing too, only they did not even answer their letters. I handed the information over to our postal authorities in Washington, but I think they are not interested very much or these kinds of firms would be stopped from faking our people out of our money and doing it through the mails."—J. E., Maryland.

Here's another one, from way up in Maine:

"I have recently been reading the AMERICAN AGRICULTURIST and saw the stories about the Standard Food and Fur Association. I have also had unpleasant experience with this

firm. Last June I sent in an order for \$25 worth of Belgian Hares. After waiting for some time, I received a card that they had shipped the hares. But I never got them. After three or four weeks of waiting I asked them to cancel the order but I have never even heard from them, except the card stating that they had shipped them last June. I recently wrote to them to either ship the rabbits or send me back the money by this time, but they have not done either."—F. E. G., Maine.

F. E. G. will never receive either the hares or his twenty-five dollars.

Here's one from Massachusetts:

"Just a few lines to your paper about the Standard Food and Fur Association. Sometime in the month of February or March, 1923, a friend of mine, a young man, wanted to raise rabbits, thinking he could make money by doing so. After reading the advertisement of the Standard Food and Fur Association, he wrote me about the matter and wanted my advice. I advised him to write to the company and ask them if they would forward the rabbits one-fourth down and the rest C. O. D. They answered him that they preferred the cash. So he sent them \$92. He was to receive three does and one buck of a certain foreign breed. After a long time and

ist, that is, require reference from all advertisers, and expose the fakirs, we would soon be able to trust one another. Here's hoping you keep after them until they are glad to hunt for an honest job."—W. P. D., Pennsylvania.

That's just what AMERICAN AGRICULTURIST has been doing, for we figure that there is no way by which we can render more service to our people than to help clean up these scoundrels and save the fortunes that are being lost every year through unwise investments.

In this connection, may we call your particular attention to the fact that AMERICAN AGRICULTURIST guarantees all of its own advertisements. When you answer one of the advertisements in our columns you may do so with the absolute assurance that if the advertiser fails to make good AMERICAN AGRICULTURIST will refund the price of the goods purchased by our subscribers. Our guarantee, which is printed on the editorial page every week, reads as follows:

The AMERICAN AGRICULTURIST accepts only advertising which it believes to be thoroughly honest.

We positively guarantee to our readers fair and honest treatment in dealing with our advertisers.

We guarantee to refund the price of goods purchased by our subscribers from any advertiser who fails to make good when the article purchased is found not to be as advertised.

To benefit by this guarantee subscribers must say: "I saw your ad in the AMERICAN AGRICULTURIST" when ordering from our advertisers.

We are constantly turning down thousands of dollars' worth of advertising about which there might be some question. However, the great bulk of modern advertisers are reputable and honest business men whose statements can be depended upon. All modern business including even that of farm marketing must advertise to succeed and the advertising columns of honest and reliable publications are like great department stores with the advantage that you can select your merchandise without leaving your own home.

Reports on the Serious Coal Problem

THE letters which follow will give you some indication of what prevails in all sections of the country on the very serious fuel

situation. The only thing that has saved people from disaster this winter, worse even than it was last year, is that the winter so far has held off and there is some promise that the weather will be mild all during the season.

What is to be the solution of this fuel problem anyway? It is, of course, nearly as much of a problem to farm people as it is to city folks, for most farmers are obliged to burn coal. You will note in these letters references to prices of cord wood. Not so many years ago we sawed wood which was sold for a dollar a cord. Now not only is it too high to burn as a fuel, but most of the trees ought not to be destroyed for fuel anyway. In addition to the labor and strike problem which has had much to do with the high prices of coal, there is the fact that the end of coal is in sight, which means that within a very short time some real substitute must be found for it.

Evidently, judging by these letters, in addition to the extra price which was added at the mines when the quarrel between the miners and the operators was settled, several more profits have been increased this year before the consumer is privileged to buy.

The interesting letters follow:

"The coal dealers of this town have practically no domestic (Continued on page 428)

BUY CHRISTMAS SEALS

SECRETARY WALLACE buys Christmas seals from Elsie Behrend and says: "I am delighted to express appreciation to the National, state and local tuberculosis associations for the excellent work they have done in teaching the children in the farming and rural areas of the United States to become Modern Health Crusaders. I shall Christmas seal all my Christmas mail this year."

much correspondence he received three does, but no buck, and the does were just plain ordinary rabbits."—W. J. W., Massachusetts.

This letter goes on to explain at some length how this poor farmer boy finally lost \$20 more to this company for which he received no value.

Here are a couple of letters as samples, showing how our folks appreciate what we are doing:

"I have received a copy of AMERICAN AGRICULTURIST of November 17th with a front-page story regarding the Standard Food and Fur Association. Publicity of this kind should do the trick almost as good as the courts of law. In many cases like the fur association it no doubt is impossible to invoke the law."—H. F., New York.

"I have just been reading the AMERICAN AGRICULTURIST magazine. I enjoyed 'Heads I Win, Tails You Lose' very much. The farmers (myself included) should certainly appreciate your efforts to protect them from criminals."—Mrs. F. S. S., New York.

Still another letter says:

"I was very much pleased at the expose you made in the last issue, of the Standard Food and Fur Association. It is outrageous that such an organization should be allowed to continue in business and to use the mails and newspapers for advertising. They have swindled people by the hundreds all over the United States and apparently take up one section at a time until the people find them out then move on to another."—H. J., New York.

Another writer was kind enough to say:

"If all publishers would do as the AMERICAN AGRICULTURIST

American Agriculturist

Cooperation Is More Than Marketing

A Wednesday Evening A. A. Radio Talk Broadcast from WEAJ

PASSING back for a moment into the earlier days of agriculture in the United States, we might roughly classify the progress of agriculture into five stages. First there was the pioneer stage. The farmers produced and marketed their products and regulated their home and social life entirely on an individual basis. This was a period of self-sufficing economy. The farm not only fed but clothed its workers. Contact with business as we now know it was slight. Then we came to the period of development, when with the growth of larger communities the matters of rural interest slowly centered, although farmers and their families were still largely individualistic.

Later came the period of invention and the application of such inventions as the mowing-machine, the binder and such power farming-machines as tractors, reapers and threshing machines. A few years ago we reached the stage of specialization, and this is still pronounced to-day by our great cotton, tobacco, wheat, potato, apple and live-stock areas. Now we find ourselves well into the present stage of agriculture—the cooperative stage—when our farm life is cooperative in thought and action on the bigger problems of the day as well as cooperative in the buying and selling of farm supplies and farm products. This is as it should be. With the passing of the successive stages, it has become more and more apparent to farmers that individual action, except in matters of production, could not give to agriculture as an industry the true expression that it of necessity must have.

The progress of cooperative marketing is indicative of cooperative thinking and acting on the part of rural people which is typical of the newer stage of agricultural development. Necessity is the mother of cooperative organization and to that incentive we owe practically all of our successful cooperative associations. Along with the strong commodity associations in New Jersey—brought into existence because its members realized that they must reduce the waste in marketing in order to make a living—we find that this same spirit is being manifest in the attack on other farm problems. Cooperative marketing associations such as our Jersey Fruit Growers' Cooperative Association and the Atlantic Coast Poultry Producers' Association are ventures into the business field. They have been quite successful. The fruit-growers and the poultrymen have for the most part received a better return for their labor and by the reduction of waste in the marketing methods they have made more equitable prices for consumers as well as for themselves. The consumer always gains when produce of mediocre quality stays home.

This success in cooperative marketing, however, carries with it as indicated before cooperation in thought on other, and sometimes more important, problems in the development of a better rural

By LOUIS A. COOLEY

Secretary, New Jersey Federation County Boards of Agriculture

life. There are the problems of rural education, equitable taxation and proper representation of farmers' interests in the legislature, which are now being considered. The experiences in cooperation in the selling and buying field have brought the farm men and women to an understanding of mutual problems which was unknown in the earlier stages through which agriculture has passed in this country.

Take, for instance, the one important subject of

extent which will mean a more progressive and happier home and a finer community life for our non-urban citizens. This will react to the benefit of all classes of citizens in America.

We might mention a similar development of farm public opinion which is slowly and surely coming about on the subject of taxation. I might quote a hundred official investigations which show the inequalities in taxation and which further show a divided opinion among farmers on this important subject. The spirit of cooperation which has helped our farmers to pool their opinions as well as their crops is now showing itself in unified thought towards just rates and

equitable taxation for all classes in accordance with their business and ability to pay. What has been said of taxes applies as well to freight rates.

This concentration of thought and action has already become apparent on legislative matters in recent years. In New Jersey and other leading States, and subsequently in Washington, united effort on the part of farmers was entirely responsible for the passage of legislation that prohibited the use of vegetable oils as a substitute for butter fat in the manufacture of condensed and evaporated milk in spite of powerful opposition by the manufacturers. This was of mutual benefit. It increased the sale of real milk. It increased the nutritive value of milk products, protecting the consumers, chief among which are the younger generation. Similar action secured protection from adulterated ice cream in New Jersey.

Wise farm public opinion will always give the greatest good to the greatest number. Referring for the moment to the cooperative selling movement, take for example the

Jersey Fruit Growers' Cooperative Association. The membership represented this last year 10 per cent. of the commercial peach production in the State. Three years ago the members of this association sold their fruit individually and upon whatever market and to the dealer that met their convenience or pleasure. They pooled their knowledge and their strength for the marketing of a finer grade of fruit and the policy of that organization is a cross-section of the thought of those cooperating.

The same thing might be said for the Atlantic Coast Poultry Producers, the membership of which represents 285,000 laying hens in New Jersey and adjacent States. The policy of that organization is an index of the thought of the poultrymen who own this tremendous number of hens.

The farmers, who have expressed that satisfaction which comes from united action, will not stop here. It is not human nature to do so. Thus it can be seen how easily the same line of reasoning is being carried through to the consideration of their homes, school problems, taxes and legislation. A coherent farm public opinion on the matters of the day is now coming to be a reality.

"Later came the period of invention . . ." bringing with it the tractors to replace horses and oxen, and mechanical loaders to eliminate back-breaking hand methods.

rural schools. The country cross-roads school where our forefathers secured their education is still in existence in many sections, although perhaps not so much in evidence in New Jersey as in some of the more sparsely populated States. However, the people in the cities unconsciously cooperated years ago in providing the means to give their children a better education. As cities grew in size, the inhabitants were compelled to find a way to educate the ever-increasing number of children. They were forced unknowingly to be efficient.

In the country small school-houses and old methods of teaching are still in effect. The necessity has not been as keen for new school buildings or other educational necessities, including teachers and equipment, as in the case of our city friends. Cooperation in this way in the cities has developed an excellent school system for the city boys and girls, until now we find the advantages enjoyed by the city people are greater than in our rural districts.

This same cooperative experience has kindled a community feeling which is showing itself in a united farm public opinion for better schools. It will carry its lesson in the years to come to an

When Farmers Fight One Another

"I KNOW that you are familiar with the milk situation. I wish that we as producers might get a little better understanding through the AMERICAN AGRICULTURIST of the milk problems. In 1916 the Dairymen's League was formed for we believed that there was too large a spread between what the consumer was paying and what the producer was getting for his milk. Today the difference is greater than ever. I feel positive that the enormous profit which the dealers are allowed to make for their fluid milk is the reason why the non-pool dealers exist."

"When the Dairymen's League Cooperative Association dropped the price on November 12 65 cents per hundred pounds and Borden's cut the price one cent a quart to the consumers (46 cents a hundred pounds) what happened to the other fraction of the drop?"—L. J. H.

THE above is a sample of the letters AMERICAN AGRICULTURIST is constantly receiving on the milk situation and of the thought that is going through practically every dairyman's mind in this territory.

The Dairymen's League Cooperative Association price to dealers for December fluid milk is \$2.80 per hundred for 3% milk or \$3.08 for milk containing the average amount of butterfat of 3.7%. This is only a little over 6½c a quart to the farmer, and of course this is only the price of Class 1 milk. The farmer's pool price would be much less than this. Grade B bottled milk delivered in New York City in December costs the consumer 15c a quart. Therefore, the spread between what the consumer pays for bottled milk and what the farmer gets is approximately 8½c a quart. About half of the fluid milk used is sold in bottled form. In fairness it should be stated that the spread on the loose milk is considerably less. But even taking this into consideration, together with the greatly increased freight rates, labor and other delivery charges which the dealer must pay, we believe our farmer correspondent is right when he states that the profits of most of the dealers are the highest they have ever been. In fact, some of the dealers' financial reports to their stockholders bear out this statement. Even before the days when the farmer was organized, during the period of 1910-1914, the average December price for these four years for milk testing 3.7% butterfat was \$1.95 per hundred, or about 4c a quart. This was a very low farmer's price, to be sure, but do not forget that during that time the consumer never paid

over 8c a quart so that the dealer's spread between producer and consumer was only 4c.

Then there is that other question raised by our correspondent and by thousands of other farmers as to why, when the consumer's price is lowered, the farmer's price is nearly always lowered still more. For instance, the price of Class 1 milk was lowered by the League from \$3.45 to \$2.80—a drop of 65c a hundred pounds—but the consumer's price was dropped only a cent a quart, or 47c a hundred. In most cases distributor got this difference of 18c a hundred except where the milk was handled in the farmer's own plants. This is but another instance of the great harvest that the dealers are constantly reaping by this unfortunate division among farmers and among their organizations. Farmers should not blame the dealers either. They are merely better business men in this case than farmers are. They know that it pays to stick together. In no business in the world is there more bitter competition than between rival milk companies in the same city. Yet when it comes to dealing with farmers, the milk buyers know that it is good business to present a united and organized front which they do through the dealers' New York Milk Conference Board. The Borden's and Sheffield Company, the two largest milk distributors, are in the strictest competition in the city. One of them patronizes the pooler producers and the other the independent producers. Yet it is highly significant that they both belong to and work with the same organization, the New York Milk Conference Board.

But when it comes to farmers whose every interest lies in cooperation and in working together, we have an entirely different story. The League, the largest of the four producers' organizations in this territory and one or two of the smaller organizations have been doing what they could working independently to get the farmers a fair price for their milk, but there are after all only about 43,000 actual poolers in the League in competition with probably at least 80,000 other producers in this territory so that when all is said and done, the work of any one of these fairly small organizations is comparatively insignificant when compared with what might be done were they all working together. And the dealers with their good business sense well know their good profits will continue as long as they can succeed in keeping the farmers divided and more interested in competing with one another and in laying the blame for their troubles upon one another than they are in getting together into some kind of a real federation or conference board that could meet the dealers on their own ground.

Christmas 1923

HOW the years race by, don't they? To most of us, it seems only yesterday when Father and Mother helped us hang our small stockings while we went reluctantly to bed, impatiently to await the coming of Christmas morning. Yet to many of us it is getting to be quite a spell since those happy days twenty-five—or was it fifty—years ago. It is so long, in fact, that the pressure and worry of worldly affairs have made some forget the real spirit of Christmas and the joy of the kiddies in this, the finest and best of our holidays.

It does not take a lot of money or expensive gifts to make a merry Christmas for the youngsters or for ourselves, but it does take a turning back or a forgetting of the years so that by remembering the joy of our own Christmases of long ago, we can live them over again with almost the same eagerness and joy with our friends and our children in this year of our Lord, nineteen hundred and twenty-three.

We have a couple of married friends well past the half century mark, whose children have long since gone to make homes of their own, but who still preserve the eternal Spirit of Youth by hanging their stockings on Christmas eve and by erecting a little Christmas tree on their hearthstone.

We can make no finer wish for you this Christ-

mas season than that no matter what your years are you may get and preserve this Spirit of Youth, so beautifully expressed by Oliver Wendell Holmes, in his poem called "The Boys".

Has there any old fellow got mixed with the boys?
If there has, take him out, without making a noise.
Hang the Almanac's cheat and the Catalogue's spite!
Old Time is a liar! We're twenty to-night!

Yes, we're boys—always playing with tongue or with pen;
And I sometimes have asked, Shall we ever be men?
Shall we always be youthful and laughing and gay,
Till the last dear companion drops smiling away?

Then here's to our boyhood, its gold and its gray!
The stars of its winter, the dews of its May!
And when we have done with our life-lasting toys,
Dear Father, take care of thy children, THE BOYS!

For "Dollar Maker" Chick Letters

OUR "Dollar makers" have created much interest. We are sure that our readers who will follow some of the suggestions will save a good many dollars.

It will soon be the time to think about the baby chicks again and it has occurred to us that some "dollar maker" letters from our readers from their actual experiences in hatching and rearing chicks would be of great value to all those interested in this great farm industry. After all, experience is the best teacher and we think we can render the most help to you by passing your experiences back and forth.

Therefore, we will pay a dollar for every good letter not too long giving definitely your experience in hatching and rearing chicks. Letters will not be acknowledged or returned, but those that are accepted will be paid for upon publication.

Saving the Evergreens

ERECTING the annual Christmas tree is one of our nicest customs, but in its observance, may we suggest that great care be made in selecting the evergreen that has no opportunity of some day becoming a great tree and that some careless youngster may not mutilate a large tree by cutting out the top. Sometimes we Americans who have been so prodigal with our forests are going to wake up to the fact that the tree is one of the most priceless of Nature's gifts to Man.

Eastman's Chestnuts

THINKING of the campaign now on in many States to renew and increase the memberships of county farm bureaus led me to recall the old story that the boys used to tell when the farm bureau men gathered at conferences.

It seems that County Agent Bowen was just newly elected in the early days of the farm bureau work in Wyoming County, New York, and in one of his first trips out to the farms to get acquainted, he had quite a long visit with a farmer, without giving his name or his job. Near the close of the conversation Mr. Bowen said:

"By the way, do you ever make any use of the farm bureau?"

"Naw," said the farmer, "wouldn't have one of them confounded new-fangled contraptions on the place!"

Recently, another farmer—a Scandinavian—up in North Dakota, took out a membership in the farm bureau. About six months later the Department of Agriculture, at Washington, received the following letter from him:

"I bane sign up for your farm bureau. Not yet received it. Schoolmarm she have want board at our house and wife wants bureau for spare bed-room. For why you not send it yet? Tell me."

He received the following letter in reply:

"Dear Sir: Yours of 23 inst. to hand and beg to say that we have no bureaus in Washington that we can send out at the present time. However, we have an "A 1 Farm Bloc," and as soon as we lay our hands on it, we will have it sawed up, made into a farm bureau and sent to you."

Let's Hear About The State Police

Other Letters on the Federal Land Bank and the Country Church

I HAVE always been whole-heartedly in favor of rural police protection, because it constitutes a much-needed innovation. The theory is certainly excellent and the present State troopers should solve the problem. But somehow it proves to be a theory, like many others, that fails to work out in actual practice. It may be that the force is inadequate in numbers but that fact could in no wise affect some of the adverse criticism to which it is open. Perhaps we hear of the failures rather than the successes, too, and there may have been extenuating circumstances, of which no one hears, that would in a measure excuse the faults of the system. But the fact remains that, for the purpose for which rural people supposed it was originally intended, our institution has fallen far short.

We expected them to serve in country places rather than in large cities, where their activities seem to have been confined largely to quelling strikes. Last Hallowe'en, in a place where much damage had previously been done and trouble was expected, it is reported on the best possible authority that a trooper stood by while the lawless element threw stones through windows and committed various other depredations, and not only did the representative of law and order neglect to make any effort whatever to prevent these things but he told the law breakers that he would "wink at them," he wasn't seeing anything. It is rare indeed that we manage to get a trooper when he is needed and I have yet to hear of a case where his services, when they were obtained, were not against rather than for the rural population.

A case is on record where one of the troopers arrested an old woman over eighty years old, who lived entirely alone, and the court fined her \$50 for having in her house a revolver that had belonged to her husband and had not been a usable weapon when he died twenty-nine years before. No doubt the story "gained some in the telling" but it indicated the general trend of rural thought toward or about these protectors of country life and property. The law that prohibits the revolver is in itself an absurdity, since it is a self-evident fact that it would in no wise disarm the criminal while it leaves the law-abiding citizen entirely at his mercy by removing his only means of self-defense.

I may not see these things in their proper light and if I do not I should be very glad to be corrected, but it looks to me as if the rural police had failed sadly to comprehend its true mission. I should say "more and better protection," yes; but more State troopers of the present type no.—E. M. A., Chautauqua County, N. Y.

EDITOR'S NOTE—Here is what one farmer's wife thinks of the State Police—What do you think? Let's have a few short letters.

* * *

Loans Depend Greatly on Location

I have bought a 100-acre farm. It has 12 acres of good hemlock timber, but I am not allowed to sell any wood or lumber until paid for. I paid \$2,200 and it needs quite a lot of repair on buildings and needs a granary and hog pen. I wonder if I could get any help from the Federal Land and Intermediate Banks. Please write and let me know what you can about it, because I would like some help if I could get it.—W. W. C., New York.

YOUR letter to the AMERICAN AGRICULTURIST has just reached me. I am sorry that you do not give data enough to enable me to make even an intelligent guess as to whether or not the

By A. A. READERS

Federal Bank can let you have the amount of money you need. There are always a good many different factors to be considered. If your farm is fairly good land, reasonably level and free from stone, with fair buildings and favorably situated—by that I mean not far from a railroad station and improved road—I think it likely that it would be appraised for as much as \$4,400, in which case the Bank might loan \$2,200. If your farming appeared to be well conducted and on a paying basis with a proper amount of live-stock, it would be a factor greatly in favor of a liberal loan. Where the buildings are poor or the farm lies remote from lines of transportation, the Bank

(i.e. its borrowers) it must try to never make loans in excess of the prompt and certain sale value of the farm. This is the reason why they ordinarily loan only 50% of the appraised value. Occasionally at least good farms when thrown on the market in foreclosure proceedings go unbelievably low.

No matter what an appraiser may think, a recent bona fide sale is the very best measure of actual value, so if you have paid only \$2,200 for the farm and have paid only a little in cash, it would seem unlikely that you could get enough from the Bank to take care of the mortgage. Then, too, the Bank can take nothing except a first mortgage and if your mortgage is not yet due and the holder declines (as sometimes happens) to accept payment, you might not be able to arrange the matter. You see there are many things to be taken into consideration. Personally I wish that the Bank might be able to help you and every other worthy man but knowing nothing as to conditions it is not wise for me to make anything more than a vague guess.—JARED VAN WAGENEN, JR.

A Country Church Centennial

ONE hundred years ago a little group of Scottish immigrants built a church in the open country. Their descendants, who recently celebrated the centennial of the founding of the church, gathered in a beautiful edifice of stone, which many years ago took the place of the original plain wooden structure. The church building of to-day, like that of the past, faces the sunrise, a symbol of the forward look of those who worship here; while the spire, which rises high into the blue, is not only a landmark but the architectural expression of the aspiration of the countryside.

Five or six score of members is the most that the old church has ever had at any one time, but it has always been a kind of community fireside about which the scattered farm dwellers could gather as a big family. Here they have discussed their problems, shared their experiences, inquired after the sick, voiced their sympathy for the bereaved, and here with deep feeling they have sung, "Blest be the tie that binds our hearts in Christian love."

But, most important of all, during its one hundred years this church has kept alive and quickened that sense of responsibility to God which Daniel Webster, country born and country bred, declared was the greatest thought which ever filled his mind. Those who have here bowed the head in prayer, week by week, who have studied the Book of books, and who have reverently listened to the message of a man of God in the pulpit, have come to realize that the world has a sky and that the height of life is of even more moment than its length and breadth. Young people who have here gained inspiring interpretations of the faith of their fathers have greatly resolved, that, whether in the country or in the city, they would live their lives like young John Milton, "as ever in my great Taskmaster's eye."

From far and near men and women came back to the centennial of the church of their childhood and youth. They came back as the alumni of a college return at Commencement. They felt that the old church was their spiritual Alma Mater. Gladly they confessed that all that was best in their lives came from their God-fearing fathers and mothers and from the old home church.—J. E. R., Broome County, N. Y.

All Set For the Annual Operation

Courtesy, New York Tribune

is unwilling to make loans except upon a basis of low valuation. If you had given me an idea of the general character and lay of the land together with the exact location or distances from railroad and stone road I might have been able to give you at least some idea of the value.

In regard to the woodland I may say that the Bank has no hard and fast rule, but in a general way they are willing to allow lumber to be cut and sold providing a part of the proceeds—say one-half—is turned into the Bank for the purpose of reducing the loan. I do not think you would find them unreasonable in this regard.

If the loan is to be used for permanent improvement which would add to the sale value of the farm the loan might be more liberal than if it was to be used merely to pay off indebtedness. I may add that sometimes loans are made only upon condition that at least a part of the loan is so used, and not infrequently such money is held in trust by the Secretary-Treasurer of the local Association and is paid over only as it is actually applied to such improvements.

Unfortunately the Bank can not be wholly a philanthropic institution. If it is to continue in business and be fair to its present stockholders

UNADILLA SILOS

THERE are good reasons why more Unadilla Silos are sold each year than any others.

They cure and keep silage better. They keep upright, air-tight and repel frost. They are easiest and safest to use. Unadillas are known by their famous safety door front ladder.

This is the time to arrange for your Unadilla. Early orders now, while our factory is not rushed, earn the biggest saving we ever offered.

Write to-day for the big Unadilla catalog, early order discounts and agency offer for open territory.

OIL LIGHT BEATS ELECTRIC OR GAS BURNS 94% AIR

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

CLOVER CHEAP

Samples Free—with lowest whole-sale prices. We expect much higher prices later. We can save you money on best tested seed. We bought early big stocks on lower markets. Our prices amazingly low. How To Sharpen and Set a Drag Saw

The First of a Series of Three Articles on Filing and Setting Saws at Home

By L. M. ROEHL

BEFORE one can sharpen a crosscut saw well he must have in mind the desired shape of the teeth he is filing so as to get them the same shape as made at the factory or some other shape definitely suited to the kind of work the saw is to do.

Figure 1 illustrates the work done by the cutting teeth and the rakers of a crosscut saw. The drawing shows four cutting teeth between two rakers or drag teeth. Two of the teeth, A and B, are filed so that the points of the teeth make a cut like a knife cut at the right side of the saw kerf and the other two, C and D, at the left. Each raker has two square points like a wood chisel. One point draws the sawdust or "worms" out in one direction and the other in the opposite direction.

Figures 1, 2 and 3 show three styles of teeth filed for general use. Figure 1 shows a style

called lance tooth and has four cutting teeth between each pair of rakers. Figure 2 shows a style called regular tooth. This has no rakers, each tooth doing its share of the clearing. Figure 3 shows a style called champion tooth which has two cutting teeth between each pair of rakers.

A saw to cut well must meet the following requirements:

1. All cutting teeth must be the same length so that each tooth will do its share of the cutting.

2. The cutting teeth must be filed to a point.

3. All rakers must be of a uniform length.

4. The rakers must be of the same length shorter than the cutting teeth and the distance suited to the kind of wood the saw is to be used in.

5. The gullets or spaces between teeth and rakers must be deep enough to house the wood in the saw kerf which is loosened by one stroke of the saw.

If the gullets are too small to carry out all the sawdust or "worms" that is loosened by one stroke, the first operation in fitting the saw is to make larger spaces or gullets between the teeth and rakers. This is called gumming the saw. This may be accomplished by a round or a round back file, which, however, is a slow and laborious way. A better way is to grind it out with a high speed grinder. An emery grinder which is about $\frac{3}{8}$ inch thick is well suited to the work. To do this, a platform needs to be provided so that the saw may be placed flat in front of the grinder and fed against the grinder at about its center. The saw should be fed against the stone very lightly because forcing it may break the grinder or heat the blade of the saw so as to draw the temper. It is a good way to grind a little in one gullet and then move the saw on to the next and the next and then go back to finish up the first gullet. If a little filing is done in the gullets with a round or round-back file each time the saw is filed, the teeth can easily be kept their proper length without much filing at any one time. This is a good practice for those who do not have access to an emery grinder.

Figure 4A shows an actual drawing of a saw as it had been used. It may be noted that drag tooth No. 1 is more than 1-16 inch shorter than the cutting teeth and drag tooth No. 2 is about 1-32 inch longer than the cutting teeth.

The points of the teeth and rakers had been filed many times but not the gullets so that not enough space remained in the gullets to house and carry out the saw dust. In fitting the saw, it was gummed as shown in Figure 4B with a $\frac{3}{8}$ inch emery grinder.

The second operation in fitting a crosscut saw is that of jointing the saw. This consists of running the side of a flat file lengthwise over the points of the saw teeth enough times to bring all teeth to a line. When the point is filed from a tooth, it leaves a small, smooth

shiny surface which may be readily seen by placing the saw in front of a window or some other place where the light will shine on the point of the tooth.

A tool called the saw jointer or crosscut saw fitting tool is very desirable and almost necessary for jointing the saw and filing down the rakers. Figure 5 shows such a tool in use jointing a saw. A flat file is held in the tool at a right angle to the side of the saw and run over the teeth with forward strokes of the file until all the teeth have been touched with the file. The teeth, being large, make it difficult to hold a file in the hands as is done in fitting hand saws.

The next step after the saw is jointed, that is, when all the teeth have been filed down to the level of the lowest tooth, is filing down the rakers. This operation is illustrated in Figure 6. The crosscut saw tool is placed on the saw so that the points of a raker project up thru the slot in the tool and all of the point of the raker that sticks up thru the slot is filed off. Soft wood requires more clearance for the rakers than hard wood. For cutting hardwood, the rakers are filed down from 1-64 to 1-40 of an inch shorter than the cutting teeth. A hacksaw blade is about 1-40 of an inch thick. For softwood from 1-40 to 1-32 of an inch is satisfactory.

When the rakers have been filed down to the right distance below the cutting teeth, they need to be filed to a point. The filing is done on the inside of the raker, straight across the end. A flat file is most satisfactory for this work. The rakers should be filed so as to have square corners at center as shown at C in Figure 4B.

The next step in fitting the saw is that of filing the teeth. Every other tooth is filed from one side. The position to hold the file depends on the shape and length of point desired. If the saw is to be used in frozen timber which has considerable knots, and strength is required in the teeth, a rather blunt point is desirable. If the saw is to be used in softwood where strength of teeth is not so essential, a longer point may be filed. To obtain a long point, the handle end of the file is held low and to the right or left depending on which side of the tooth is being filed. Full light strokes of the file are most satisfactory for the work. Files cut on the forward stroke only and so the file is raised from the saw at each stroke. The point which is being filed needs to be watched closely at each stroke to see that the point is brought over the center of the tooth and that the filing stops when the point has been reached.

The next step in fitting the saw is that of setting the teeth. The purpose of the set is to make a saw kerf in the wood which is wider than the thickness of the blade of the saw so that it will not bind in the wood. Wet and green wood require more set than hard or dry wood. Not more than $\frac{1}{4}$ of an inch of the point of each tooth is set. Some practical wood filers set less than 3-16 of an inch of the points, maintaining that the saws draw easier

and cut better after the keen point has been slightly worn off by use of the saw. Success in setting crosscut saws depends largely on the kind of tools one has for the work. Best results are obtained with a hammer set or a hammer and setting block. A very satis-

Fig. 7.—Home-Made Setting Block

factory setting block may be made from an old sadiron or a block of metal. Figure 7 shows such a block. One corner of the block is filed off $\frac{1}{4}$ inch back from the edge on the side and down on the edge the thickness of a hacksaw blade. The saw is placed flat on the metal block in such a position that the point of a tooth projects past the shoulder $\frac{1}{8}$ inch, 3-16 inch or $\frac{1}{4}$ inch depending on the amount of set desired and struck firmly with a light hammer at the point indicated in the drawing.

CONSIDER THE LOG AND BUZZ SAW

H. H. LYON

THE fuel situation was something worth mentioning on many farms last winter. Townspeople had trouble in getting coal and occasionally they have been as short as a day or even a few hours, but in our up-State towns I heard of little real discomfort from lack of coal. Occasionally some of the residents bought wood from farmers for a part of the fuel supply and some have quite a reserve on hand. On the farm, however, there was usually plenty of wood if one could get it out. Townspeople seemed to think that that was no problem, but in a number of instances it was difficult. There was no help to be had except by changing work, and there is a lot to do to care for the stock and keep business going. Not a few farmers were just able to keep a short jump ahead on the fuel question.

We have been saying for some years that a farmer who has a gasoline engine can hardly afford to be without a buzz saw. I am not sure but that is true unless two or more farmers can use one saw. With heavy timber to cut into wood the buzz saw is, in some cases, of doubtful value. A drag saw is better for such wood. If one neighbor can have the drag saw and another a buzz saw, and then exchange with each other, that may be a better proposition. I hadn't thought so much about it until recently. I have watched the old-time drag saw and thought I would like one, but the more recent kinds are worth much more. They operate the same way, but they are made to cut faster. Then they have an attachment by means of which a lever can be shifted to make the device do different things. If in the middle the machine is neutral and does no work, yet the engine need not be stopped. Swing the lever to one side and the sawing begins, or if swung to the other side the log is advanced slowly without any work on the part of the operator. It is all done by moving the lever when once the log or the tree has been placed in position. It is worth looking after. Coal is to remain high and farmers are likely to use wood to a considerable extent for the near future at least. We cannot buy much machinery these times, but occasionally something will be purchased, and this is something to consider.

Fig. 5.—Jointing the Saw

Fig. 6.—Filing Down the Rakers 1-64 to 1-32 According to Kind of Wood

A woodlot is a wonderful asset these days. Many of our steep hillsides, now bare, would be decidedly more productive bearing timber such as this under careful cutting plans

The Outlook in the Seed Market

Reserve Supplies Are Low—A Seasonable Fruit Note

THE 1923 crop of timothy seed is one of the smallest in yields that has been harvested in a number of years—in fact the supply of timothy seed available for spring sowing is about 70 per cent. normal, while the quality in general is only average.

The fall of 1922 was very dry and the timothy plants in the West did not develop good roots. The spring of 1923 was cold and wet which caused the crop to be about three weeks late all during the season. The above conditions would not permit a high yielding

By A. L. BIBBINS

present time, and should the exportations continue, such might make quite a bullish factor in the market.

Active Interest in European Clover Seed

With our American crop of Red Clover seed about 45,000,000 pounds less than last year, American seedsmen are turning their attention to the European supply of seed. Undoubtedly a great deal of seed can be brought from

our crop is very short and consequently feel that they can obtain pretty good prices for their seed. On the other hand, American importers know that the Europeans badly want the American dollar and with the rates of exchange so strongly in favor of the American dollar more seed can be purchased to-day with our dollar than was possible a few months back. The wise farmer will not purchase the European seed at any price as it is not well adapted to our northern conditions. Some will have to take it or go without because of the shortage of strictly northern-grown domestic seed.

PUTTING SMALL FRUITS TO BED

BY DAVID STONE KELSEY

FOR more than twenty years we struggled along with about average success in wintering our raspberries and similar small fruits, following the direction of experts about as did the Jap cook, whom his mistress found throwing away a newly broken, perfectly good egg. When questioned, his alibi was that in first showing him how to mix that cake, she had thrown away the first egg, and had often told him sternly to do exactly as he had seen her do.

But accidentally I one day learned the principles of winter protection, since when we have scored about 100 per cent. success. It was in a summer after a winter so severe that very few raspberries or even blackberries had wintered through and were fruiting. But going across-fields I came across some red raspberries in a low fence-corner that were loaded with ripening fruit. Then and there was studied out this victory over the cold—there canes stood even lower than the last year's golden-rod and other perennials whose friendly "shade" and snow-holding influence had saved them from both dry-freezing and sudden thaw.

At the Fruit Show last month, the Hudson Valley cooperatives were much in evidence. In the foreground is the exhibit of the Hudson River Fruit Exchange, with the Clintondale Cooperative in the background. The producers of Storm King brand were also represented as were several individual growers.

crop so the supply of seed was certain to be affected to some extent directly from the weather conditions.

Last spring farmers throughout the West fed hay about three weeks longer than usual, as the season was so late that stock could not be put out to grass. The extreme consuming period lowered the stock of hay on the farms and made it more necessary that all hay available from the 1923 crop be harvested.

Just before harvesting, the market for hay was very strong—in fact it still remains strong. With the timothy fields in such States as Iowa, Minnesota and Dakota showing a very poor prospect for seed, and with hay bringing a good price it is only natural that farmers should cut a greater acreage than usual for hay. This resulted in less acreage being cut for seed and the yield of acreage cut was not up to normal, consequently the supply of seed harvested from the 1923 crop was about 30 per cent. less than normal.

Some years the short crop is off-set by a carry-over of old seed, however, there was almost no carry-over to make up for the shortage, as the previous year's crop was not overly large and in fact, had to be helped out by a carry-over of old seed. There is some old seed on the market, much of which shows a very inferior germination test. This probably will not reach the farmers in its present state as most houses owning any of the seed would not care to ship out such low germinating seed.

Europe as some sections have quite a large supply but it is not thought that enough can be obtained abroad to more than make up half of our domestic shortage.

Up to date, over 2,800,000 pounds of Euro-

The feature of the Champlain Valley exhibit at the Fruit Show, put on by the Clinton and Essex County Farm Bureaus and representing several individual growers, was the deeper color of the fruit. New England showed no deeper color.

pean seed have arrived at the Port of New York and it is thought that this represents about 12 per cent. of Europe's surplus clover seed. In addition to the seed received at New

Two Conditions That Kill

There are just two killing winter conditions that get between the small-fruit grower and success; persistent zero gales that literally freeze dry and so kill the berry and grape canes, and the diametric opposite of this, too sudden thawing after intense cold. The latter accounts for most of the dead strawberry crowns found in spring, though sometimes careless owners permit surface water to smother them with ice.

But if perfect surface drainage and sufficient coarse shade protection be provided, neither the sudden thaw of a clear February sun on a still day after a zero night (which thawing ruptures the tiny germ-cells of the tender, growing parts) nor the smothering ice-sheet of March need be feared. No moist, shade-protected cane will ever be injured.

When to Mulch

Any time between ground freezing and the first snow, we mulch (always on frozen ground—never on snow or mud) with plenty of very coarse, stiff material, other than manure, forest leaves or pine-needles—preferably plain common corn stover, though sometimes pea or potato haulm, barley or rye straw, oat straw or buckwheat tend to smother, which is the chief objection to forest leaves and pine needles, while stable manures bring weeds and grass-seeds.

However, for taking care of currants, gooseberries, shrubs, new-set hedges, asparagus seedlings, and any other young stuff still in the nursery-row, a combination of corn-stalks and light, curly forest leaves is about ideal. Also every one of the items objected to above make

can make your hides into Oak Tanned
Hides or Slaughter Sole or Belt Leather;
your calfskins into Shoe Leather.
Colors, Gun Metal, Mahogany, Russet or
lighter shade. Calfskins tanned in the
lighter shades of shoe leather, also
make elegant stand and table covers;
great for birthday, wedding and holi-
day gifts.

LET US FIX YOUR WORN FURS

freshen, repair and reshape them if
needed. Furs are very light weight,
therefore it would cost but little to send them in to us
by Parcel Post and get our estimate of cost; then we
will hold them aside awaiting your decision. If you say
"go ahead," very well; we will do so and hold them
free of storage until you want them. If you say "no,"
we will return them post-paid.

Our illustrated catalog and style book combined gives
a lot of useful information. It tells how to take off
and care for hides. About our safe dyeing process on
cow and horse hides, calf and fur skins. About dressing
fine fur skins and making them into neckpieces, muffs
and garments. About taxidermy and Head Mounting.

The Crosby Frisian Fur Company,
571 Lyell Ave., Rochester, N. Y.

WE TAN THEM—YOU WEAR THEM

Let Her Wear Your Trophies

How much more the coats, scarfs, and
stoles will be enjoyed by Her—your wife,
mother, sweetheart, sister—how much less
the cost will be when the fur garments are
made up direct from your own pelts—coon,
fox, skunk, mink, muskrat, squirrel, etc.

All kinds of garments made from any kind
of skin suitable for the pur-
pose—stylish garments,
warm and durable, made
to your order.

News From Among the Farmers

League Announces November Pool Price \$2.43—Washington News

THE Dairymen's League Cooperative Asso-
ciation announces the gross pool price for
November milk is \$2.43. From this price there
will be deducted 10 cents for expenses, leaving
a net pool price of \$2.33. Of this amount the
Association will borrow 10 cents per 100
pounds on certificates of indebtedness leaving
a net cash price to farmers of \$2.23.

The net pool price of \$2.33 is one cent per
hundred better than the price received for
milk in October. This is rather unusual in
view of the fact that during November a price
reduction of 65 cents per 100 pounds was
made by the League. The officials of the
League state that the increase in price is due
to the fact that when the price was decreased,
the amount of business increased tremendously.
Furthermore the fact that the League is han-
dling all surplus in its manufacturing depart-
ments, also helped to keep the price to the
farmers up.

BRADFUTE REELECTED PRESIDENT A. F. B. F.

AT the annual meeting of the American
Farm Bureau Federation, which was
held in Chicago, December 10, 11 and 12,
O. E. Bradfute of Xenia, Ohio, was reelected
president. A more detailed report of the
Federation meeting will be given in next week's
issue of AMERICAN AGRICULTURIST.

NEWS FROM WASHINGTON

SINCE the new Congress opened its session
on December 4th, it has been very busy
trying to organize itself and in listening to the
messages from the President and reports from
other national officers. In both the House and
the Senate controversies have developed be-
tween the progressives and conservatives of the
Republican party which delayed real work.
In the House, the progressives held up the
election of Speaker Gillette and the organiza-
tion of the House until they could get assur-
ances that the rules would be so revised as to
give more opportunity for consideration of
progressive measures. In the Senate, the fight
developed over the reappointment of Senator
Cummings as chairman of the Inter-State
Commerce Commission.

During the early days of the session, the
President sent over two thousand appoint-
ments to important government positions to the
Senate for confirmation. The most important
of these was the appointment of Frank B. D.
Kellogg, of Minnesota, as Ambassador to Great
Britain. After a sharp debate, this appoint-
ment was confirmed by the Senate by a vote of
75 to 9, the opposition coming chiefly from
progressive Republicans.

Tax Reduction in Foreground

A topic that is receiving the greatest atten-
tion both in Congress and out is the question
of reduction of taxes, as proposed by Secretary
of the Treasury Mellon, and advocated in the
President's message. There seems to be an
overwhelming amount of sentiment through-
out the nation for this reduction. But the
President has made it plain that the reduction
could not be made and at the same time pay
the soldiers' bonus. There are many who will
oppose the reduction because they are in favor
of paying the bonus.

Senator Curtis of Kansas, prominent on the
Republican side of the Finance Committee,
has already introduced the Soldiers' Bonus
Bill into the Senate. This is practically the
same bill that was passed by Congress last
year and vetoed by the President. The allow-
ance is one dollar a day for home service and
one dollar and a quarter a day for overseas
service, the allowance for home service not to
exceed \$500 and overseas not to exceed \$625.

Immigration Question Up

Secretary of Labor Davis in his annual re-
port asked Congress, among other things, to
give the Labor Department greater authority
and facilities to better working conditions
generally; to make appropriations for improve-
ment of the immigration stations at New York,
Boston, Seattle and San Francisco; and to
enact a complete new alien code, providing for
selection of immigrants abroad, for the exclu-
sion of all non-naturalizable aliens, for the
penalizing of unlawful entrance of immigrants,
and for the enlarging of the work of naturaliza-
tion and Americanization. He also renews his
recommendation for constitutional amend-
ment empowering Congress to pass child
labor legislation.

tant doings in Washington with particular
reference to news that affects farmers' interests.

NEW YORK HOLSTEIN MEET- ING AND SALE JANUARY 8-10

THE annual meeting of the New York State
Holstein Friesian Association will be held
Tuesday, January 8, at the Yates Hotel,
Syracuse, N. Y.

The Fourth Annual Sale of the New York
State Holstein Friesian Association will be
held on the two days following the meeting,
January 9 and 10. Approximately 127 head
of black and whites will be put under the
hammer at that time.

HORTICULTURAL SOCIETY CHANGES MEETING DATES

THE eastern meeting of the New York State
Horticultural Society will be held in
Poughkeepsie on February 27, 28 and 29, 1924.
The annual meeting at Rochester will be
held as previously announced in AMERICAN

A CHRISTMAS "DOLLAR MAKER"

THE little girl of the family
wanted Santa to bring her a
"doll house" but I did not have the
doll or more to buy, so I made the
house and also a barn for the small
boy from National Biscuit Company
boxes. Any grocer has them to give
away. The house was painted white
and the barn red and both roofed
with remnants of roofing we had on
hand which was painted green.

I papered the rooms in the house
and stained the floors and some of
the cardboard furniture I made, with
a small can of oak varnish stain.
Tiny pieces of lace for curtains and
squares of green for shades, remnants
for rugs, made it look much like a
real home. The cook stove and a box
of furniture cost twenty cents. I
fixed tiny stalls in the barn and
bought a large family of animals for
forty cents. Every article I bought
came from the five and ten cent
store and totaled seventy cents.

The finished articles were even
better than those you can buy, and
the cost was very much less. I felt
that my time had been well spent
when I saw the delight of the two
kiddies on Christmas morning.—
Mrs. E. R. A., New York.

at around \$15 to \$16 net to the farmer. Some
are sanguine that the price will be better and
are holding their hay back. The likelihood is
for a higher price. Potatoes are mostly sold
out, the prevailing price being around \$1. The
farm bureau reports more than 700 members
for 1923-4, with about the same number for
the home bureau. Open weather has made
it possible for farmers to do a good deal more
plowing this fall than usual. Some are still at
this work. In spite of the rains we have had,
some wells are still dry. The fall has not been
heavy at any time. Cows are still picking
around on pasture at this writing, December
11th. About as much hay and grain are
needed, however, as if the snow were a foot deep.
Henry H. Dayton, one of the oldest farmers of
this part of the country, aged ninety-four,
died Thanksgiving Day at his home in the
town of Maine.—E. L. V.

Steuben County.—We are having excellent
weather for this time of the year, early Decem-
ber. Threshing is over with. To summarize
the work and results of the season: hay was a
light crop. Grain, except buckwheat, turned
out nearly normal in yield. Corn was a poor
crop. The potato crop was normal but with
labor where it has been for the past few years,
the profit potatoes produced is small. Potatoes
are now bringing 55 cents per bushel, butter
55 cents per lb., live chickens 15 cents per lb.
hay \$12 a ton loose, new milch cows \$75 to
\$100.

NEW JERSEY COUNTY NOTES

Mercer County.—Eugene P. Drake, a Mercer
County calf club boy, has been awarded the
AMERICAN AGRICULTURIST \$200 scholarship
for New Jersey. Mercer County folks are
pleased and are offering Eugene congratula-
tions, who has worked faithfully for his calf
club. Corn husking is over. The crop turned
out well. The Mercer County Board of
Agriculture fall meeting and dinner was held
on December 11 at the William Fleming
School. There were good speakers and music.
—Mrs. J. E. H.

PENNSYLVANIA FARM NEWS

In spite of the dry weather which prevailed
last spring, eastern Pennsylvania potato
growers harvested an unusually fine crop.
One grower in Luzerne County states that
one of his fields yielded over 500 bushels per
acre. Some potatoes are being shipped from
Berks and Lehigh counties. However, those
farmers who have ample storage facilities are
holding their crop in anticipation of higher
prices.

Prevailing prices of farm land are inducing
prospective buyers from distant points, accord-
ing to latest reports. Several transfers of
property have already been made. The near-
ness of eastern Pennsylvania farms to city and
the anthracite coal field markets is the induc-
ement. However, in many cases sales were
made at prices considerably below the original
cost of the buildings and fences—the land
being virtually a gift.

The wild rhododendron plants, which have
been so common in the Pocono Mountains,
have been practically wiped out. Commercial
interests have been digging these plants for
suburban landscape work. There is a large
demand for the hardy ferns that are also
common to this part of the mountains.

Cumberland County.—Up to the middle of
December we have had most unusual weather.
It has been extremely mild, much more so
than this time last year. We have had con-
siderable rain. There is more corn to husk
than for several years past. The corn crop is
turning out good, the fodder is very heavy to
handle. At some public sales corn has gone
to a price ranging from 8 to 13 cents a sheaf.
The high price is due to the scarcity of hay.
Both timothy and alfalfa are high in price.
Much is being packed and stored for higher
prices and it looks as though they will get it.
We had no snow thus far, although on several
occasions we had several frosts. The ground
was frozen slightly once but not very deep.—
J. B. K.

Crawford County.—November weather was
excellent. The first week in December finds
some corn to be husked. Plowing is finished.
Cows are being tested for T. B. Quite a
number in some herds have yielded to the test.
Eggs are 70 cents a doz., butter 50 cents to
60 cents a lb., live hogs 7 cents a lb., potatoes
\$1 a bushel, apples \$1.25 to \$1.50, horses are
selling at very low prices. No cattle moving
until the test is completed. Water is low.
Many springs and wells are still dry.

AGRICULTURIST, on January 15, 16, 17 and 18.
According to R. P. McPherson, Secretary of
the society, on January 16 the members of the
society will be asked to vote on the following
changes of the articles of the constitution to
read:

Officers of the society shall consist of
president, four vice-presidents, and a secretary-
treasurer, all of whom shall be elected an-
nually by ballot; also an executive committee
of six members shall be elected, two for each
of 1, 2 and 3 years respectively, and therefore
they shall be annually elected, two members to
serve for a term of three years.

NEW YORK COUNTY NOTES

Oneida County.—Farmers are busy getting
fire wood. Some are even plowing. The mild
weather has been extremely favorable for
farm work. We had plenty of rain within the
past few weeks. It has been much needed.
The Potato market is quiet! Prices are now
\$1 a bushel. The market for milch cows has
also been quiet this fall and early winter.
Many herds of cattle have been tested for T. B.
and many head have been condemned. J.
Kaslen Cheese Company is paying \$2.75 for
November and December milk. Pork 12 cents,
young pigs \$2.50 each, fresh eggs 90 cents a
dozen, hay \$10 to 12 in the barn.—E. N. A.

Along the Southern Tier

Broome County.—Some sections of the
County of Broome have determined to keep
their roads open on their own charges this
coming winter—a commendable undertaking
and one other localities might well enter upon.
A good deal of hay has moved out of this part
of the country in the past two months, mostly

How To Trap Skunks

A "Dollar Maker" With an Additional Scent

THE skunk is the easiest American fur bearer to

By ISAAC MOTES

trap. It is much more widely distributed than the muskrat, and its fur is more valuable. Skunk pelts which thirty years ago were worth only 15 cents are now worth from \$2 to \$4.

The skunk is really a peaceable animal, and minds its own business. No other fur bearer is so democratic, so unafraid as the skunk. He is so fearless of human beings and human habitations that we find him living not only under deserted houses and isolated barns, but under inhabited ones. It seems to have little fear of human beings, and not much fear of dogs, for its peculiar defensive armor renders it to a large degree immune from attack by human beings. The skunk has been known to enter country or village churches filled with people during Sunday evening services, to the consternation of the female portion of the congregation. The skunk stirs out earlier in the evening than does the raccoon.

The fur of the skunk and opossum becomes prime before that of the muskrat or beaver. This is because the water, and especially still water, cools more slowly in the autumn than the air, and water animals do not grow thick coats of fur until midwinter.

Black Pelts Best

Skunk pelts with the least white upon them are graded highest. "AA" is the best grade, almost solid black—only a small white spot upon the nape of the neck. "A" grade is known as the short stripe, the stripes being not more than three inches in length, upon the neck and shoulders. "B" grade is known as the long stripe—two stripes joined at the nape of the neck, and extending downward over or alongside the shoulders and back about half the length of the pelt. However, most skunk pelts are now dyed, so the natural color is not as important as the quality of the fur—its thickness and uniformity—and the size of the pelt.

The No. 1 steel trap will hold a skunk, but the common steel trap is not to be depended upon for catching skunks, for a skunk when trapped soon proceeds to gnaw off the imprisoned member on the under side of the jaws and close up to them. The little skin and flesh remaining is pulled away, and only a few hairs and a trifle of blood remain to tell the story. In recent years the double jaw or the triple clutch trap has been used in skunk trapping, and it is a decided success. Gnawing between the two sets of jaws is impossible, and although the toes may be chewed off a sufficient hold remains to render escape a remote possibility. I would advise skunk trappers to provide themselves with a supply of double jaw traps.

Bury new traps for a few days in the dirt or leaf mold, to take the brightness and the metallic smell out of them. This is better than smoking them. Traps coated with a combination of their sperm oil and tallow are proof against rust and the ravages of the elements.

Where To Set

The majority of the skunk tribe inhabit the abandoned burrows of woodchucks, badgers, gophers and foxes. The bulk of the traps should therefore be set at these old dens where skunk signs appear. Holes much used by skunk will be open and clear of rubbish, with trails or beaten paths leading to them, and often skunk hairs will be found on the side of the holes. Skunks also inhabit great stone heaps, rocky caverns, haystacks, undermined places caused by washouts, and many other places which offer a retreat and a dry nest. In looking for skunk dens don't fail to inspect empty old houses. Often they harbor a whole family of the striped gentry.

Set traps in the mouths of their burrows, abandoned holes, under old barns, around haystacks, and in their trails. Almost any kind of meat will do for bait, such as muskrat, rabbit, squirrel, chicken, green beef bones, etc. Perhaps the best is tainted meat, as they can smell it a longer distance. Place the bait on a sharpened stick stuck into the ground, some 18 inches high, or swing it to a low limb, with one or two traps set under it.

Skunks are in no sense wary of man's scent, nor clever in avoiding traps. And yet traps should be set with care. Dig out a little depression in the skunk trails for the traps, so they will not be cocked up and conspicuous, or liable to be kicked over or knocked aside. Set the trap in the center of entrance to their burrows, and place a little dry grass

or leaves under it, so it will not freeze down. Cover trap lightly with the same. If the entrance is large, so the skunk may walk to one side of the trap, block up a part of it with sticks or stones, or stake with a few brush to narrow the doorway. A piece of bait placed a little below the trap is a great inducement to them to enter if not inhabiting a hole, but merely visiting it.

In setting traps, success is better when they are placed at or near the entrance of a den than if set far within. If set inside, many a trap will be crawled over and sprung by the stumbling of the clumsy game, and nothing will be caught.

Skunks are Cannibals

Most skunks are cannibals. A skunk carcass hung up in any old place with a trap under it is certain to make a catch in a night or two—in fact almost every mild night, in good skunk territory. But any other kind of strong smelling meat will do. Skunks are sometimes so hungry that they will attack and mangle other skunks which are held fast in traps.

One of the best sets for skunk I ever used was, after catching one, to break the scent bag and cover the carcass with a light cover of leaves, dirt or snow, if there is any, and the weather is not too cold for them to be out. Do not put it very near their den, but rather along the runways. Conceal a trap in each route from which a skunk is apt to come. I have caught about as many by this set as any other. It is also a good set for civet-cat.

The question of killing skunks in the most humane way, and to avoid scent being thrown, is important. If the trapper is very busy he usually shoots his skunks through the head or back with a .22 caliber target rifle. To avoid getting scented up, your trap should be attached to a long, slender pole drag—a drag just heavy enough so the skunk cannot readily move it. Approach the trapped animal very carefully, get hold of the large end of the pole and very gently and slowly lead the trapped animal to a nearby creek or pond, lift him up easily and slowly and set him in deep water. Let him paddle until about tired out. Don't hold him under water longer than he has time to get a swallow of it. Let him up to gasp for air. Under he goes again; then give him a chance to get his head above water as before. Do this alternately until he gets groggy, full of water, stupid and slow in movements before it will do to hold him under entirely. If you drown him in too great a hurry the scent is thrown, and it will scent him as badly as if he had been on land.

Use Care in Skinning

In skinning such skunks be very careful, for the scent sack is brim full, and a slight pressure will force it out. In skinning it is best to cut clear around the opening to the scent sack, leaving a little patch of skin around the vent.

If a badly scented skunk is dipped in water thoroughly and hung up in the open air two or three days before being skinned, much of the odor will evaporate. Gasoline swabbed on a freshly scented skunk is a good deodorizer. Before skinning scented skunks, grease your hands thoroughly with lard, and when washed well with soap and hot water most of the scent will go with the grease.

Don't attempt to drown a skunk caught by a hind foot. You can't move him or approach closely without scent being thrown. The grip of the trap upon a hind foot makes them exceedingly bad tempered. Kill such catches on the spot, preferably with a .22 caliber target rifle, using the short cartridge, rather than with a .22 revolver. The rifle enables you to get a steadier aim, and at a safer distance from the catch. They may be shot through the head, but if you are an expert rifle shot clip them on the back just deep enough to break the back bone, but not enough to injure the pelt. A skunk with a broken back cannot discharge scent.

A skunk skin should be dried fur side in. The tail should be split clear to the end. It needs no tacking if properly split. After the skins are thoroughly dry, use care in packing them. In the AMERICAN AGRICULTURIST of

December 8 there were definite specifications relative to packing skins. Many a good pelt has been needlessly injured by overlooking this factor in the business. If your pelts reach the fur buyers in poor condition, all your efforts, setting your traps and the care in skinning, have gone for fun.

20 Extra Quarts of Milk Count 'em From Every Sack of International Special Dairy Molasses Feed

as compared to using wheat feeds or ground grains. We guarantee this increase has been secured in hundreds of actual tests.

INTERNATIONAL SPECIAL DAIRY MOLASSES FEED contains protein, molasses and fat combined in proper proportions to provide the necessary nutrients and energy required for maximum milk production. Both protein and molasses produce milk. Special Dairy contains both.

This great feed is digestible and palatable and is skillfully processed and mixed, thus insuring a big extra gain in milk. Accept no substitute. Inferior brands offered by other mills cannot produce the same profitable results as Special Dairy.

Free!—A Wonderful Dairy Book!

We have just published a beautiful Dairy Book containing fourteen large colored pictures of World's Champion Cows of various breeds. These pictures were made from actual photographs. Every dairyman will want a copy of this book. Nothing like it was ever before published—it is a masterpiece.

Your dealer will tell you how you can obtain a copy free of cost. If not sold by your local dealer, write us giving number of cows owned by you. Also give us your local dealer's name and address and we will mail you one of these books free of cost.

Live Dealers and District Sales Agents Wanted

FOR WINTER ROADS

Woodworth Double-Grip Tire Chains

They hold on ice, snow and deep mud—where others fail utterly. The cross members are made from thick sheet steel formed so that the edges of the metal grip the road and a perfectly-rounded, smooth surface comes next to the tire.

Less than 1/2" thick, they cause no bumping, even on pavements.

The side chains have springs in them which automatically tighten the chains—and as they cause no wear on the tire, they can be run very tight, preventing rattling and striking mud-guards.

Fasteners on both ends of side chains double-lock them and prevent danger of loss. Double the mileage of ordinary chains.

PRICES OF DOUBLE-GRIP CHAINS

Packed one pair in a bag

For 30 x 3 1/2 in. tires	\$5.00 per pair
For all other 3 1/2 in. tires	6.00 per pair
For all 4 in. tires	7.00 per pair
For all 4 1/2 in. tires	8.00 per pair
For all 5 in. tires	9.00 per pair

Delivered Parcel Post prepaid on receipt of above prices.

Good Agents Wanted

Here is something with which you can earn big money this Winter; for every automobile owner needs them.

Order a set or send \$1.00 for agents' sample, or write for agents' proposition.

AMERICAN AGRICULTURIST

Reports on the Serious Coal Problem

(Continued from page 420)

sizes of anthracite coal on hand and it is not possible to get coal from them. They all have been saying that they have been notified frequently, during the past few weeks of "shipment" of ears of coal. These ears never arrive, so we are forced to the conclusion that the wholesale dealers, after shipment have opportunities to sell at a higher price and divert the cars in transit.

"This we do know, that we can not get coal, and very little is coming to this part of the country.

"It looks as if the coal companies and wholesale dealers were going to force some kind of a government control of the hard coal mines."—H. R. T., Suffolk County, N. Y.

No Coal in Sight

"At present there is not any coal in sight. We have been paying \$13.50. We can get green wood at \$4.00 to \$4.50 a cord.

"I think some have enough for the winter. Others have hardly any."—W. A. T., Otsego County, N. Y.

Situation Worst Ever

"The coal situation here is the worst ever. That is, our dealer says it is hardest to get. He tells me that he has the promise of all he wants after December 1st when navigation closes on the lakes; that he had the promise of a couple of ears the first of this month but they have not shown up yet.

"The price is the same as last year, about \$14.00 to \$14.50 delivered chestnut.

"There is very little wood for the reason that it is practically impossible to get any one to cut it. The price seems to be from \$10 to \$12 for 128 cubic feet; that is, a cord of 4-foot wood, mixed hard and soft, about half and half."—J. A. E., Schenectady County, N. Y.

No Wood For Sale

"Coal is \$13.50 a ton and we are unable to get what we need. Have not been able to get any chestnut coal in the last three months.

"The price last year was less. There is no demand for soft coal, and no wood for sale in this vicinity. Farmers have about enough for their own use."—B. I. A., Monroe County, N. Y.

Price Same as Last Year

"There seems to be plenty of hard coal here and has been for some time. The price is about the same as last year. If I remember correctly, we paid \$13 to \$14 a ton. Now we pay about the same. We are not asked to take soft coal. I am not posted as to wood."—J. A. K., Monroe Co., N. Y.

Coal Mixed with Slate

"Hard coal very scarce, just a little now and then, so people will be rushing to get a small supply at any price asked. I have had an order in for several months for stove size and to-day purchased of another dealer one ton of egg, but had to load and draw it myself. I paid \$14.74 per ton cash. No credit to any one for coal and a considerable amount of slate is mixed with the coal. All summer train load after train load passed through over the Lehigh Valley to Canada, they say, but no coal for Moravia. Twelve years ago I paid \$4.80 and every year a little more. Coke and pea are \$14 a ton. Some wood is offered but not much at \$5 per cord about 12 to 14 inches long. The fuel situation is certainly getting serious for me."—C. B., Cayuga County, N. Y.

Situation Better

"I can say that although the situation is better than at this time last year, coal is still being dealt out in small quantities. Stove coal is hardest to secure. As yet we have been unable to buy all which is necessary. Conditions are about the same in the neighborhood. We are paying \$13.75 per ton at the yard. We have not yet been urged to use soft coal. It is of fairly good quality. The coal prices are slightly higher than last year. There is no good hard wood for sale in this section."—V. E. W., Oneida County, N. Y.

Big Trees are Gone

"The people can get the coal they need, hard or pea, but the price is \$2 a ton higher than last year. Last year the price was \$14 and the present price is \$16 a ton. The quality is not so bad. Some dealers got two earloads of slate or shale coal but they refused to unload them. One dealer has a new variety which he sells at \$12 a short ton.

Sawed wood brought at the sale \$4 for a two-horse load, but wood is not so plentiful. Still you can get some. The heavy or big trees are almost all gone."—S. W. B., Bucks Co., Pennsylvania.

The Broad Highway—By Jeffery Farnol

CHAPTER XXIX

IN WHICH I FORSWEAR MYSELF AND AM ACCUSED OF POSSESSING THE "EVILEYE"

SMITHING is a sturdy, albeit a very black art; yet its black is a good, honest black, very easily washed off, which is more than can be said for many other trades, arts, and professions. Since old Tubal Cain first taught man how to work in brass and iron who ever heard of a sneaking, mean-spirited, cowardly blacksmith? Your true blacksmith is usually a strong man, a man slow of speech, bold of eye, kindly of thought, and, lastly—simple-hearted. Black George himself was no exception to his kind. I found him a man, strong, simple and lovable, and as such I honor him to this day.

The Ancient, on the contrary, seemed to have set me in his "black books"; he would no longer sit with me over a tankard outside "The Bull" of an evening. He seemed to shun my society, and, if I did meet him by chance, would treat me with frigid dignity. Thus, though I had once had the temerity to question him as to his altered treatment of me, the once had sufficed. He was sitting, I remember, on the bench before "The Bull," his hands crossed upon his stick and his chin resting upon his hands.

"Peter," he had answered, regarding me with a terrible eye, "Peter, I be disappointed in ye!" Hereupon rising, he had rapped loudly upon his snuff-box and hobbled stiffly away.

One day, however, as George and I were hard at work, I became aware of some one standing in the doorway behind me, but at first paid no heed for it was become the custom for folk to come to look at the man who lived all alone in the haunted cottage.

"Peter?" said a voice at last and, turning, I beheld the old man leaning upon his stick and regarding me beneath his lowered brows.

"Peter," said he, fixing me with his eye, "were it a Scotchman or were it not?"

"Why, to be sure it was," I answered, "a Scotch piper, as I told you, and—"

"Peter," said the Ancient, tapping his snuff-box, "it weren't no ghost, then—ay or no?"

"No," said I, "nothing but a—"

"Peter!" said the Ancient, nodding solemnly, "Peter, I 'ates ye!" and, turning sharp about, he tottered away upon his stick.

"SO—that's it!" said I, staring after the old man's retreating figure.

"Why, ye see," said George, somewhat diffidently, "ye see, Peter, Gaffer be so old!—and he've come to look on this 'ere ghost as belongin' to 'im. Loves to sit an' tell about it; and now you've been and gone and said as theer be'n't no ghost arter all, d'ye see?"

"Ah, yes, I see," I nodded. "But you don't still believe in it, do you, George?"

"Why, y' see, Peter, we do know as a man 'ung 'isself theer, 'cause Gaffer found un—likewise I've heerd it scream—but since you say contrarywise—why, 'ow should I know?"

"But why should I deny it, George; why should I tell you all of a Scotsman?"

"Why, y' see, Peter," said George, in his heavy way, "you be such a strange sort o' chap!"

"George," said I, "let us get back to work."

Yet, in a little while, I set aside the hammer, and turned to the door.

"Peter, wheer be goin'?"

"To try and make my peace with the Ancient," I answered, and forthwith crossed the road to "The Bull." But with my foot on the step I paused, arrested by the sound of voices and laughter within.

"If I were only a bit younger!" the Ancient was saying. Now, peeping in through the casement, a glance at his dejected attitude, and the blatant bearing of the others, explained to me the situation.

"Ah! but you ain't," retorted old Amos, "you 'm a old, old man an' gettin' mazed-like wi' years."

"Haw! haw!" laughed Job and the five or six others.

"Oh, you—Job! if my b'y Simon was 'ere 'e 'd piteh 'ee out into the road, so 'e would—same as Black Jarge done," quavered the Ancient.

"P'r'aps, Gaffer, p'r'aps!" returned Job, "but I sez again, I believe what Peter sez, an' I don't believe there never was no ghost at all."

"Ay, lad, but I tell 'ee theer was—I seed un!" cried the old man cagerly, "seed un wi' these two eyes, many 's the time. You, Joel Amos—you've 'eerd un a-moanin' an' a-groanin'—you believe as I seed un, don't 'ee now—come?"

"He! he!" chuckled Old Amos, "I don't know if I du, Gaffer—ye see you'm gettin' that old—"

"Haw! haw!" laughed Job and the others, while Old Amos chuckled shrilly again.

"But I tell 'ee I did se un, I—I see'd un plain as plain," quavered the Ancient, in sudden distress. "Old Nick it were, wi' 'orns, an a tail."

"Why, Peter told us 't were only a Scottish man wi' a bagpipe," returned Job.

"Oh! you chaps, you as I've seen grow up from babbies—aren't theer one o' ye to tak' the old man's word an' believe as I seen un?"

The cracked old voice sounded more broken than usual, and I saw a tear crawling slowly down the Ancient's furrowed cheek. Nobody answered, and there fell a silence broken only by the shuffle and scrape of heavy boots and the setting down of tankards.

"Why, ye see, Gaffer," said Job at last, "theer's been a lot o' talk o' this 'ere ghost, an' some as said as they 'eerd it, but nobody's never laid eyes on it but you, so—"

"THERE you are wrong," said I, stepping in. "I also have seen it."

"You?" exclaimed Job, while half-a-dozen pairs of eyes stared at me.

"Certainly I have."

"But you said as it were a Scotchman, wi' a bagpipe, I heerd ye—we all did."

"And believed it—like fools!"

"Peter!" cried the Ancient, rising up out of his chair, "Peter, do 'ee mean it?"

"To be sure I do."

"Do 'ee mean it were a ghost, Peter?"

"Why, of course it was," I nodded, "a ghost, or the devil himself, hoof, horns, tail, and all—to say nothing of the fire and brimstone."

"Peter," said the Ancient, straightening his bent old back proudly, "oh, Peter!—tell 'em I'm a man o' truth."

"They know that," said I; "without my telling them, Ancient."

"But," said Job, staring at me aghast, "do 'ee mean to say as you live in a place as is 'aunted by the—devil 'isself?"

"Oh, Lord bless 'ee!" cried the old man, laying his hand upon my arm, "Peter don't mind Old Nick no more 'n I do. 'Cause why? 'Cause 'e 'ave a clean 'cart, 'ave Peter. You don't mind Old Nick, do 'ee, lad?"

"Not in the least," said I, whereupon those nearest shrank farther from me, while Old Amos shuffled towards the door.

"I've heerd o' folk sellin' theirselves to the devil afore now!" said he.

"You be a danged fule, Joel Amos!" exclaimed the Ancient angrily.

"Fule or no—I never see a chap wi' such a turble dark-lookin' face afore, an' wi' such eyes—so black, an' sharp, an' piercin' as needles, they be—ah! goes through a man like two gimblets, they do!" Now, as he spoke, Old Amos stretched out one arm towards me with his first and second fingers crossed: which fingers he now opened wide apart, making what I believe is called "the horns."

"It's the 'Evil Eye,'" said he in a half whisper, and betook himself away.

One by one the others followed, and, as they passed me, each man averted his eyes and I saw that each had his fingers crossed.

So it came to pass that I was, thence forward, regarded askance, if not openly avoided, by the whole village, with the exception of Simon and the Ancient, as one in league with the devil, and possessed of the "Evil Eye."

CHAPTER XXX

IN WHICH DONALD BIDS ME FAREWELL

HALCYON days! happy, care-free days! To waken to the glory of a summer's morning, and shaking off dull sleep, to stride out into a world all green and gold. To plunge within the clear, cool waters of the brook whose magic seemed to fill one's blood with added life and lust of living. Anon, to sit and eat until even Donald would fall a-marvelling; and so, through shady coppice and sunny meadow, betimes to work.

And then, the labor done, the fire dead—Black George to his lonely cottage, and I to "The Bull"—there to sit between Simon and the Ancient, waited upon by the dexterous hands of sweet-eyed Prudence. What mighty rounds of juicy beef, what pies and puddings, prepared by those same slender, dexterous hands! And later, pipe in mouth, what grave discussions upon men and things—peace and war—and Simon's new litter of pigs! At last, the "Good nights" being said—homeward through the twilight lanes.

BUT let it not be thought my leisure hours were passed in idle dreaming and luxurious ease; on the contrary, I had, with much ado, rethatched the broken roof of my cottage as well as I might, mended the chimney, fitted glass to the casements and a new door upon its hinges. This last was somewhat clumsily contrived, I grant you, and of a vasty strength quite unnecessary, yet a very excellent door I considered it.

Having thus rendered my cottage weather-proof, I next turned my attention to furnishing it. To which end I, with infinite labor, constructed a bedstead, two elbow-chairs, and a table; all to the profound disgust of Donald, who could by no means abide the rasp of my saw, so that, reaching for his pipes, he would fill the air with eldrich shrieks and groans, or drown me in a torrent of martial melody.

It was about this time—that is to say, my second bedstead was nearing completion, and I was seriously considering the building of a press with cupboards to hold my crockery, also a shelf for my books—when, chancing to return home somewhat earlier than usual, I was surprised to see Donald sitting upon the bench I had set up beside the door, polishing the buckles of his square-toed shoes.

"Man, Peter," said he, "I maun juist be gangin'."

"Going!" I repeated; "going where?"

"Back tae Glenure—the year is a'most up, an' I wadna' hae ma brither Alan afore me wi' the lassie."

"Heaven knows I shall be sorry to lose you, Donald."

"Eh, Peter, man! if it wasna' for the lassie, I'd no hae the heart tae leave ye. Ye'll no be forgettin' the 'Wullie Wallace Lament'?"

"Never!" said I.

"Oh, man! it's in my mind ye'll no hear sie pipin' again. But I'll aye think o' ye when I play the 'Wullie Wallace' bit tune—I'll aye think o' ye, Peter, man."

AFTER this we stood awhile, staring past each other in to the deepening shadow.

"Peter," said he at last, "it's no a vera genteel present tae be makin' ye, I doot," and he held up the battered shoes. "They're worn, an' wi' a clout here an' there, ye'll notice, but the buckles are guid siller, an' I hae naething else to gi'e ye. Ay, man! but it's many a weary mile I've marched in these; tak' 'em, Peter, tae mind ye o' Donal' Stuart. An' now—gi'e us a grup o' ye hand. Gude keep ye, Peter, man!"

So saying, he thrust the brogues upon me, caught and squeezed my hand, and turning sharp about, strode away through the shadows.

And, presently, I sat me down upon the bench beside the door, with the war-worn shoes upon my knee. As I sat there, faint and fainter with distance, and unutterably sad, came the slow, sweet music of the "Wallace Lament." Softly the melody rose and fell, until it died away in one long-drawn, wailing note.

Now, as it ended, I rose, and uncovered my head, for I knew this was Donald's last farewell.

CHAPTER XXXI

THE ANCIENT DISCOURSES OF MARRIAGE

Strike! ding! ding!
The iron glows,
And loveth good blows
As fire doth bellows.
Strike! ding! ding!

BUT beyond the smithy door a solitary star twinkles low down in the night sky, like some great jewel; but we have no time for star-gazing, Black George and I, for to-night we are at work on the old church screen, which must be finished to-morrow.

And so the bellows roar, the hammers clang, and the sparks fly. In the corner, perched out of reach of stray sparks, sits the Ancient, snuff-box in hand.

I stand, feet well apart, and swing the great "sledge" to whose diapason George's hand-hammer beats a tinkling melody, coming in after each stroke with a ring and clash exact

and true, as is, and has been, the way of masters of the smithing craft from time immemorial.

"George," said I, during a momentary lull, "you don't sing."

"I think, Peter."

"What's your trouble, George?"

"No trouble, Peter," said he, above the roar of the bellows.

"Then sing, George."

"Ay, Jarge, sing," nodded the Ancient; "'t is a poor 'cart as never rejices, an' that's in the Scripters."

GEORGE did not answer, but, with a turn of his mighty wrist, drew the glowing iron from the fire. And once more the sparks fly, the air is full of the clink of hammers, and the deep-throated Song of the Anvil, in which even the Ancient joins, in a voice somewhat quavery, and generally a note or two behind, but with great gusto and good-will notwithstanding:

Strike! ding! ding!
Strike! ding! ding!

in the middle of which I was aware of one entering, and, turning round, espied Prudence with a great basket on her arm. Hereupon hammers were thrown aside, for in that basket was our supper.

Very fair and sweet Prudence looked, with her shining black hair curling into little tight rings about her ears, and with great, shy eyes, and red, red mouth. Surely a man might seek very far ere he found such another maid as this black-eyed village beauty.

"Good evening, Mr. Peter!" said she, dropping me a curtesy, but as for poor George, she did not even notice him, neither did he glance toward her.

"You come just when you are most needed, Prudence," said I, relieving her of the heavy basket, for here be two hungry men."

"Three!" broke in the Ancient; "so 'ungry as a lion, I be!"

"Three hungry men, Prudence, who have been hearkening for your step this half-hour and more."

Quoth Prudence shyly: "For the sake of my basket?"

"No," said I, shaking my head, "basket or no basket, you are equally welcome, Prudence—how say you, George?" But George only mumbled in his beard. The Ancient and I now set to work putting up an extemporized table, but George stood staring down moodily into the glowing embers.

Having put up the table, I crossed to where Prudence was busy unpacking her basket.

"Prudence," said I, "are you still at odds with George?" Prudence nodded.

"But," said I, "he is such a splendid fellow! Surely you can forgive him, Prudence."

"There be more nor that betwixt us, Mr. Peter," sighed Prue. "'T is his drinkin'; six months ago he promised me never to touch another drop—an' he broke his word wi' me."

"But surely good ale, in moderation, will harm no man."

"But Jarge bean't like other men, Mr. Peter!"

"No; he is much bigger, and stronger!" said I.

"Yes," nodded the girl, "so strong as a giant, an' so weak as a little child!"

"Indeed, Prudence," said I, leaning nearer to her in my earnestness, "I think you are unjust. So far as I know him, George is anything but weak-minded, or liable to be led."

Hearing the Ancient chuckle, I glanced up to find him nodding and winking to Black George, who stood watching us from beneath his brows, and, as his eyes met mine, I thought they gleamed strangely in the firelight.

"Come, Prue," said the Ancient, bustling forward, "table's ready—let's sit down an' eat—faintin' an' famishin' away, I be!"

And after a while, our hunger being appeased, I took out my pipe, as did the Ancient and George theirs likewise, and we filled them, slowly and carefully, while Prudence folded a long, paper spill wherewith to light them. Now, while she was lighting mine, Black George

(Continued on page 431)

THE STORY AS IT HAS PROGRESSED SO FAR

AFTER numerous adventures along the Broad Highway, Peter Vibart, a penniless young London gallant, comes to a quiet English village where he decides to stay. He wins employment through a contest of strength with the village blacksmith, "Black George," a man of quick temper but great skill. Peter makes his home in a tumbledown cottage where his friend "the Ancient" has found a dead man many years before and which is reputed to be haunted. Peter finds that another tenant, a Scotch bagpipe player, is the "ghost."

Between George and Prudence, the Ancient's granddaughter, a quarrel has arisen and Peter unwittingly adds to the blacksmith's shame by overhearing some of it.

Men Wanted to Sell AMERICAN AGRICULTURIST

YOU can earn \$40 to \$60 a week taking new and renewal subscriptions to **AMERICAN AGRICULTURIST**. Some of our Regular Salesmen make from \$75 to \$100 every week.

Experience is not necessary. If you believe the **AMERICAN AGRICULTURIST** is the best farm paper in your State and can tell folks what you believe, you will succeed.

Of course, men who put in all their time and travel for us make more money than the man who must be home nights. Either man, however, has a place in the organization if he makes good.

Farmers who can get away and young men who have worked on farms are desired. Men with experience in selling will be given positions of considerable responsibility as district managers as soon as they show us their ability.

Representing the **AMERICAN AGRICULTURIST** is a pleasant and really worthwhile job. The pay is good, you make in accordance with your ability to earn.

If you would like to represent the **AMERICAN AGRICULTURIST** write me. Tell me what you are doing now, your farm and selling experience, whether you can put in all your time or only part time, and whether you have a car or horse and rig.

Join Your Home Bureau for 1924!

Mrs. Grace A. Powell Interprets Its Meaning to the Busy Farm Woman

WHAT is the real meaning of the words "Home Bureau"?

To the onlooker, perhaps, simply instruction in household management, the making of clothing, help in learning to care for the children and for oneself, still another meeting to attend.

But scattered over thirty-five counties of New York State there are more than 33,000 women to whom "Home Bureau" means more than this, and New Jersey, too, has an army of women enlisted under its banner.

Business changes brought to a suburb of New York City a woman of fine background and real brilliancy, the mother of four children. After the new routine became established, she looked about her. Her neighbors were women whose interest were the theater and the card-table. The newcomer was a New Englander, born to culture and the love of books, and her life for a time was given to caring for the children and bravely forgetting self.

With the advent of the county Home Bureau came a change. Little by little, things worth while were given to the one women's club the town boasted. Leaders developed from among the ranks of "Bridge" devotees.

The town is not yet a model but it is changed. Best of all, a lonely woman has found work to do, real work for community betterment, and feels herself no longer "a square peg in a round hole."

A Girl Who Dreamed

A young girl grew up in a little country town and attended the school, an old-time academy, where she learned a little mathematics, a little science, a little Latin, just enough to make her long for more. Not far away was a great university, the ultimate goal of all her girlish dreams. When at sixteen she graduated, they told her—no, she told them on the commencement platform—that all opportunity lay before her, just within reach. But when she came to look her future in the face she found on one hand the longing for college, on the other a widowed mother and no money. So with a heart that ached and with tears of which the mother never knew, she turned away from all her dreams and went to work.

In those days, there was only teaching for a girl, and she taught for years. She loved her work, and when the mother left her and she was free to live her own life, the time for college seemed past.

After a while she married and when her little children came, the mother's happiest thought, as she looked at their little faces, was an echo from days gone by—"They can go to college!"

Some Dreams, at Least, Come True

Then came the war and all its stress and endless activities for the women of the land. Then came the Home Bureau. The other phases of University Extension work had somehow passed her by, but the Home Bureau grew to be an enthusiasm. As the work and the workers grew in vision and in numbers, it seemed that a great university had reached out and with tender fingers touched a waiting woman. When after a while the conferences at the college came, one woman saw with misty eyes the spires and towers of Cornell. She had come at last to college and as time went on, there came to her the friends, the pleasure, much of the learning which she had given up in youth.

So, to lonely women, to women who in their girlhood days have "dreamed dreams and seen visions," to mothers of little children who need the wider vision of life, to all who long to serve the words "Home Bureau" mean also "Opportunity."—GRACE A. POWELL.

FOR VERY LITTLE CHILDREN

CITY and country alike are faced with the problem of the child of school age who does not wish to continue his or her education long enough to get from it any real benefit in after life. This, perhaps, is partly the fault of the schools which do not often make a special effort to hold the growing boy or girl, and in many cases it is also the fault of the parents who do not take the trouble to show their children just what education will mean to them in after life.

No one wants children sent to school too early and forced beyond the mental capacity of their years, but we are just beginning to realize that even the very young children are constantly learning by observation and that if we do not guide them, they may learn habits of carelessness and selfishness. It is for this reason that kindergartens have come into being. They mold character by giving the children amusing and helpful occupation.

During the past year several of our states

have taken forward steps in making kindergarten training possible for the small children. Illinois and Mexico have just passed progressive laws providing that interested citizens may obtain kindergartens by petition. The women of California were recently influential in having enacted a similar law which put that state first in its provision for kindergartens for young children. Anyone who is interested in obtaining one in the neighborhood, or who, because of distance or the small number of children, wishes to give individual instruction in the home, may obtain further information upon request from the National Kindergarten Association, 8 West 40th Street, New York, N. Y.

AN UNUSUAL GUEST DAY

If the Guest Day Committee of your club is searching for an unusual plan try this one: A club in our neighborhood sent out invitations for a reception and picture display. The entire art display from the extension de-

hung upon the walls of two large rooms at the home of one of the Club members. They were hung in groups according to the age and school of the artists, from the early Italian Masters down to the present day. Club members who were familiar with the pictures, gave interesting information about each picture and its painter, as they pointed them out to the guests. Music during the afternoon added to the entertainment.

When the guests had completed the round of the picture gallery as they called it, they were invited into the dining-room which was gay in club colors carried out in the candles, shades and flowers. Light refreshments were served. A small print of one of the large pictures, rolled and tied in club colors was laid at each plate for a favor.

To residents of small towns, or the country where there are no public libraries, art galleries or museums, this afternoon was a real treat. It brought to their very doors something they could never see any place except in our large cities, with the added advantage of the explanation of each picture. One guest said to me as she left:

"I never fail to visit the Metropolitan Museum when in New York and have seen time and time again, the originals of many of these prints, but they never meant to me what they do now. Your added explanation has given me so much that when I next see the pictures, they'll be old friends instead of passing acquaintances."—LUCILLE WARD.

A DISTINCTIVE TOUCH FOR STAIRWAYS

WHEN building or re-modeling a home of two-stories let the housewife see to it that all newel-posts of the stairs are made flat-topped. This serves two purposes:

Small articles to be carried upstairs or down may be placed upon these—especially at a back stair—awaiting a trip, thus saving many unnecessary steps.

Besides, the flat tops afford decorative possibilities. A low vase of ferns or a drooping plant at the foot or at the turn of a front stairway is most effective. Many ferns, like the sprengeri, need but little sun, and the long fronds over the side of a banister give a beautiful touch of green at an unlooked for spot.—LEE McCRAE.

What One Subscriber Thinks

I want to tell you how very much I admire your patterns. They're quite the neatest and most practical I've ever seen—and the kind of dresses that anyone can wear.

I am very fond of your book. It's so friendly and gives one the impression that one is having a personal chat with one's friends. I sincerely wish you all the luck in the world!—Mrs. A. L. H.

THE LITTLE GIRL, THE MEDIUM ONE AND BIG SISTER

LONG-WAISTED, with a Peter Pan collar and short or long sleeves, is No. 1927, a comfortable, pretty school frock. Of serge, wool jersey or challis it would give excellent wear. No. 1927 comes in sizes 6, 8, 10, 12 and 14 years. It takes, for the 8 year size 1½ yards 40-inch material with ½ yard contrasting. Price 12c.

THE college girl or the busy home-maker will like this two-material dress. No. 1933 is cleverly adapted to almost any figure and the use of two materials is usually an economy. No. 1933 comes in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. For size 36, use 2 yards 36 or 40-inch material with 1½ yards contrasting. Price 12c.

A STYLE that is simple but very becoming to the growing girl is No. 1840, which has the additional advantage of being easy to "jump into" on frosty winter mornings. No. 1840 comes in sizes 8, 10, 12 and 14 years. Size 8 takes 2¾ yards 36-inch material and 2¼ yards binding. Price 12c.

TO ORDER: Write name, address, numbers, sizes, clearly. Enclose correct amount and send to Pattern Department, **AMERICAN AGRICULTURIST**, 461 Fourth Avenue, New York City. Add 10c if you wish our Winter Fashion Book, with both dress patterns and embroidery designs.

A Special Page for the Farm Cook

Standard Measures and Some Holiday and Everyday Recipes

POST THIS IN YOUR KITCHEN

WE are getting to be better cooks.

Although there are housewives whose skill in the kitchen can not be matched by any foreign chef, on the whole there has been considerable truth in the charge that many American women gave their families monotonous, badly planned meals. And that did not mean they skimped on work—on the contrary, they spent exhausting hours over the hot stove.

Someone has said that there has been more progress in the knowledge of nutrition in the last ten years than in the entire century before. And one of the most important forward steps is the adoption of standard measurements and their accurate use by home cooks. We no longer admire the woman who trusts a "sixth sense" to add "a pinch" here, a "handful" there and something else "to taste." She has given way to the housewife who uses a table of exact measures and who mixes her cake with no guesswork but sure, scientific accuracy.

So in undertaking any cooking, the first principle is—Yes, perfect cleanliness of course, but after that accuracy in measuring ingredients. For the use of the farm housewife who wants a simple table which she can apply to small bakings or large, the picnic supper, or the big family gathering, we suggest the following measures and weights as thoroughly dependable in translating general "old-fashioned" terms into concrete, modern ones:

- 1 heaping teaspoon—3 level teaspoons.
- 1 rounding teaspoon—2 level teaspoons.
- 3 level teaspoons—1 tablespoon.
- 16 tablespoons—1 cup or 1 gill.
- 1 cup— $\frac{1}{2}$ pint.
- 1 pint liquid—1 pound.
- 2 tablespoons fat—1 ounce.
- 1 cup butter— $\frac{1}{2}$ pound.
- Butter size of a walnut—1 tablespoon or $\frac{1}{2}$ ounce.
- Butter size of an egg—2 tablespoons or 1 ounce.
- 4 cups flour—1 quart or 1 pound.
- 3 cups cornmeal—1 pound.
- 2 cups granulated sugar—1 pound.
- 1 pint finely chopped meat—1 pound.
- 3 level teaspoons ground spice— $\frac{1}{4}$ ounce.
- 1 tablespoon mustard— $\frac{1}{4}$ ounce.
- 1 pound almonds— $3\frac{1}{2}$ cups.
- 1 pound dried apricots—3 cups.
- 1 pound navy beans (dried)— $2\frac{1}{4}$ cups.
- 1 bunch celery (diced)—1 cup.
- 3 ounces cheese (American)—1 cup grated.
- 1 ounce chocolate—1 square or 4 tablespoons.
- 4 ounces cocoa—1 cup, or 1 tablespoon— $\frac{1}{4}$ ounce.
- 1 pound cornstarch—3 cups.
- $\frac{1}{2}$ pound cream (light)—1 cup.
- 1 pound milk—1 cup.
- 1 pound graham flour—4 cups.
- 1 pound hominy—4 cups.
- 4 pounds macaroni (dry)—4 cups.

A VARIETY OF CHEESE DISHES

CHEESE dishes make a good substitute for meat, as cheese contains a great deal of nourishment. If one lives in the country it is sometimes hard to have fresh meat every day. Cheese can be kept several days and there are a great many ways in which it can be prepared.

Cheese Pudding

Take one cup finely chopped cheese, one cup bread crumbs, one cup milk, one egg, one tablespoon of butter, one-half teaspoon of salt and dry mustard and a dash of cayenne. Arrange the cheese and bread crumbs in a baking dish in alternate layers. Beat the egg and add to the milk with the seasoning and pour over the top; add some little pats of butter and let the dish stand for fifteen minutes to soften the bread. Bake in a good oven until the top is firm like custard, about fifteen minutes. Serve hot.

Cheese Scrambled

Melt one-half pound of cheese in a frying pan. When soft add one cup of thick sweet cream, a pinch of salt and a dash of pepper. Mix thoroughly, then break into the mixture six eggs and cover for a few minutes until the whites begin to set. Remove the cover and stir vigorously until the yolks of the eggs are cooked without being hard. Pour out at once on buttered strips of toast or on crackers which have been heated and buttered.

Poached Eggs with Cheese

Melt two tablespoons of butter, add two tablespoons of flour, stir until smooth; add one cup of milk and stir over the fire until thick. Add one-half teaspoon of salt, dash of pepper

and one-fourth cupful of grated cheese. Stir until cheese is melted. Poach four eggs in salted water, arranged each on buttered toast, pour over them the cream sauce and serve.

Cheese Desert

Mix together three-fourths of a cup of rich milk and one and one-fourth cups grated cheese and heat carefully, stirring all the while until cheese is melted. Remove from fire, add a pinch of salt and when slightly cool, the yolks of three eggs. Have ready a small pie dish lined with a very thin biscuit dough, fill with the egg and cheese mixture, grate a very little nutmeg over the top and bake in a moderate oven until set. Serve cold with jelly or preserves.

Rice Croquettes, Cheese Sauce

Soak one-half cup of rice overnight in cold water to cover, drain, add one-half cup of boiling water and cook in double boiler until rice has absorbed water. Then add one and one-half cups of milk and cook until rice has absorbed milk. Add one-fourth cup of cream, two tablespoons of chopped canned pimientos, one-half teaspoon of salt. Spread on a plate to cool. Shape, dip in crumbs, egg and crumbs. Fry in deep fat. Pile on a serving dish and pour around cheese sauce. Melt three tablespoons of butter, add three tablespoons of flour, stir until well blended, then pour on gradually while stirring constantly one and one-half cups of milk. Bring to the boiling point. Add one half teaspoon of salt and one cup of mild cheese grated or cut in small cubes.

Cheese Puffs

Put two tablespoons of butter in a saucepan, pour over it a cup of boiling water. In a bowl mix one-half cup of grated cheese, one-half cup of flour, a little salt. When blended add to the hot water, stir until smooth and boil very slowly for five minutes.

When nearly cool add two unbeaten eggs, one at a time and beat steadily for fifteen minutes. Drop with a small spoon on buttered pans, and bake slowly for twenty minutes.—Mrs. R. C. DE LYNE.

MAKE YOUR OWN COOK BOOK

A FEW years ago I made a home cook book which has been the admiration of many of my friends. Thinking that it might help others as well as myself, I am sending a description of it.

I purchased at a book store a blank book twelve by seven inches. On the outside I glued colored illustrations of oranges to brighten the dark cover.

Next I divided the book into different parts, each part devoted to its own particular use, such as cakes, cookies, pies, breads, meats, pickles, salads, deserts, canning of vegetables, meats and fruit and one for miscellaneous recipes. Each part was indexed in the back of the book.

The section devoted to cakes will serve as an illustration of how I arranged the rest. From an advertisement of cake flour, I cut colored pictures of chocolate, yellow, marble, Lady Baltimore, sponge, nut and white cakes. Under each of these pictures were recipes from my grandmother, mother and friends, and all others that were found good. The colored illustrations show how the finished product should look, assist in suggesting variety and are a real aid to a beginner.

I collected cook books sent out by various firms for advertising their goods and sent to the Government for books on canning and other food subjects. The recipes and suggestions I wished to keep I cut out and put in my cook book.

It is hardly possible to realize what an incentive a few colored pictures are when cooking; yet somehow they stir me to do my best, and I will never be quite content until I can equal those before me. I know my book has made me a better cook.—EDNA AUGSBURG.

UNUSUAL HOLIDAY CANDY

Glaze Walnuts.—2 cups confectioner's sugar, 1 cup water, 1 tablespoon vinegar. Boil till mixture hardens in cold water. Move to back of stove and drop in walnuts piece by piece. As soon as nuts are well covered, pour on buttered plates to cool.

Marshmallow Fudge.—2 cups sugar, $\frac{1}{2}$ cup cream, 1 square chocolate, 1 tablespoon butter. Boil ten minutes. Add $\frac{1}{2}$ lb. marshmallows and stir till partly dissolved. Spread another $\frac{1}{2}$ lb. marshmallows on buttered pans, pour the hot fudge over them and when partly cool cut into squares.

Chocolate Chips.—Make a plain pulled

molasses taffy, pull it as thin as possible, and cut into inch or two inch strips. Have ready some melted chocolate. Dip the chips carefully into the chocolate and when well coated dry on waxed paper or buttered plates.

Maple Creams.—Boil 2 cups maple sugar and 1 cup water, without stirring, till it reaches the soft ball stage. Add 1 teaspoon butter and stir till the mass is thick and waxy. Form into balls and enclose each ball between 2 walnut halves.

Peanut Blocks.—2 cups molasses, 1 cup brown sugar, 1 tablespoon each butter and vinegar. Cook till it threads readily and pour into buttered tins, spread generously with peanuts. When nearly cool cut into blocks with a thin sharp knife.

French Bonbons.—Make a foundation fondant using whites of 2 eggs and an equal quantity of water, mixing stiff with confectioner's sugar. Take out a part of this, flavor with almond extract, form into balls and press a large whole nutmeat firmly into the top of each bonbon.

Neapolitan Bonbons.—Take three equal quantities of fondant. Color one part pink with fruit coloring, flavor with rose, and roll flat and quite thin. To the second part add enough melted chocolate to color it well, flavor with vanilla, roll exactly like the first piece and lay it on top. Leave the third part white, flavor with lemon, roll like the others, lay it on them, and roll the pile lightly to make them adhere firmly. Cut into any shape desired, being careful always to cut entirely through the stack so that all three colors will show.

Fruit Surprises.—Have ready some large seeded raisins and a quantity of chopped figs and dates. These should be cut very coarsely, however, so that the pieces will be large. Enclose each piece in a roll of fondant and dip a few into melted chocolate for added variety.

Superior Wintergreen.—To a portion of plain fondant add pink fruit coloring to make a pretty pink, flavor with wintergreen, form into balls and dry on waxed paper.

After Dinner Mints.—Leave a quantity of fondant white, flavor with peppermint, form into small balls, and flatten lightly by pressing with some small article with a pattern on the bottom like an individual glass salt dish. If peppermint oil is used be careful not to put in too much.—Mrs. E. M. ANDERSON.

DO YOU KNOW THAT —

Fruit stains can be removed from table linen by rubbing with camphor, before you wet them in water.

If brushing will not remove mud stains from garments, rub with a slice of raw potato.

Run berries for jams through the food chopper. They will cook more quickly and be smoother.—IDA A. BROWN.

Have the youngsters the bug-hunting craze? The state collect at Ithaca has a free bulletin telling about hunting and preserving insects. It is E59.

A glass of water apiece before breakfast for all members of the family will do a lot toward keeping their systems in good working order.

To preserve the decorations or gold borders on fine china, use a mild soap and wash one piece at a time.

Never use your angel food pan for anything else, not even to bake another kind of a cake. It will cause the angel food to stick and tear.

Patent leather and kid shoes can be kept soft and nice if they are rubbed once a week with glycerine, vaseline or castor oil.

When making lemon pies, slice one banana crosswise and add it to the filling. Then complete the pie as usual.

Grease spots on suede shoes will disappear if they are rubbed well with a cloth dipped in glycerine.

In making aprons, I put the pockets on the inside. That is, I put the patch pocket on the wrong side and make a diagonal hole through to the front. Then the pocket can not catch on nails, door knobs or any other projection.

The Broad Highway

(Continued from page 429)

suddenly rose, and, crossing to the forge, took thence a glowing coal with the tongs. All at once I saw Prue's hand was trembling, and the spill was dropped or ever my tobacco was well alight; then she turned swiftly away, and began replacing the plates and knives and forks in her basket.

(To be continued)

A Modern Bathroom, \$60
The "Pride"
Just one of our wonderful bargains. Set comprises a 4, 4 $\frac{1}{2}$ or 5 foot iron enameled roll rim bath tub, one 19 inch roll rim enameled flat-back lavatory, and a syphon action, wash-down water closet with porcelain tank and oak post hinge seat; all china index faucets, nickel-plated traps, and all nickel-plated heavy fittings. Reviewing the Latest Eastern Markets and Prices

APPLES MORE ACTIVE

HERSCHEL H. JONES

THERE was a slackening of receipts of boxed apples and a fairly good supply of barreled apples last week, more coming in from the South than from other sections. The demand was good for large and fancy fruit. Prices were about the same for the average A Grade 2½-inch stuff. Increased demand for apples is hardly to be expected with oranges and other fruit so cheap.

Toward the end of the week there was lighter receipts and a more favorable turn in the market. Buyers are quietly picking up desirable lots.

The latest available figures as to quantity of apples held in storage on December 1, 1923, stated in terms of barrels, are 14,639,216 bbls., compared with 11,440,893 bbls. on same date last year. This large increase in current holdings with a dull market and slow demand at a season which is ordinarily active, is not encouraging. This amount includes 6,375,249 actual barrels and 24,791,901 actual boxes in storage Dec. 1, 1923. The increase in barrels over last year is 1,268,663 and in boxes 5,788,980. In the past there has usually been an increase, one year in barrels and the next in boxes, but this year both are in excess. It is reported that approximately 50,000 barrels are held by farmers.

Following are quotations on A Grade minimum 2½-inch N. Y. State barreled apples at N. Y. December 13: per bbl., BALDWINs, mostly, \$4 to 4.50; few, fancy, \$5 to 5.50; ordinary, \$3.50 to 3.75. BEN DAVIS, \$2.50 to \$3. GREENINGs, best, \$5.75 to \$6; fancy, \$6.25; fair stock, \$5.25 to 5.50; ordinary, \$4 to 4.50. HUBBARDSTON, \$3.50 to 3.75.

POTATO DEMAND LIMITED

In New York City wholesale markets the demand for potatoes was very limited last week and the prices were low. On the other hand in the producing sections prices were a little firmer.

Long Island potatoes are sold at the loading point in carlots from \$3 to \$3.10 per 150 lb. sack. Some shippers were quoting \$3.20 bulk. South Side sold for \$1.15 bu. loaded.

"Maines" firmed up to \$2.80 per 150 lb. sack delivered New York City; bulk \$1.70 cwt. "States" sold in bulk from \$1.40 to \$1.50

per cwt., delivered in 150 lb. sacks from \$2.25 to \$2.35 per sack. "Michigans" and "Minnesotas" sold from \$1.75 to \$2 per 150 lb. sack on the docks.

CABBAGE MARKET FIRM

The demand for good medium Danish cabbage was fair and the price steady. Most shippers up-State were quoting bulk from \$20 to \$23 ton loading point. Some sacked cabbage sold as high as \$25 per ton in the country. In the city the wholesale price ranged from \$30 to \$35 per ton for fancy stock.

BROWN EGG PRICES EQUAL WHITE

The egg market took a severe slump last week and prices generally declined 5 to 7c per dozen. There is an over-abundance of white eggs on the market. Pacific Coast whites have been arriving in great abundance as well as nearby fancy white eggs. As a result brown eggs sold in some cases as high or at higher prices than white eggs of the same quality—an extraordinary thing in New York City where there is usually a high premium for white eggs. For a long time it has seemed impossible to fill the New York demand for fancy whites but the high prices have brought new producers into the business and induced better grading and packing, until it appears the demand, temporarily at least, is filled.

BUTTER MARKET EASIER

Following a strong market, butter eased up considerably the past week and prices declined slightly. Probably high retail prices have done much to check the consumptive demand. At any rate supplies exceed the demand and dealers showed little tendency to buy.

A large shipment of butter arrived from Auckland, New Zealand, during the week. This is a forerunner of other shipments due. The butter was of fine quality but a slightly different flavor from the domestic grades. It sold well at 47 to 51c per pound.

CHEESE MARKET QUIET

Cheese markets generally were quiet with little trading. State flats sold at from 25 to 26½c. According to latest reports there is on hand in the four principal warehouses 19,478,000 pounds compared with 11,942,000 pounds last year at the same time. In New York City holdings are 4,062,000 pounds as against only 1,525,000 pounds a year ago.

TURKEY PRICES RUINOUS

The Thanksgiving turkey market was disastrous to all but the earliest shippers. By the day before Thanksgiving the housekeeper could buy from her retail store cheaper than the wholesale price a week earlier.

Dealers are hoping that the usual will happen and that low Thanksgiving prices will mean high Christmas prices. But there are still large quantities in the country, many of which will not even reach the market for the holidays, and storage holdings are unusually heavy.

This year doesn't look good for the turkey-raisers.

HAY UNCHANGED

Hay trading showed little change with prices for No. 1 ranging from \$29 to \$30 on best lots. Hay continues to move out freely. State rye straw brought \$20 to \$21 per ton and oat straw \$14 to \$15.

LITTLE DEMAND FOR LIVE CALVES

There was but little demand for live calves in the past week and the market was quiet. Top prices would hardly reach \$13. On dressed veal the market was generally steady, choice grades realizing 20c to 21c with a few bringing 22c. Very few lambs arrived at the yards and prices were firm.

SELECT DEALERS AS WELL AS BETTER SEED

"USE the same care in selecting the commission man to sell your products that you did in selecting the seed to grow the crop."

Marketing officials of the State Departments of Agriculture make this recommendation, following investigations of complaints regarding questionable practices of certain concerns in Newark who solicited business from growers during the last season.

With the large field of reliable commission houses from which to select a firm to handle his products, there is no reason for any farmer to risk loss through contact with unreliable concerns. The commission men themselves are continually elevating the ethics of their trade, and are seeking the cooperation of merchants and growers in eliminating the tricky dealer.

TO GUARD AGAINST AUTO THIEVES AND TRESPASSERS

AN amendment to Section 1425 of the Penal Law has been suggested by Mr. H. M. Brigham, which will be introduced in the Legislature this year. It should, if passed, go a long way toward stopping the robbing of farmers by automobile thieves.

The suggested amendment reads as follows:

A person who wilfully enters upon the lands of another or of the people of the state and cuts down, girdles, destroys or in any way injures any shrub or vine being or standing upon such lands or destroys or in any way injures any building, fence, structure or improvement erected thereon or destroys, injures or carries away any domestic animal or fowl or any fruit, vegetable, grain or product of such lands is punishable as follows:

a. If the value of the property destroyed, taken or carried away, or the diminution in value of the property injured is more than two hundred and fifty dollars by imprisonment for not more than four years.

b. In any other case by a fine of not more than two hundred and fifty dollars or by im-

prisonment for not more than six months or by both such fine and imprisonment.

c. In addition to the punishment hereinbefore prescribed by a fine which shall be equal to treble the damages of the injury done and which shall in any event be for not less than twenty-five dollars. Such fine shall be payable to the owner of the property injured.

As the law now stands, the only way an owner could recover damages is by the long drawn out process of suing for same through the courts. As offenders are usually financially irresponsible, such action was generally of no avail. You will note section "c" of the proposed amendment provides for definite fines to be paid to the owner of the property. If this amendment is passed it will also be possible, should any person violate any of its provisions, to have his automobile license cancelled and no new license issued to such person for a period of thirty days and thereafter only at the discretion of the tax commission.

It seems to us that this amendment is fair and is a sensible way of stopping the automobile fruit and vegetable thieves. Undoubtedly, a hearing later in the winter will be given. If farmers show enough interest in this hearing to attend it in large numbers and to write letters to their legislators, the amendment can be passed. If you are enough interested to be willing to attend such a hearing when the time comes, write the AMERICAN AGRICULTURIST, 461 Fourth Avenue, New York City, and we will give you the time and place when we have that information.

FEEDING PULLETS FOR WINTER EGGS

HAVE all laying birds in winter quarters. Pullets roosting in trees during cold, weather often contract roup, the most dangerous winter disease of poultry.

Keep before the birds at all times a good laying mash, like one of these: Bran, 100 lbs., middlings, 100 lbs., ground oats, 100 lbs., corn meal, 100 lbs., meat scrap or tankage, 100 lbs.; or, corn meal, 135 lbs., ground oats, 135 lbs., ground wheat, 135 lbs., meat scrap 100 lbs.

If the birds are thin, feed more grain in the morning. If in good condition, feed less grain in the morning. Regardless of their condition, feed a heavy grain ration in the evening. Feed unlimited supplies of milk, if you seek a high egg production. With as much milk as they want, the birds will not need so much meat scrap or tankage in the mash.

Pullets require 12 pounds of scratch feed a day per hundred birds. This should be made of equal parts of cracked corn and wheat. If artificial lights are used, then 14 pounds of scratch feed should be fed each day. Mash should be available to the birds at all times. Feed either the standard New Jersey ration or a good commercial mixture. Do not allow the pullets to lay more than 50 per cent. of normal production for the next few months.

Putting Small Fruits to Bed

(Continued from page 425)

"cover" for raspberries, blackberries, dewberries and grapes in any stage of growth, and if tall weeds or some better cover-crop (especially the climbing winter vetch which may safely be seeded during the last June or early July cultivation) be not there in abundance, and also if the plants are only one or two years set—by all means drive right into your patch in December and strew through the rows at least 3,000 pounds per acre of some such protection.

Still Something to Be Learned

And we are learning yet. Last spring's weather, the forepart of April, tempted us to take away these protections too soon. As a result it cost us some hundreds of dollars for thus disregarding Nature's law. These thus exposed small fruits rushed on toward flowering too soon and too fast, and a medium-hard frost the 11th of May blighted the crop—even our grapes.

How are we so sure? Well, we didn't clean out all of those berry rows, and over behind the buildings there is another lot of grapes whose roots were still tucked that cold May night in bed as they had been through the winter. In both these cases the flower-buds were about five days behind the injured ones—and everyone escaped and have fruited well!

To be sure our method encourages mice, and they do gnaw a few blackberry canes some winters, but two very gentle cats, trained to ignore the birds, live almost the year around in those berry bushes, and—well we are more and more studying to follow Nature—merely intensifying her ways.

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on December 13, 1923:

Eggs, Nearbys (cents per dozen)

	New York	Buffalo	Phila.
New Jersey hennerly whites uncandled, extras.....	62

Poultrymen Hold Production Show

New Yorkers Boost Layers Instead of Fancy Feathers—Vineland Winners

"BOOST production poultry," was the big thought behind the second annual New York State Production Poultry and Egg Show held December 4, 5 and 6, at the College of Agriculture, Ithaca, N. Y.

This unique exhibit was set up in the animal husbandry judging pavilion, which provided enough space for the proper cooping of more than 1,000 birds and for the display of 87 dozen eggs, entered for competition by the poultrymen of the State. Educational exhibits, including stereopticon slides, charts, diagrams and skeletons of different types of

By I. W. INGALLS

nicker, Fort Plain, Montgomery Co., for best cock; G. M. Brill, Brookton, Tompkins Co., for best hen; and R. A. Heller, Owego, Tioga Co., cockerel and best pullet. The New York State Cooperative Poultry Certification Association awarded two cups, one to the White Spring Farm, Geneva, Ontario Co., for best pen, and one to G. M. Brill, Brookton, Tompkins Co., for most points won by a member. Two prizes of 25 Cornell pedigreed chicks each were awarded to Walter S. Lyon, of Ovid, Seneca

Charles Mearson led the Cayuga delegation with 13 points. H. H. Hawland and Mrs. E. Sohmer also exhibited from this county.

Those counties winning less than a total of 20 points and the exhibitors are as follows: Cortland County, 16 points, R. E. Newcomb and George Gilbert; Madison, 16, W. H. B. Kent; Oneida, 14, Potter & Pepperman; Albany, 9, G. D. Schultes; Erie, 8, Charles H. Williams, R. W. Baum and E. Hanewinkel; Ontario, 8, A. G. Lewis; Nassau, 7, T. F. Edwards; Rensselaer, 7, Mrs. Emily Henrotem. Wayne, 5, Peter Poray; Onondaga, 4, E. W. Berger; Orleans, 5, W. A. Crandall; Orange, H. L. Davies; and Monroe, L. T. Dunn.

THE VINELAND WINNERS

THE illustrations on this page show the winning hen and a part of the winning pen that took first honors among all breeds and entries in the International Egg Laying and Breeding contest at Vineland, New Jersey, which closed its current season on November 1st.

"Lady Bountiful" and the other winning fowls, which are all White Leghorns, are owned by James Whetsel, of Vineland, N. J., one of our leading farm bureau executives in the State, prominent co-operative leader and nationally known by his connections as a member of the National Egg Marketing Committee of the American Farm Bureau Federation.

Mr. Whetsel is president of the Atlantic Coast Poultry Producers, Inc., a co-operative egg marketing association representing 285,000 laying hens in New Jersey and adjacent States and the only large co-operative egg marketing organization in the East with marketing headquarters, candling and storage rooms and a well developed sales organization in the New York City market.

As noted on the legends under the accompanying pictures, the winning hen laid 289 eggs

Part of Winning Pen No. 93 at the Vineland International Egg-Laying and Breeding Contest, 1923. Official Score 3998 eggs.

birds were placed along the sides of the flag-draped pavilion.

Prof. James E. Rice, head of the college poultry department, declared that the quality of the birds exhibited was even better than that of last year, and Professor Powell of the poultry staff, who was in charge of the Egg Show, said that the same was true of the eggs exhibited.

Promoted by the College of Agriculture, this show was conducted as a state-wide educational project and demonstration in the judging of birds for egg production, for meat production and the judging of eggs. It also serves to facilitate the widest possible distribution of the best quality of poultry for breeding purposes. The motto which governed the show summed up its purpose, "To make the useful more beautiful, and the beautiful more useful, is the highest aim of the poultry breeder."

Some of the more outstanding differences of the show compared with most poultry exhibits, were that the college poultry department staff judged the birds with regard to the production values and essential breed characteristics, the former being given the major consideration. Then, instead of roping off the cages as is customary during judging, exhibitors and visitors were given the opportunity of seeing the judge handle the birds and of hearing the reasons for the placing. As the judge examined the birds, his assistant made note of the outstanding faults, and this statement was delivered to the exhibitor. Another feature was that on the last day of the show an exhibitors' judging contest was held in order to test the ability of exhibitors in selecting birds.

Entries of any specimen of a standard breed could be made by New York poultrymen. Separate classes were provided for both certified and uncertified birds without trapnest records and for both certified and uncertified birds with trapnest records. These classes were divided into separate exhibits of cocks, hens, cockerels, pullets, old pens, young pens, pairs and farm flocks. Entry fees were charged at the rate of 50 cents a bird, and for the eggs at the rate of 25 cents an entry. Practically all of the utility breeds were represented.

Competition in the Egg Show was especially keen and classes called for exhibits of one dozen white eggs, one dozen brown eggs, one dozen whitest eggs, one dozen brownest eggs, one dozen heaviest eggs and three dozen whitest eggs in cartons, from any standard variety. "It is important," Professor Powell said, "that poultrymen in this State give more attention to the appearance of eggs sent to market, in order to successfully compete with eggs from other parts of the country."

The Rice Trophy cup for highest honors determined by the total number of prizes won by any exhibitor was captured by J. D. Rogers, Oxford, Chenango Co. Four other cups awarded by the Cornell Poultry Association, one each for the best cock, cockerel, hen, and pullet in the show, were won by A. C. Len-

Co., for best dozen white eggs, and to C. S. Robinson, Trumansburg, Tompkins Co., for best dozen brown eggs.

During the show the N. Y. Cooperative Poultry Certification Association, the officers and members of which are practical poultrymen, maintained a booth in the pavilion to explain the present plan of certification inasmuch as the College of Agriculture has given over the responsibility for this work to the poultrymen of the State.

One of the most popular features of the show was the plan of holding evening meetings for exhibitors and poultrymen at which different members of the college poultry staff discussed various phases of production poultry. On the last day an auction was staged for the sale of some of the birds.

Summary of Awards by Counties

Tompkins County led in number of points won, with 317. C. S. Robinson led the Tompkins County exhibitors with 85 points. Other exhibitors from Tompkins County to win points were G. M. Brill, Henry Holtkamp, F. W. Adams & Son, H. F. Patterson, W. I. Myers and H. S. Mills.

Chenango County came second with 135 points. J. D. Rogers and W. H. Rogers were the only exhibitors from Chenango, the former leading all exhibitors in points won, by 103.

Tioga County was third with a total of 107 points. Charles P. Leasure led this delegation with 50 points. Other exhibitors were R. A. Heller, W. H. Stoughton and G. H. Thompson.

Wyoming County totaled 85 points, F. L. Steward leading with 52 points. Royce Knox and L. H. Robinson also exhibited from this county.

Chemung County only had two exhibitors who totaled 84 points, J. E. Gregory, winning 49 and R. L. Clark 35.

A. C. Leneker, of Montgomery County, was the only exhibitor from his county, being awarded 67 points.

Chautauqua County was represented by six exhibitors, W. H. Hand and J. A. Carlson tying with 12 points each. Other exhibitors were Gordon Farms, H. B. Irwin, F. V. Stein and D. A. Williams.

Willow Brook Poultry Farm led the Schuyler County representatives with 33 points. P. L. Gabriel and Seymour Bulkley brought the total up to 53 points for the county.

W. I. Trask and Mrs. C. R. Whitekar totaled 48 points for Alleghany County.

W. B. Silver and R. S. Whitehead made a total of 44 points for Franklin County. Mrs. E. H. Jennings, who was awarded 35 points, was the only exhibitor from Livingston County.

W. S. Lyon, F. B. Miner and J. B. Stebbins totaled 32 points for Seneca County, the two former tying with 14 points each.

Schenectady County was represented by only one exhibitor, Mrs. M. K. Baker, who was awarded 27 points.

"Lady Bountiful"—High Bird in the Vineland International Egg-Laying and Breeding Contest, 1923. From the Winning Pen No. 93. Official Score 289 eggs.

in the twelve months period, while the winning pen made the official high score of 3,998 eggs. This latter record was 144 eggs above the nearest competitor.

MORE ABOUT KILLING POULTRY LICE

IN your issue of November 24, W. T. R. gives an account of a cheap remedy for lice. I use old crank case oil, but to each gallon of oil I add about a quart of crude carbolic acid. This increases its efficiency as well as serving as a disinfectant. The dropping-boards are also painted with this material. The boards are cleaned more easily after being oiled.—C. R. W., Penn.

Selecting Breeding Cockerels.—The proper time to select cockerels for the following breeding season is during the fall and winter months. People who intend purchasing cockerels have a better opportunity to get better birds now than next spring when the supply is practically exhausted.

Your paper is excellent. Articles by Jared Van Wagenen are worth the price of the subscription, to say nothing of all the other good things.—J. E. T., N. Y.

Vigor

Vigor is one of the most important characteristics of a dairy cow.

VIGOR IN HOLSTEINS MEANS --

Less trouble to the dairyman at calving time -- fewer losses from cows or injury to cows through calving -- stronger, healthier calves at birth -- more rapid gains in the offspring from calfhood to maturity -- large, steady production under adverse conditions.

A Giant Who Works For You

There is a giant who works tirelessly to lighten the labor on the American farm, to make the farm more productive, and farming more profitable.

He is personified by the vast resources of the Ford organization, whose herculean labors are directed primarily toward lowering the cost and increasing the efficiency of Ford cars, Ford Trucks, and the Fordson Tractor.

The larger this giant has grown the lower the prices of Ford products have fallen, and the more valuable they have become from the investment standpoint as farm equipment.

To the farmer this has meant lower and lower farm costs, better arrangement of farming activities, more money crops, all with less effort and therefore with greater net profit—proof enough that it is to his interest to standardize on Ford equipment.
